(15.) Junior Colleges—My report says junior colleges are needed. The University said the time was not ripe for them. The State Board says that they are needed and are practicable (pp. 28-31).

(16.) Relation of University to High Schools—The point in controversy between the University and my report was whether high-school inspection should be for the purpose of accrediting. I said it should not be; the University said it should. The State Board says it should not and that University inspection should be continued "for the sole purpose of improving the quality of instruction in the subjects each community decides to place in its high school" (p. 31). I recommended a further reason—namely, that the University should ascertain whether its graduates are efficient teachers and whether its University teaching of them was efficient.

(17.) Foreign Language Requirements—One of the most serious controversies was as to whether the foreign-language requirements should be abolished. The University said it would be harmful to abolish them. I recommended further study before abolishing. The State Board recommends abolishing—"a State university should provide regular courses leading to graduation and degrees without foreign language requirements of any kind" (p. 32).

(18.) Student Contact with Strong Men—The State Board agrees with my report and goes even farther and urges that "some plan be provided for bringing under-classmen into more frequent contact with the strong men of the faculty in all departments." The Board's report also says that under-classmen are now "deprived of the inspiration that may come from more or less frequent contact" and that this lack of proper contact is one reason for so many dropping out before they reach the upper classes (p. 33).

(19.) University High School—The cause of the most bitter attacks upon the survey. My report recommended that the high school be given to the public school system of Madison as Teachers College has given the Speyer School this year. The Board said that the school should be allowed to "demonstrate its usefulness and efficiency before judgment is passed." My report said that the teaching and administration were inefficient. The Board says: "Investigation shows that further attention to these matters is necessary" (p. 33).

(20.) Size of Classes—The Board used the survey's figures and agreed with my recommendation that "only such small classes should be continued as are fully justified upon investigation" (p. 34).

(21.) Military Drill—The Board recommends no change. My report recommended substitution of optional for compulsory drill (p. 34). This latter plan is favored by the commandant in charge of military drill, by the department of physical education, by influential regents, and by important educational officers.

(22.) Length of School Year—I recommended four quarters of twelve weeks. The Board recommends investigation of how it is working, of the State's demand, etc.

(23.) University Extension—The Board agreed with me in general praise of this work. It also agreed with me that "now better organization and more systematic management of the Extension Division are demanded and that the instructional force should be strengthened" (p. 36).

This is the end of that part of the report which was written by a small committee of the Board, contributed to slightly by two members of the Advisory Committee, and never submitted to either the full Board or the full Committee.

Surely no person who can read English finds in the report thus far any evidence that it "stands by the University in all the essentials of controversy."

The Board's report extends from page 9 to page 37. From page 39 to page 142 is matter not written by the Board's committee, not submitted to some of them, not submitted to the majority of the Board, or to any of the Advisory Committee. Even this matter does not stand by the University in all the essentials of controversy. Whoever says so does not read the record.

(1.) Land Values Wasted—Pages 39-58 contain a vast amount of detail, much of which was in my files and which it did not seem worth while to print. The Board reached a different conclusion from mine as to the value of condemnation proceedings. Its evidence is not conclusive, although it expresses an opinion that no advantage is shown "resulting from a resort to condemnation." I doubt if the *Nation* wants to stand by the comparison (p. 57). The Legislature was unwilling to accept the Board's conclusions and appointed a legislative committee which is soon to report.

(2.) University Building Programme—The Board says: "A study of the present use of class-room space shows a high percentage of non-use in certain cases" (p. 62). That agrees with my report. The reports and charts later referred to by the Board are those made by the survey. The Board further recommends "the fullest use consistent with educational efficiency"—so did I. It says the study by the University of the reports and charts made by the survey "will result in a larger use of the present buildings." In fact, it goes so far as to say that with two exceptions "for which provision has already been made, no additional buildings for instructional purposes will be required, at the present rate of growth, for several years."

(3.) Dormitories—The Board recommends that precedence be given to building dormitories—so did I. It also recommends that "in the assignment of accommodations in dormitories the requirements of the Legislature be followed rigidly in giving preference to the students from this State"—so did I (Board's Reports, p. 62).

(4.) Business Organization—Pages 63-142 are given to a lot of material that serves a valuable historical purpose. Most of it is lifted straight from University documents. Most of the charts, including the diagram opposite page 70, were prepared at the survey's request and will be found in our files. This matter is descriptive and not controversial with few exceptions. Had I been given a chance, I could have called attention to the fact that the student totals on page 71 included short-term as well as long-term students, and gave an inflated impression of cost base. On page 83 the cost of research and on page 85 the per capita cost of instructional work are given and are sufficiently incorrect so that they disagree with the University's own figures in answer to my report. They are considerably lower than the figures given recently by the University to the Legislature. The budget procedure described is not the procedure followed. It fails to show, for example, defects in budget procedure which have since been corrected as suggested in my report or other defects not corrected, such as that the budget requests for the next biennium went to the Legislature and Governor without first going to the regents—as stated in the first paragraph of the syllabus that went to the Legislature.

The junk of blanks and forms that give the impression of business-like procedure is characterized on pages 124 and 126 by the chartered accountants, Marwick, Mitchell, Peat & Co., in their official audit report as part of an accounting system which (a) is maintained more on a cash receipts and disbursements basis than on an income and expenditure basis; (b) makes it impracticable to prepare a statement showing the financial position of the University; (c) records no accruals of revenue or expense; (d) is not in accordance with modern methods, being particularly deficient as regards provision for effective accounting control over students' fees, etc.

Thus even here, in spite of all the "trappings and the suits" of business efficiency, this report supports my report.

That is all that is in the report called the State Board's report. Any one who has told you that by any specific reference the Board has supported the University in the matter of the controversies has deliberately or unconsciously misinformed you.

There is one sentence only that could give

any color to your statement. If you will find how it happened to be run in the State Board's report and how much the University had to do with it, you will find opportunity for a new crusade. That sentence is on page 36: "In several particulars the Board of Public Affairs does not accept either the conclusions or findings of one or the other [forty] of the investigators employed by it; but either because of want of full information or for other satisfactory reasons this Board withholds specific recommendations."

The record shows that there are two reasons—(1) that most of the Board were running for office and had no time to read the detailed reports; (2) that the University had enough personal influence to prevent the Board's going over the detail. The Board does not pretend to have gone over the detailed reports, and will write you quite frankly to that effect. The working papers are so clearly marked that it would have been easy to check the facts.

WILLIAM H. ALLEN.

Madison, Wis., June 14.

[The implication that the *Nation* has any personal grudge against Mr. Allen or anybody else in Wisconsin is, of course, merely ridiculous. In justice to Mr. Allen we publish his letter. We cannot give space to a long controversy on the matter, or to a restatement of the situation. Careful inquiries among correspondents in whose judgment we have the utmost confidence convince us, however, that the position taken by the *Nation* is in essentials correct.—ED. THE NATION.]

AN AMERICAN HISTORIAN.

TO THE EDITOR OF THE NATION:

SIR: In reading your semi-centennial number I was interested in Mr. Thayer's account of historical production since 1865. It may be that the exclusion of John B. McMaster from among the leading American historians represents an ecumenical judgment—at least as Harvard is popularly supposed to deliver it. But is it to be received? Certainly Mr. McMaster is not "machine made"; academic Germany had no influence on him; his early interests were those of the civil engineer; and he is the one professor of American History whose reputation is not based on the making of textbooks and pedagogical impedimenta. As he holds the first chair of American history established in the United States, so it is recognized that "no writer of our time has taken more pains to reach the ultimate basis for knowledge of the history of our country; . . . Throughout ten laborious days he has been hewing roads through the wilderness in order that others might easily travel" (Prof. A. B. Hart). Without the prestige of the social position and wealth of Adams and Rhodes, McMaster worked alone and revolutionized the writing of American history, and certainly has been no man's disciple either in method or in style. To a former student of Professor McMaster and a reader of the *Nation* for thirty years the omission to mention his contribution to our intellectual life seems extraordinary.

I am aware of the fact that no writer under the circumstances could do more than indicate the general features of historical production. But if Stubbs has to be referred to, why not Henry C. Lea also? Is it nothing for an American to have thrown light over large tracts of ecclesiastical thought and practice? The *Nation* knows what Lea thought of it and how valiantly the latter stood with Mr. Godkin in those early battles for civil and municipal reform. The *Ledger*, the other day, expressed wonder at the inability of Philadelphia to retain its men of distinction. Your contemporary may find an explanation in a letter dated July 3, 1863, written by Col. Charles Russell Lowell to Miss Shaw, his future wife: "Comfortable times are not the ones that make a people great—see what too much comfort has reduced Philadelphia to." But McMaster and Lea survived the comfort; and there are many Philadelphians who hope Mr. Thayer will not take too literally Henry Adams's observation that our traitors were fewer than our geniuses.

JOHN L. STEWART.

South Bethlehem, Pa., July 16.

WARSAW.

TO THE EDITOR OF THE NATION:

SIR: In discussions of one of the most mooted questions of the war—that of the attitude of certain belligerents towards treaties—it is not surprising that well-known doctrines of Machiavelli should occasionally have been cited. But the great Renaissance thinker's ideas on the science of warfare are scarcely less interesting than those he has given us on statecraft.

In view of the fall of Warsaw, the following lines, from the thirty-seventh chapter of the third book of Machiavelli's "Discourses on the First Decade of Livy," are not without interest:

". . . No towns are to be defended save those whose loss necessarily involves your ruin. . . . Provided your army be kept together, you do not, in losing what you voluntarily abandon, forfeit your military reputation, or sacrifice your hopes of victory."

GEORGE B. WESTON.

Harvard University, August 6.

HISTORICAL PICTURES.

TO THE EDITOR OF THE NATION:

SIR: On visiting the Metropolitan Museum the other day I observed with regret that Bierstadt's The Rocky Mountains had been hung on one of the staircase landings. Doubtless it has been here for some time, but it is not too late to hope that this sojourn on the staircase is not a temporary stop on the way to the cellar. Whatever its artistic qualities this picture is a most interesting and characteristic one, and should always be on view at the Museum.

There are in the Metropolitan, as in every Museum, many pictures which are chiefly interesting for their significance in the history of art and civilization. Leutze's great picture of Washington Crossing the Delaware ought always to hold its place, whatever may be thought of its artistic value. It is a wonderful embodiment of the heroic Washington, a splendid production of the legendizing period of our country's history. We would not have one single item different, even the watch-fob of the father of his country. Such a picture explains a period of our country's history better than hundreds of textbooks; that period in which Washington was a demigod, in which the makers of the Constitution were mythic heroes, and the principles of American democracy the divine ideals of our national life. We need a picture of this kind to enable us to understand and to interpret not merely the mythical period of our political life, but also its heroic period.

In something the same way will the student of art and culture always look at Bierstadt's Rocky Mountains. One of the dominant American ideals from 1800 to 1850 was the grandiose conception of the American Scene. Not only here, but abroad, was America the country of the vast wilderness, of the astounding cataract, of the inland sea, of the awful and inaccessible mountain top. The American Forest, the Great Lakes, Niagara—not to say the whole conception of the Hudson River School—was as much a part of our national life as the heroic Washington, the divine Constitution, the inerrant fathers of the Republic. The Rocky Mountains were for many years typical of the ideals of America.

We have got past the Rockies now, and know them more as they are—as we know Washington, the Constitution, and the fathers of the Republic. But the record of our fathers' feeling should be preserved and honored.

This picture of Bierstadt's formerly hung in the place now occupied by Church's Heart of the Andes. The two pictures represent in perfection the final product of that grandiose conception of romantic landscape in America which is so strong an element in Bryant and Irving, in Cooper and Willis, and which is represented in American painting by Cole, Durand, Kensett, the elder Weir, Moran, as well as Bierstadt and Church.

Of this epoch in American art the Museum possesses these two typical and perfect pictures of Bierstadt and Church. It has also admirable specimens of Durand and Kensett. It still lacks fine examples of Cole, of the elder Weir, of Thomas Moran. But the student of American art ought some day to be able to pass from the two characteristic pictures by Wilson in the Hearne Collection to some really typical specimen of the early work of Thomas Cole, who was so much influenced by Wilson; he should then be able to study the slightly later work of Durand; and he should be able finally to note how the different elements to be seen in these earlier masters mingle in Weir and Kensett, and finally produce in Moran, in Bierstadt, and in Church pictures so typical of the national mind and character that no change of artistic ideals can ever make them negligible.

The Museum has rich material for the study of American landscape after 1850. But of the earlier phases—and these are more truly American if less artistic—there is not nearly enough as it is. There are two excellent pictures by Doughty, but there is nothing by Fisher, his contemporary, who is really a more important figure in the development of American landscape. There is nothing by W. G. Wall or Bennett. There is no really satisfactory picture by Cole. The Oxbow is representative of a good deal in Cole's method of painting, which is interesting, but is not at all representative of his ideal of romantic landscape, which is the most interesting thing about him.

I long to see the Museum increase its representation of this phase of American landscape, not diminish it. There used to be on one of the landings a number of Kensetts which have now disappeared. This is as it should be; the Kensett which remains is a

typical presentation of a scene that was classic in American landscape. Bierstadt's Rocky Mountains is also a classic and one of far more importance.

No other picture by the painter is so typical of the national feeling of its day. The Lake Corcoran in Washington would be as good but for the accident of its subject. This picture is perfect of its kind; no other picture can ever take its place. Some time, perhaps, the authorities of the Museum may find a place for it where its representative significance will be fully grasped.

EDWARD E. HALE.

Union College, Schenectady, N. Y., June 16.

THE HOUSE OF THE SEVEN GABLES.

TO THE EDITOR OF THE NATION:

SIR: May I call to your attention the present condition of the House of the Seven Gables, which you speak of as "virtually uncared for"?

Several years ago it was purchased by a well-to-do citizen of Salem, and she has put it into as nearly as possible the original order. When the tourist opens the door of the shop, a little bell tinkles and he finds himself in the quaint little hallway, with "Gibraltars" and other small articles for sale. Guides are furnished, and he is taken over the entire house. The secret stair is climbed, with some difficulty; the scenes of various incidents in the romance are pointed out. Already, since its opening, several thousand people have visited it.

Another house of ancient lineage has been moved to the adjacent lot, and here settlement work is carried on, for the benefit of the foreign population which now occupies that part of the city. The Seven Gables Camp is also maintained in New Hampshire by these settlement-workers, and thither the children of the neighborhood are taken for periods during the warm months.

Thus the House of the Seven Gables is not only a shrine for the literary tourist, but also a civic centre for the training of our future citizens.

CAROLINE H. TAYLOR.

Salem, July 31.

"LIGHT UPON THE WIND."

TO THE EDITOR OF THE NATION:

SIR: A correspondent in your issue of July 1, referring to Tennyson's expression "O light upon the wind" ("Passing of Arthur," line 46), asserts against other authorities that "light" should be read as the adjective and not as the noun. It hardly seems that there can be any question about this reading, for Tennyson must surely have had in mind those other ghosts, more famous than Gawain, in Dante's best-known episode (Inferno, Canto v, line 75), Paolo and Francesca, who "seem to be so light upon the wind" (*paion si al vento esser leggieri*).

A correspondent in your issue of June 17 ("A Neapolitan Jacky-My-Lantern") refers to "the ancient Greek prototype of Mark Twain's 'Jumping Frog of Calaveras County.'" That is a joke which seems to have been too much for Mark Twain himself, who, because his delectable myth was retold for translation into Greek in the well-known "Introduction to Greek Prose Composition" by Arthur Sidgwick (Part I, Exercise xxi), apparently believed that a story similar to his was to be found in ancient Greek.

A similar hoax may be worth mentioning, perpetrated by Browning in "Aristophanes' Apology" (line 1078), where the modest Athenian lad is represented as singing "some grave romaunt"—

> How man of Mitulene, wondrous wise,
> Jumped into hedge, by mortals quickset called,
> And there, anticipating Oidipous,
> Scratched out his eyes and scratched them in again.

The only Greek original for that may have been discovered by Browning in the delightful classical version of a familiar nursery-rhyme ("There was a man in our town" or "The Man of Thessaly") by Samuel Butler, Bishop of Litchfield (printed in "Arundines Cami," Cambridge, 1843):

> Ἐξ οὐ τυχόντων Θέτταλός τις ἦν ἀνήρ,
> ὃς ἔργον ἐπεχείρησε τλημονέστατον·
> ἀκανθοχηνοκοκκόβατον εἰσήλατο,
> δίσσας τ' ἀνεξώρυξεν ὀφθαλμῶν κόρας.
> ὡς οὖν τὰ πραχθέντ' ἔβλεπεν τυφλὸς γεγώς,
> οὐ μὴν ὑπέπτηξ' οὐδέν, ἀλλ' εὐκαρδίως
> βάτον τιν' ἄλλην ἦλατ' εἰς ἀκανθίνην,
> κἀκ τοῦδ' ἐγένετ' ἐξαῦθις ἐκ τυφλοῦ βλέπων.

Geneva, N. Y., July 16.

Literature

A YEAR AGO.

The Diplomacy of the War of 1914: I: The Beginnings of the War. By Ellery C. Stowell. Boston: Houghton Mifflin Co. $5 net.

For any accurate history of the military events of the great war we must probably wait for years until the staff orders and reports have been studied. The case is different in regard to the diplomatic history. Now that all the principal Powers have published their white, orange, red, gray, blue, and yellow papers, we are in a position to know pretty nearly as much of the international relations in the days immediately preceding the war as we shall ever know. It is possible to subject these papers to an analysis with the hope of reaching fairly complete and final conclusions. This is what Mr. Stowell has done in an admirably clear and impartial fashion. After a good brief review of the main factors in European history from 1814 to 1914 he comes directly to the analysis of the documents following the Serajevo tragedy until August 5, when the English Ambassador at Berlin received his passports.

The author's method is good. He divides the whole subject into topics according to countries, and under each topic gathers together all pertinent extracts from the documents, connecting and explaining them with criticism of his own and of others. In appendices he reprints conveniently many other documents which bear on the question. Thus he lets the sources speak for themselves and lets the reader have the benefit of all the interpretation and comment which is worth while.

Mr. Stowell rightly regards as the chief underlying cause of the war the disturbance of the balance of power between the Triple Alliance and the Triple Entente. The agreement of the English and Russians in Persia, the coöperative Anglo-French naval arrangement, the military reorganization of Russia, and other factors had strengthened the Triple Entente and made it clear that time was working against the Triple Alliance. Furthermore, the Triple Alliance had been weakened by Italy's desertion of Germany at Algeciras, by Italy's attack in 1911 on Germany's Turkish friend, and by the settlement of the Agadir affair, which Germans regarded as a diplomatic defeat for Germany. Even German papers, indignant at the Kaiser's efforts for peace in that crisis, had not hesitated to speak of William the Poltroon. Another blow was dealt to the Triple Alliance when the Balkan allies carved up the Turkish territory in Europe. The crime of Serajevo came as the last straw. Germany and Austria felt that they were face to face with a dilemma: either they had to resign themselves to further loss of prestige and to the increase of Russian influence in the Balkans, thus endangering the existence of Austria, or they had to regain prestige by teaching Servia a lesson, even though in so doing they were risking the peace of Europe. The German Foreign Office did not know the exact terms of the Austrian note to Servia before it was presented, and found it convenient not to know them, for it could then maintain with a better face that the dispute was purely between Austria and Servia, and ought to be localized. "It seems most probable that Germany did not really wish to force a war, and that her real purpose was to secure a diplomatic triumph and force the Entente Powers to recognize the paramount influence of Austria in Servia" (p. 123).

As to the immediate responsibility for the war, Mr. Stowell holds that Servia was blameless. As to Austria and Russia, either might easily have obviated the contributing causes of the conflict, Austria by consenting to modify the terms of her note to Servia, and Russia by refraining from her premature and unnecessarily hasty steps towards mobilization. "By this premature mobilization Russia did, I believe, throw away the last remaining chance of peace" (p. 486). This is all the more to be regretted as Russia had up to July 29 maintained a very conciliatory attitude. For Sir Edward Grey the author has, and rightly, the greatest admiration, believing that he did everything reasonably possible to prevent the widening of the conflict beyond Servia and Austria. Instead of heaping blame upon him, like Bernard Shaw, Mr. Stowell thinks he ought rather to be awarded the Nobel Peace Prize for his very active, untiring, and intelligent work to preserve peace.

Perhaps the most valuable chapter is that on the complicated question of the origin, character, and obligations connected with the neutralization of Belgium. Mr. Stowell makes it clear that it is not quite accurate to say that England came into the war because of Germany's violation of Belgium's

neutrality. For on August 2 Grey's formal pledge to France that England would protect the French coast against a German attack may be looked upon as a conditional declaration of war. "A more accurate statement is that when Germany violated Belgium's neutrality, England decided to change from partial and specially restricted intervention in the war to a general engagement of all her forces against Germany" (p. 351). And this change was due as much to the necessity of protecting England's vital interests as to her obligation to maintain her guarantee of Belgium's neutrality. The author's discussion of the neutralization of Belgium, with its many-sided problems, is rich in suggestions for those who believe it desirable that the United States should seek to obtain the neutralization of the Philippines.

In his closing pages (491-515) Mr. Stowell has some very sensible remarks about the Kaiser's responsibility, German "mental mobilization," and "nationalistic myopia," and the strengthening of international as opposed to national ideals which he hopes is to be one of the fruits of the war. While rejecting as impracticable many of the half-baked schemes of the pacifists, he calls attention with approval to the "super-empire" which England has been forming with the United States by her acquiescence in the Monroe Doctrine, with Japan by the treaty of 1902, with France by the naval arrangement as to the Mediterranean and the North Sea, and with Russia by the spheres of influence and buffer strip in Persia. The basic idea of this super-empire is that the interests of all in every part of the world shall be cared for by the representative able to act on the spot in the most effective manner—all for the purpose of securing a reasonable observance of the rules of international law. It allows each coöperating empire to restrict its armament to the minimum required for the defence and development of the interests to be protected in its immediate sphere.

Of unfavorable criticism there is little to be said except to warn the reader that the "Conclusions" and "Questions and Answers," though expressed with much nicety, do not always precisely accord with, or quite reach, the admirable impartiality of the author's main treatment in connection with the documents. In the chronological table of events some attempt should have been made to arrange the events by hours as well as by days. There is no sense in indicating (p. 683) as the first event on August 2 the German ultimatum to Belgium, which, in fact, was not presented until 7 P. M.; the first item should doubtless be the German violation of Luxemburg, which took place "very early" on that day. Telegraphic action took place so swiftly at that fatal time that hours were more important than days under ordinary conditions. It is only by having before us the precise moment at which things were said and done that we can place ourselves in the position of the chief actors and judge of their motives. Though otherwise generally accurate in detail, one should read 1882 for 1883 (p. 8), August 10 for August 6 (p. 29), 1634 for 1609 (p. 372), and Dumouriez for Maurier (p. 375).

On the whole, students are likely to find this the most helpful and generally satisfactory volume on the immediate causes of the war which has appeared in English, and will look forward to the two following books planned by the author, one on the diplomacy during the war, and one on the negotiations which will some day bring the war to a close.

CURRENT FICTION.

Pieces of the Game. By the Countess de Chambrun. New York: G. P. Putnam's Sons.

To prove the innate patriotism of the American writer, it is only necessary to observe that, in the thousand and one books written on international marriage, the abused and misunderstood member of the union is, nine times out of ten, a son or daughter of this country. It is just barely possible that there is something to be said on the other side, and this conclusion becomes reinforced by a reading of Clara Longworth de Chambrun's latest effort. An American girl, of excellent family and great personal charm, marries a young French diplomat stationed at Washington. The girl has not only charm, but brains and stamina as well, being, on the whole, an unusually good example of what we are pleased to characterize as the "typical American girl." Her husband has all that she has and a trifle more in the shape of poise. The match is of that type known as "love, there being no wealth or need for social ambition on either side." Why, then, was the result what it was? No direct answer is given, but the author evidently desires to convey the impression that there is a wide gulf between the American and the Old World point of view. Except in isolated cases, there is and can be no common ground between them, for there is no common background. The pettiness of American society is utterly incompatible with the broader outlook of the old nobility. But generalization upon such a subject is unsafe. One is reminded of the showman's reply to the question which would win in a fight, a lion or a tiger. "It all depends on the particular lion and the individual tiger you have in mind."

On Desert Altars. By Norma Lorimer. New York: Brentano's.

Wives who sell themselves to buy their husband's health or success or happiness are getting to be among the more familiar assets of current fiction. The question as to whether wives should or should not do that kind of thing apparently remains open. It is still an unconventional kind of thing to do, but precedents are multiplying rapidly (in fiction), and conventions are a matter of precedent. Already we have reached that point of advancement at which husbands, after some natural revolt, perceive that they have to choose between two kinds of fidelity, that to the body and that to the spirit. If a wife sees that her husband needs more pills or political offices or social amusement than he can get, she will naturally set about getting them for him. And the more perfectly she loves him the greater the sacrifice she will make. She is a thinking being, isn't she, and the equal of man, and able to choose? Hence the situation. Now, the present story-teller does not go so far as to assert that her English Alice is to be commended for selling herself to a rich Jew. But she plainly thinks it a quite natural and, on the whole, excusable error. You see, Alice's engineer husband is dying of African climate, but cannot come home for lack of a job there. The rich Jew tells Alice he will find him a job if——, and Alice succumbs. There is a half-Jew baby, but it dies in time to remove one obstacle from the forgiving path of the engineer husband, who, though restored to health, has been greatly put out by the discovery of his wife's sacrifice. In fact, he has turned her out of his house. But when he does see reason, he sees it with both eyes, and speeds with both feet to the only woman he has ever loved. His amends are really very handsomely made. "You were always wise," he says, "wise and clear-minded." But no. Alice will not quite have that. It is clear to her that she has "made a mistake—that my judgment had been at fault; that what I had considered as justifiable, under the extreme circumstances, a husband could not forgive." However this may be, it is now himself that her husband cannot forgive: "I want you, but I am totally unworthy, dearest. It is for me to implore you to take me back—to forget my brutality." So she takes him back. There hangs about the story an aroma of spinsterly eroticism.

Millstone. By Harold Begbie. New York: George H. Doran Co.

The author assures the reader, in his epilogue, that he has had no intention of writing anything here but a story: "While I was writing the book, absorbed in the temperaments of my characters, there came to me by a strange chance irrefutable evidence of a most terrible nature concerning the depths of degradation into which quite little children are forced by monsters to whom vice is only a means of earning money. I could not prevent myself from writing more earnestly, more courageously, yet I finished the book in the spirit which conceived it; no shadow of a purpose was allowed to cross its pages." Whatever may be true of the spirit of the author, his book is a tract. At the beginning we seem on the way to an interesting study of a repentant criminal; and even after he turns out to be a religious crank there is hope of him as a study for a novelist. But he has been a trafficker in the bodies of women and children; and the best that Mr. Begbie finds it possible to do for him is to see him well murdered at the hands of a victim, and then to set about his real business (whether or not he is con-

scious of it)—exposure by means of a concrete illustration of the immoral trade in children, about which, he says, even persons organized to fight the white-slave trade are for the most part ignorant. The details of his special instance are horrible enough, and deserve, no doubt, to be dwelt upon as representative of a widespread horror. Who will go into such matters? How shall they be got before the public in such form as fairly to rouse that apathetic beast? One cannot wonder that novelists of serious mind are doing what they can to answer these questions by means of their own vehicle. Nevertheless, the novel is not at its best as a vehicle. Such a theme as Mr. Begbie has here broached could be material for art only in the greatest hands. It is the kind of theme the New York stage was engrossed with a season or two ago—lamentably, so far as the art and dignity of that stage was concerned. A tract may be more effective for the moment when tricked out in the dress of fiction or the drama; but play and novel suffer in the process.

A NEW EDITION OF HERRICK.

The Poetical Works of Robert Herrick. Edited by F. W. Moorman. Oxford: Clarendon Press. 12s. 6d. net.

Fairly good texts of Herrick were not lacking, but it is a delight to the scholar and to the lover of poetry to have the "Hesperides" and "Noble Numbers" added to the beautifully printed critical editions of the Clarendon Press, which already included Spenser and Milton and other great names. The editor chosen is particularly suited for the task by his work on the "Biographical and Critical Study of Robert Herrick," published in 1910. It has been known that copies of the *editio princeps* of 1648 showed certain variations, due probably to corrections made by Herrick himself, while the sheets were printing. The first requisite, therefore, was to select for reproduction a copy of this edition which showed the author's later hand. And Mr. Moorman was wise in determining his choice partly on the presence of the word "watry" or "warty" in the second line of the poem to the "Dean-Bourn." Mr. Saintsbury, in preparing his text for the Aldine Edition, had rejected the former as a "conjecture." As a matter of fact, the word actually occurs in some copies of the original, but is cleverly regarded by Mr. Moorman as a printer's error which Herrick saw and corrected as the book was passing through the press. The reading "warty" is thus one of the tests of the better state of the text.

But this was only the beginning. All students of Herrick knew that a number of his poems existed in MSS. and in song books of the age, and exhibited striking variations of form. But only the minute scholar had any notion of the multitude of these variants. All these Mr. Moorman has collated with what appears to be painful exactitude, and he has given a full account of the results in a Critical Appendix, leaving the body of the text in conformity with the *editio princeps*. He concludes from his examination that the more important of the variations indicate earlier versions of the poems, and that Herrick worked over his lines with loving care for many years before submitting them finally to the public. In some cases a poem passed through a number of stages, the chronology of which Mr. Moorman has tracked with notable acumen. We have, therefore, in this critical edition the opportunity of watching a seventeenth-century poet actually at work with file in hand—a rare opportunity, since this labor, if we may judge from results, was lamentably neglected by most of the writers of the age.

It is noteworthy that generally Herrick's self-criticism was in the direction of brevity and precision; in certain poems he even rejected whole stanzas as relentlessly as Gray was to do in another century. But not always. He occasionally added, and, in Mr. Moorman's opinion, he did not escape, now and then, substituting a weaker line for a stronger. One case of this kind is so interesting as to warrant special observation. It concerns the well-known problem which in the "Hesperides" appears thus:

To a Gentlewoman objecting to him his gray haires.

Am I despis'd, because you say,
And I dare sweare, that I am gray?
Know, Lady, you have but your day:
And time will come when you shall weare
Such frost and snow upon your haire:
And when (though long it comes to passe)
You question with your Looking-glasse;
And in that sincere *Christall* seek,
But find no Rose-bud in your cheek:
Nor any bed to give the shew
Where such a rare Carnation grew.
Ah! then too late, close in your chamber keeping,
It will be told
That you are old;
By those true teares y'are weeping.

In Playford's "Ayres and Dialogues" (1653) this poem is printed with fewer lines and under a different title, thus:

To his Mistress, objecting his age.

Am I despis'd because you say,
And I believe, that I am gray?
Know, Lady, you have but your day:
And night will come when men will swear
Time has spilt snow upon your hair.
Then when in your Glass you seek,
But find no Rose-bud in your cheek;
No, nor the bed to give the shew,
Where such a rare Carnation grew,
And such a smiling Tulip too.
Ah! then too late, close in your chamber keeping,
It will be told
That you are old
By those true tears y'are weeping.

Mr. Moorman wonders how the poet brought himself to alter such a couplet as—

And night will come when men will swear
Time has spilt snow upon your hair.

It seems to us probable that the version in the "Ayres" is not from an early manuscript of Herrick's, but rather shows revision from the poet's own hand after the publication of 1648. And certain particulars of the punctuation would seem to indicate that the later (1653) version was printed in accordance with alterations marked by the author in a copy of the 1648 edition. However, this is pure conjecture; and in general we find ourselves in entire agreement with Mr. Moorman's critical views. We cannot deal with other textual questions almost as interesting as this, but must close with calling attention to the small group of poems added from various sources other than the *editio princeps*. We ought to be glad to have these, though none of them shows Herrick in his better vein, and one of them, "Mr. Robert Herricke his farwell unto Poetrie," seems to us of dubious authenticity. The volume as a whole, both for its beautiful typography and for its scholarly editing, is a worthy addition to the series to which it belongs.

AN INDIAN ON HIS RACE.

The Indian of To-day. By Charles A. Eastman (Ohiyesa). New York: Doubleday, Page & Co. 60 cents net.

That this book lacks the literary quality of Dr. Eastman's earlier work is due, doubtless, to its being an essay in the less congenial field of history and statistics; and the infusion of poetry and color into a compendium of this kind is made doubly difficult by its condensation into a pocket volume.

In his endeavor, as an Indian, to contrast his own race favorably with the Caucasian, the author naturally touches on the question of drink, asserting that "the original North American knew no fermented or spirituous drink," and thus contradicting some writers who have described the aboriginal production of ferments from corn and berry juices. He charges the practice of indiscriminate scalping to the offer of bounties by the colonial governments, notably in Massachusetts and Pennsylvania, bent on the extermination of their red enemies. The introduction of the Indians to an indoor mode of life he holds accountable for the ravages made among them by bronchitis, pneumonia, and tuberculosis. They were, he declares, "a God-fearing, clean, and honorable people before the coming of the white man," notwithstanding that the Jesuit priests, in their "zeal to gain honor for their society for saving the souls of the natives," found it "almost necessary to represent them as godless and murderous savages," since "otherwise there would be no one to convert." Nevertheless, he elsewhere lays stress on the statement that "it was the Christian missionary, in spite of serious mistakes, who played the most important part in the transformation of the Indian and the development of the West." And, though he ascribes most of the race wars to the land-greed of the white pioneers and the Government's loose way of making and enforcing its treaties with the tribes, he admits that in some cases the trou-

blcs were brought on by the bad faith of individual Indians.

One of the popular misconceptions which Dr. Eastman tries to correct is as to the position of woman in the old tribal system. She was always, he says, "the silent but telling power bchind life's activities," and "shared equally with her mate the arduous duties of primitive society":

Possessed of true feminine dignity and modesty, she was expected to bc his equal in physical endurance and skili, but his superior in spiritual insight. She was looked to for the endowment of her child with nature's gifts and powers, and no woman of any race has ever come closer to universal motherhood. . . .

She preserved man from soul-killing materialism by herself owning what few possessions they had, and thus branding possession as feminine. The movable house was hers, with all its belongings, and she ruled there unquestioned. She was, in fact, the moral salvation of the race; all virtue was entrusted to her, and her position was recognized by all. It was held in all gentleness and discretion, under the rule that no woman could talk much or loudly until she became a grandmother.

The Indian woman suffered greatly during the transition period of civilization, when men were demoralized by whiskey, and possession became masculine. The division of labor did not readily adjust itself to the change, so that her burdens were multiplied while her influence decreased. Tribe after tribe underwent the catastrophe of a disorganized and disunited family life.

One of the most interesting passages in the book is that which deals with Indian ornamental art. Leaf and flower designs, we are told, are generally modern:

The old-time patterns are for the most part simple geometrical figures, which are decorative and emblematic rather than imitative. Shafts of light and shadow alternating or dovetailed represent life, its joys and sorrows. The world is conceived of as rectangular and flat, and is represented by a square. The sky is concave—a hollow sphere. A drawing of the horizon line colored pale yellow stands for dawn; colored red, for sunset. Day is blue, and night black spangled with stars. Lightning, rain, wind, water, mountains, and many other natural features or elements are symbolized rather than copied literally upon many sorts of Indian handiwork. Animal figures are drawn in such a manner as to give expression to the type or spirit of the animal rather than its body, emphasizing the head with the horns, or any distinguishing feature. These designs have a religious significance and furnish the individual with his personal and clan emblem, or coat of arms.

As a matter of course, Dr. Eastman can find nothing good in the reservation system, and very little in the Indian Bureau. In striking contrast with the fairness he shows in some of his judgments is his reading in the Burke Act of 1906 only the provision "that Indians allotted after that date shall not be declared citizens until after the expiration of the twenty-five-year trust period," with the sweeping comment that "this act has served no particular purpose except to further confuse the status of the Indian"; for in the next paragraph he says: "There is a special law under which an Indian may apply to be freed from guardianship by proving his ability to manage his own affairs. If his application is approved by the Interior Department, he may then rent or sell his property at will." Is it possible that the author of such a textbook on Indians is unaware that this "special law" is a part of the Burke act itself, and was put there for the express purpose of releasing ambitious and thrifty Indians, promptly and without cost to them, from the thraldom in which their childish fellows live?

Our author approves of the disposition of the young Indian men of to-day to marry white women, and finds in the issue of this intermarriage a tendency "towards increased fertility as well as good mentality": a position on a much-vexed question which marks his departure from the common ideals of his fathers, and in the determination of which his personal experience may have been a conspicuous factor.

DR. WYLIE'S LAST WORK.

The Reign of Henry the Fifth. By James Hamilton Wylie. Vol. I: 1413-1415. New York: G. P. Putnam's Sons. $9 net.

Four months before his death on February 28, 1914, Dr. Wylie finished the first volume of "The Reign of Henry the Fifth," a continuation of his well-known "History of England under Henry the Fourth." He belonged to a type of historian seldom found except in Germany. For more than half the span of a long life he laboriously collected from virtually all available sources, whether in print or manuscript, and from French, Spanish, Italian, German, and other Continental writers, historical data of every description for the period 1399 to 1415. The results of these labors are five stout volumes covering these sixteen years. The future historian will do little more than utilize the vast accumulation of material contained in them.

The work shows great erudition and critical handling of the sources, but like the "Henry the Fourth," it is utterly lacking in proportion, balance, and proper emphasis. The author was apparently as much interested in the menu of the king's coronation banquet as in the Parliament of Leicester; in the injunctions of a writer of etiquette not to lick plates with the tongue, or spread butter with the thumb, as in the national administration of justice; in the stories of St. Patrick's Hole, the Irish Purgatory, as in the teachings of the Lollards. The work is a great storehouse of facts bearing upon all phases of life in England early in the fifteenth century, and apparently this is just what the author intended it to be. The style is overcharged and the frequent use of archaic words and expressions to give color to the narrative renders the reading difficult. In dealing with the beliefs and superstitions of the age, the personal equation is often too much in evidence, although there is an improvement in this respect over the author's earlier historical writings. However, after all allowance for these and other deficiencies has been made, it may be said without hesitation that the work will be indispensable for all students of this period, and will be of great value for those who desire a cross section of history for the early part of the fifteenth century. The text and the extensive footnotes contain a mine of information on prices, wages, manners, superstitions, biographical and etymological matters.

Although holding that there is evidence to substantiate in part at least the old story of Henry V's conversion at the time of his accession, Doctor Wylie shows that Henry was far from saintly as a king, that, in fact, he was guilty of trickery, deceit, and sharp practices generally. The conditions in France just before the renewal of the Hundred Years' War and Henry's double dealing with the Armagnac and Burgundian factions are well described. In reference to his proposal to marry the Princess Catherine, the author says: "But we now know that all this time he was busy concocting a counter-scheme that was not merely steeped in prevarication and duplicity, but charged with downright hard, official lies." While signing the truce and making protestations of friendship, he was making active preparations for the invasion of France. The description of these preparations, and particularly of the financial measures adopted, is one of the best portions of the book.

The uprising of Sir John Oldcastle and the Lollards is fully discussed. Doctor Wylie minimizes the political motives which other historians have attributed to these disturbances. Bale's version of Oldcastle's trial, which the earlier writers have usually followed, he shows to be wholly untrustworthy. The chapter on "Godshouses," houses devoted to works of mercy, such as infirmaries, homes for the blind, for fallen women, and the insane, is especially interesting. The volume is furnished with a full index. If the author has left any considerable material for later volumes, it is to be hoped that something may be done by way of posthumous publication.

A WESTERNER OF NEW ENGLAND.

Edward Rowland Sill. By William Belmont Parker. Boston: Houghton Mifflin Co. $1.75 net.

In the half-century since the appearance of "The Jumping Frog" and "The Outcasts of Poker Flat" certain kinds of literature have multiplied, and certain kinds of careers have become increasingly interesting. It is by virtue of the great mass of "Americana," of the fiction and poetry of limited localities, and of the lives of the peripatetics who have cross-fertilized the United States, that the modern American can realize in the concrete how the whole of the country is equal to the sum of all its parts.

The Easterner still knows little about Cali-

fornia. The traveller comes back ecstatic; the stay-at-home sportsman regards with deferent wonder the annual tennis invasions; but what the average man knows of the Pacific Coast, aside from the lore of railways and Pan-American circulars and news items, he learns from the lives and works of story-writers like Bret Harte and Mark Twain, or of educators like President Gilman and Professor Royce, or of poets like "Joaquin" Miller, Millicent Shinn, Ina D. Coolbrith, and Edward Rowland Sill. Of these poets Sill was the most talented and not the least loyal to California, though he was born and bred in Connecticut and lived his last years in Ohio.

After graduation from Yale in 1861 he went out to the coast, by way of Cape Horn. It is polite to say that he was in business there till 1866, though the "business" was now on a ranch, then in a post-office, and during the later years in miscellaneous clerking. At first he was disappointed with the look of things, and after six months he was sick at heart, but he left at last, not out of discontent with the West, but because he wanted to study theology. Neither theology, however, nor the East could hold him, and in 1871 he came back as a teacher, for three years in the Oakland High School, and for eight more in the University of California.

From first to last, therefore, Sill's residence in California bridged twenty-two years. He was there in the '60's, during the transition from the mining to the agricultural stage, when Mark Twain and Bret Harte were still promising young men. Like many others who came out in curiosity, he fell under the spell of the climate and the country and the people. He returned in time to teach Millicent Shinn in high school, to throw in his lot with President Gilman at Berkeley, to engage Josiah Royce as assistant in English after searching for a young man who was well grounded but not opinionated and "with a bit of æsthetics about his brain somewhere." Finally, when his position in the University "had become intolerable for certain reasons that are not for pen and ink," he was slow to shake the dust of California from his feet. He brought back the best of what he had found there, and, like these other teachers and writers, helped to unite the two peoples of the two coasts.

During his last years the love of the West was keen in him. Mount Washington seemed "a very pretty piece of rising ground," the trees were only shrubs, the sky rarely blue, the heat and cold abominable in turn, the Atlantic Ocean "the only thing East that [didn't] seem like a feeble imitation." With its idealism he had brought back the easy hyperbole of the coast. Yet all his life he retained certain quaint New England oddities of thought and diction. He is like Lowell—who is like no Westerner—in his antic fancies, his references to his "pomes," "the near-sighted scum-skinners" who criticise them, the "gew-gaw" parlor organ, or the skim-milk on high which the gods had been using as cheap feed for the sky-terriers. These last years cemented his long friendship with Henry Holt and established a new relation with Aldrich, to whom he sent a steady and anonymous succession of prose and verse for the *Atlantic*.

Those who would like to trace Sill's long struggle between faith and doubt—a struggle typical of his period—or his wide and discriminating reading, or his self-effacing zeal as a teacher, or his fine disregard for contemporary fame as a writer, or his great and true magnanimity as a man—must read all of Mr. Parker's book. It is well presented—an admirable compilation of first-hand material with pleasantly written connecting links. The only feature of it that the poet himself would not commend is a harmless but evident New England complacency from which Sill had been utterly freed by his compensating experiences in the West.

Notes

"Senescence and Rejuvenescence," by Charles M. Child, is announced for publication on October 1 by the University of Chicago Press.

The Macmillan Co. announces that it will publish early in the autumn a book by Col. Robert McCormick dealing with his experiences in the area of war.

Harper & Bros. announce for publication early in the autumn the first books in a new series to be called "America's Best Funny Stories." The first volume will be entitled "Men and Things" and will contain examples of the work of Mark Twain, Bret Harte, Bill Nye, F. Peter Dunne, and other representative American humorists.

We are requested to announce that celebrations in connection with the fiftieth anniversary of the opening of Vassar College will be held at Poughkeepsie during the days October 10 to 13.

"The Guide to South and East Africa" (London: Sampson Low, Marston & Co.), of which the twenty-first edition has just been published, is a remarkable book. Intended especially for the use of tourists, sportsmen, invalids, and settlers, it gives a mass of condensed information on every subject of conceivable interest, including wages, possibilities of agriculture, mines, and other matters illustrating the resources and capabilities of the country. There are numerous colored maps, plans, and diagrams.

How Greater Britain came to be is the theme of the half-dozen lectures by Sir Charles P. Lucas that form "The British Empire" (Macmillan; 80 cents). The author does not confine himself to history. Although he follows step by step the widening bounds of the Empire, his book is an apology also. But it is not blindly "patriotic." He points out the stains, or some of them, upon Britannia's escutcheon. Again and again he records that England "took" this island or that harbor. He does not gloss over her part in the slave trade. Yet upon the most glaring instance of aggression, the Boer War, he makes no comment, contenting himself with narrative. On the whole, he insists, the Empire has not been planned; it has grown. Various causes have combined to create it—a native spirit of enterprise, desire for liberty, for new homes, for propagating Christianity; and when once the game had started, it was necessary to play it out. If the book was suggested by the present war, to which it makes occasional reference, its usefulness as a manual of British expansion is independent of that fact.

Sister Violetta Thurston was sent out in August, 1914, from London by the St. John Ambulance Association, in charge of a party of nurses consigned to the Belgian Red Cross Society for service in Belgium. By the time she and her charges had crossed the channel there was hardly any Belgium left, and they found themselves working day and night for German surgeons under German commandants: "The glorious vision of nursing Tommy Atkins at the front faded into the prosaic reality of putting hundreds of cold compresses on German feet, that they might be ready all the sooner to go out and kill our men." How the nurses did their duty under these conditions, how they tried to get away to France, were caught and sent back, how Sister Violetta finally made her way to Denmark and around by Lapland and the Arctic Circle to Petrograd and the Russian front, and the tremendous scenes she saw there, we should never have learned if she had not secured a fortnight of leisure by getting a shrapnel wound with pleurisy to follow. Written artlessly, "to the continual music of the cannon and the steady tramp of feet," "Field Hospital and Flying Column" (Putnam) has the merit that never fails a sincere bit of autobiography. And the queer moral of it is the sinister charm of war. Sister Violetta, occupied day and night to exhaustion with the most repulsive aspects of battle, hungry, sleepless, unwashed, invaded by vermin, often in physical danger, and sharing vividly the discouragement of defeat, enjoyed to the utmost her part in the great adventure.

"The Way of the Red Cross," by E. Charles Vivian and Z. E. Hodder Williams (Doran), is a different matter altogether. It is put together for two purposes: the profits from sale are devoted to the *Times* Fund for the Sick and Wounded, and the burden of its song is Red Cross propaganda. In spite of the excellence of these two purposes it is not very interesting. Sister Violetta, in bed with her pleurisy, still radiates energy, but Messrs. Vivian and Hodder Williams give the impression of being very, very tired. There is an introduction by Queen Alexandra, "with facsimile of her hand-writing and stationery," and the doubtful grammar of royalty.

Mr. E. Alexander Powell, who represented the New York *World* with the Belgian army at the beginning of the war, provides us in "Fighting in Flanders" (Scribner; $1 net) with as comprehensive an idea of the siege and capture of Antwerp and of the events which led up to it as any future historian can desire. A capable writer as well as a trained observer, Mr. Powell can describe as well as he can see, and one could desire nothing more vivid than his suggestions of scenes in and around the commercial metropolis of Belgium before the Germans actually succeeded in breaking through the ring of defences hitherto regarded as impregnable.

Most valuable of all perhaps is his account, brief as it is, of his talk with Gen. von Boehn, the commander of the Ninth German Army, and the conqueror at Louvain. In it is sketched, perhaps over-succinctly, the attitude of the German authorities towards the alleged atrocities perpetrated by their commands on the civilian population of Belgium, many of which Mr. Powell states that he saw, and himself describes. Perhaps the best commentary thereon is Mr. Powell's open declaration, in his preface, that "I am pro-Belgian; I admit it. I should be ashamed to be anything else." It is at least hard to realize how any one who has read Mr. Powell's book and followed with him the heroic struggle of the Belgian people against overwhelming force, and the horrible suffering entailed thereby, could be anything but a pro-Belgian, even though one might not agree with all his conclusions.

In his little volume "Germany's Vanishing Colonies" (McBride, Nast; 75 cents), Gordon Le Sueur gives the reader a clear, vigorous, and very readable sketch, with caustic sarcasm, of the remarkable results of German energy and persistency in obtaining colonial territories during the last twenty-five years. He goes far enough in the present war to tell how Germany has also lost most of them. The author was formerly private secretary to Cecil Rhodes, so that, as one might expect, his chapters on the African colonies of Germany are much fuller and better informed than those on the German settlements at Kiao-chau and in the Pacific. He condemns the lethargy and incompetence of English diplomacy in failing to check German colonial expansion in its infancy. He is equally severe on the failure of the Germans as real colonists: "Their methods of colonization have good points in matter of detail, routine work, etc.; but, if colonization be regarded as something more than the exploitation of a subject race and the passive holding of its territory, they must be written down a failure." He appears to have used almost exclusively only English sources of information, and naturally gives only a British point of view.

The "Bibliography and Index," which forms Volume XII of Sir J. G. Frazer's "The Golden Bough" (Macmillan; $6 net), completes the new and immensely enlarged edition of a book which has long ago taken its place as the most complete collection of facts relating to the beliefs, superstitions, and ceremonial usages of mankind in primitive and semi-civilized times. It consists, in this third edition, of seven parts, viz.: The Magic Art and the Evolution of Kings (two volumes), Tabu and the Perils of the Soul (one volume), The Dying God (one volume), Adonis, Attis, and Osiris (two volumes), Spirits of the Corn and Wild (two volumes), The Scapegoat (one volume), Balder the Beautiful, Fire Festivals, and the External Soul (two volumes). Each of the seven parts has its own index, but, as the subjects dealt with are closely related to one another, and often overlap in their treatment, a single index for the whole work was much needed, for without it a reader desiring information on some particular point might have to consult seven separate indices before finding what he looked for. In this present volume the Bibliography occupies 144 pages. It gives one a good idea of the great progress made in the study of these topics during the last half-century, and an idea, also, of the immense amount of labor which the production of this particular work required. And, of course, it constitutes a valuable guide to the literature, still rapidly growing, of the subject. The Index fills pages 147 to 536. To peruse it is to learn much about the wide range which inquiries into the early social and religious history of man have taken, and, incidentally, to realize how widely diffused over the world, and how clearly discernible, even to-day, in civilized countries are many of the customs practiced by our remote ancestors. Sir James Frazer is to be congratulated on the completion of one of the most remarkable works of our time. Great as it is, it does not exhaust the subject; and we hope for still further light from his pen upon some other topics, which are indicated, but not fully dealt with, in the eleven volumes with which he has enriched the literature of folklore and primitive religion.

Pretending to little originality of historical matter, John Finley's "The French in the Heart of America" (Scribner; $2.50 net) bears throughout the stamp of the author's individuality. The volume, which is made up of lectures delivered on the Hyde Foundation at the Sorbonne, avows as its object "to freshen and brighten for the French the memory of what some of them had seemingly wished to forget" (this was prior to the war), and the pulsating style is sufficient evidence of the author's sincerity of purpose, as of interest in what he has to relate. If Parkman has supplied the material for the older portion of the story, the writer's own eyes have looked upon the scenes of the events of which he tells, his well-known love of walking doubtless being not a little responsible for this familiarity. It is no derogation to the accuracy of the volume to say that its author is keenly conscious of the dramatic and the picturesque in the romantic and even tragic tale he has to unfold. What misleads him is his ardent admiration for the heroic figures of the drama and for the people whence they were sprung. Indeed, Professor Finley makes no pretensions to a sober, dispassionate view of the panorama. "I write," he says, "as a son of the Mississippi valley, as a geographical descendant of France." The result is naturally over-emphasis upon the part that France played in the New World, and ascription to her of more than can be substantiated. The volume is as much tribute as record. This fact does not make it the less interesting, and one cannot say that the author has not given the reader fair warning. The first half of the book follows events in chronological order; the rest of it is rather topical, as may be sufficiently illustrated by the title of one of the chapters, Western Towns and Cities that Have Sprung from French Portage Paths.

Of "Women the World Over" (Doran; $3 net), by Mrs. Alec-Tweedie (née Harley), F.R.G.S., an American edition has issued from the astounding fact that the British public has required a second printing. The passer who may find time to borrow the volume from a bookstall for five minutes will find upon any of its pages some gem of pretentious nonsense which will well reward that expenditure of time.

Passion is a whirlwind, ungovernable, wild, bursting with emotion, devoid of reason, and regretful of results.

A lonely walk through a beautiful glade or sun-kissed wood is an uplifting force. It fills our souls with delight and joy, and enthuses us with the multitudinous wonders of Nature and her mysterious whole.

Widowhood is the time of flirtation. One of the most useful assets of society is its charming army of widows. They do so much good, avert so much harm, just because men look upon them as comrades.

Or there are bursts of humor—we must not begin to quote them. One thinks with amazement of those thousands of people in stricken England who found money and temper for this book. Is the American publisher right in looking for the likes of them on this side of the water?

A second edition of a solid book on ancient Greece is a notable event nowadays, and notwithstanding that it contains in its new form only a map and four pages, mostly of footnotes, not found in the first edition, its reappearance after an interval of four years demands renewed recognition. The book thus specially favored by the approval of a select public is Alfred E. Zimmern's "Greek Commonwealth" (Oxford University Press, 1915). Its merits are sufficiently indicated by the fact that the first comparison that suggests itself is with Fustel de Coulanges's famous "Cité antique." It is not so comprehensive as the great Fustel's masterpiece, but that is in its favor; for, as Mr. Zimmern himself well remarks, prominent among the "defects which time has revealed" in "La Cité antique" are the facts that "it is, like many French books, too tidy and logical, it simplifies the old world and its beliefs too much; it tries to deal with Greece and Rome at the same time—an impossible design which survives from the days when people believed in a parent Aryan civilization; hence its generalizations sometimes fall between two stools and fit neither." The task which Mr. Zimmern sets himself is accordingly greater through being smaller. What he wishes to do is to make intelligible to modern cultivated Englishmen—and Americans—the imperial democracy of Athens. This is done in two ways. Its origin and the origin of all its component institutions are traced with firmness and precision, and we come to understand the democratic and imperial system of Athens by being shown how it came into existence. Then its nature and that of its parts are explained by modern comparisons widely and aptly drawn. The author holds up steadily politics, economics, and society, work and play in Periclean Athens, beside their parallels in modern England, and with unusual finesse of observation he proceeds to point out in fresh and vigorous language the points of difference and resemblance. The result is that Mr. Zimmern accomplishes more than he sets out to do. He interprets not only Athens but also England—and America. The study of ancient civilization yields in this book as in few others one of its most prized boons—a deeper comprehension of the age in which we live.

The author's style is inimitable. As Wilamowitz, to whom "above all and in spite of all" the author acknowledges his indebtedness, has remarked, the book is untranslatable. It belongs to England; *es ist ein vornehme englishes Buch*, the great Berlin philologist affirms. And that is not the least of its virtues. The past generation has been the German generation in the writing of Greek his-

tory. We have got so used to having the Athenians, with their disposition to let each citizen live as he pleased and their insistence that the Government was made for the people and not the people for the Government, criticised from the standpoint of a minutely regulated bureaucratic society that it is a real disenthralment to have them and their doings appraised by one who understands the strength as well as the weakness of a free people. It does not weaken the book intrinsically, while it adds to its interest and significance for American readers, that during its composition Mr. Zimmern has had an eye also for the characteristics of democracy in the United States. Mr. Zimmern's scholarship is sound and broad. His forte, however, is that much rarer thing—interpretation. He arrests our attention and stimulates our thought at every turn. One passage, taken almost at random, must suffice to convey a direct impression of the charm of his book:

It is hard to realize in these days, when fighting taxes the nerves and tires the limbs, but has lost most of its thrills and all its animal excitement, what a fine sport it was in the days when men regarded it as the great and only game. A Greek city, as we have said, was very like a big school or college, and warfare and the training and competitions connected with warfare were its chief forms of physical exercise. If a young man took a pride in his body and kept it hard and fit, if he flung spears in the stadium and raced round naked or in full armor, if he went off on long marches over rough country in the sun and bivouacked at night on the open hillside, or lay on a bed of rushes, watching the moon rise over the sea, after a hard day's rowing, it was all to prepare himself for the big day which might come any spring, if the city in council or the men over the range so willed it. So he and his friends lived in an atmosphere of campaigning. Their conversation ran on spears and shield-straps and camping-grounds, and where to get rations up in the hills, on rowlocks and catheads and undergirding and the boils and blisters of naval service; on how to ship horses in a trireme by cutting away the benches, or how to land on an enemy's promontory and make a fort without tools, carrying the mortar on the bent back for want of hods; or how to make a surprise attack on their chief harbor, sailing in with the night wind and making a bonfire of their bazaar to match the red of early dawn; or whether it would be fair and honorable and according to the best traditions of the old game to entrap them into a marsh or lay an ambush in a ravine or engage a corps of wild men from Thrace to eke out inferior numbers. Modern readers sometimes wonder why Thucydides and Xenophon deluge them with campaign tales; they are apt to resent or to smile at the childish particulars which these grave historians are at such pains to narrate. They should recall the conversations to which they have listened, or perhaps contributed, in smoking-rooms and quadrangles and pavilions, on yorkers and niblicks and ebenezers, on extra covers and wing three-quarters, and ask how much of it would be intelligible, however beautifully written out, to an inquiring posterity which had turned to other pastimes.

A timely, well-arranged, and attractively illustrated guidebook is Ruth Kedzie Wood's "The Tourist's Maritime Provinces" (Dodd, Mead). The author is something of a specialist in guidebooks, having prepared similar aids to the traveller in Russia, Spain, and California, and she has learned the art of combining the facts we look for in a guidebook with a very entertaining narrative. To those not familiar with the Maritime Provinces of Canada, it will be a revelation to find how many and how varied are the attractions that beckon the traveller to the land of the Bluenoses. From St. Andrews, on the boundary between New Brunswick and Maine, with its delightful sea views and its excellent golf links, to the Bras D'Or Lakes, in Cape Breton, of which we heard many years ago from Mr. Charles Dudley Warner; and from the Annapolis Valley, and the Land of Evangeline, to the Restigouche and the Metapedia, where tired statesmen and other mortals forget their worries in salmon-fishing, scores of delightful resting-places may be found, for men, women, and children. Miss Wood also gives some account of that picturesque little province, Prince Edward Island; also of the wild Gaspé shore of Quebec, of Newfoundland and Labrador, and of the French islands of Miquelon.

The recent appointment of Gen. S. B. Steele to the command of the Second Canadian Contingent lends special interest to his volume of reminiscences, "Forty Years in Canada. Reminiscences of the Great North-West, with Some Account of His Service in South Africa," which is edited by Mollie Glenn Niblett, with an Introduction by J. G. Colmer, and is published by Dodd, Mead & Co. It is difficult to realize that a man, still sufficiently in his prime to undertake the arduous duties of an important command in the European war, knew the Canadian West at a time when Blackfeet and Cree, Sioux and Assiniboine still followed the warpath, and when the buffalo roamed the plains in herds of a hundred thousand or more. Sam Steele, as he is affectionately known in Canada, served through the Riel Rebellion of 1869-70, and on the organization of the Northwest Mounted Police joined it as sergeant-major. This was in 1873. He remained with this splendid force for about a quarter of a century, and the greater part of his book is taken up with the story of the development and manifold activities of the police. It is by all odds the best history of the "Guardians of the Plains" that has yet been written, and is packed with incidents and anecdotes illustrating the pluck, endurance, and extraordinary influence of the force. Not the least interesting portion of the book is the two chapters dealing with the work of the Mounted Police in the Yukon, in the early days of the "gold rush." While it does not attempt to minimize the seamy side of the gold camps, Steele's account is much less lurid and extravagant than the picture drawn by Service in his "Trail of Ninety-Eight," and probably much more authoritative.

On the outbreak of the South African War, Steele was offered the command of Strathcona's Horse, the force equipped and maintained by the late High Commissioner of Canada in England. The corps was recruited entirely in Western Canada, and every detail of organization and equipment was supervised by the commanding officer. The credit for the splendid services performed by Strathcona's Horse in South Africa belongs at least as much to Steele as to Strathcona. An interesting incident of the recruiting was the offer from 600 first-class Arizona stockmen to join the regiment with their own horses and arms. Steele was reluctantly obliged to decline. "One could," he says, "have had the assistance of thousands of the finest horsemen in the United States." Shortly after his return to Canada, Steele was offered the command of a division of the newly organized South African Constabulary, and the final chapters of his book are devoted to a very interesting account of the work of this force, and the important part it played in the period of reconstruction in South Africa. Steele's own long experience with the Northwest Mounted Police was unquestionably an invaluable asset in the organization of the somewhat similar corps in the sister commonwealth. Altogether, "Forty Years in Canada" is a book that will appeal to any one interested in the story of an exceptionally varied, adventurous, and useful career.

Volume thirty-nine of the Reports of the American Bar Association deserves a place in every library, for it contains a large amount of information valuable to laymen as well as to lawyers. The efforts which were made during the preceding year to simplify and improve the methods of legal procedure, to bring about uniformity in the laws of the several States, and to make legal rules accord more nearly with the moral ideals of our people, are described in much detail. Especially interesting are the reports of committees on professional ethics, on laws to prevent delay and unnecessary cost in litigation, and on legislative drafting. The last-named report should be studied by all who are in any way responsible for the formulation of statutes. Not a few of the addresses, preserved in this volume, received marked attention upon their delivery last autumn, and can be read again with great profit. Senator Root's discussion of the layman's criticism of the lawyer is remarkably sane and satisfying. Sir Charles Fitzpatrick's sketch of the Constitution of Canada not only describes the fundamental laws of that Dominion, but explains the reason for Canadian loyalty to the British Empire. Another study in comparative politics is afforded by the lucid and eloquent address of Ambassador Naón on Argentine Constitutional Ideas.

Prof. Edward Alsworth Ross's "South of Panama" (Century; $2.40 net) just misses being one of several things. It is nearly a book of travel in South America, though as such it would have to be set down as meagre and routine. It seems in parts to aspire to be a treatise on South American races and their blending, though the generalizations are so sweeping, and so little documented, as to leave the reader questioning more often than convinced. Again, Professor Ross might be thought to be writing a critique of education in the republics to the south of us; and here he presents a considerable body of information, with many judicious remarks. In other pages, he could be supposed to have as his main object the giving an account of political conditions in South America; in these sections of the volume he lends a credulous ear to gossip of all sorts from many chance sources. And when one wonders how all this diverse and rather disconnected matter came to be put within one pair of covers, there remain the large number of illustrations—nearly a hundred—to serve as the possibly unifying element and motive of the volume. It is as if the text were but a *libretto* to go with the pictures, magazine-fashion. At all events, the net impression is of something hastily made to order. In the preface Professor Ross says that he was warned to bear in mind, when writing about the South Americans, that it is our "traditional policy" to "cultivate their friendship." But this counsel he spurns. He admits no obligation except to Truth. His book proves, however, that the Truth about the South Americans can be attained but imperfectly by the methods he has used.

Science

"TWILIGHT SLEEP."

Twilight Sleep. By Henry Smith Williams. New York: Harper & Bros. 75 cents.

The Truth About Twilight Sleep. By Hanna Rion (Mrs. Frank Ver Beck). New York: McBride, Nast & Co. $1.50.

Painless Childbirth. By Marguerite Tracy and Mary Boyd. New York: Frederick A. Stokes Co. $1.50.

Ruthless to women, and reckless of some of the common decencies of warfare, Germany is said to have shown herself in the present conflict. Certainly in the wards of her hospitals for women and in their operating rooms and dispensaries, England and America find a surprising disregard of decency and a lack of consideration of very ordinary human rights. Yet it is from this land that the promise comes of what may be for woman the third great tenderness, physically and in order of time. First, Scotland's chloroform abolished the worst pangs of childbirth. Then America led the way in the repair of its injuries, in special surgery and treatment—and still leads in conscience and craftsmanship. And now, in Germany, preëminent for organization and scientific studies, the third epoch opens with the offer of scopolamin to do for long labors what chloroform does for their sharp ending.

At the University of Freiburg, on the edge of the Black Forest, Professor Krönig and his associate, Professor Gauss, have studied, with Teutonic exactness, for several years, in some 5,000 births, to relieve those pains for which chloroform cannot be used without arresting progress—that is, early, and in long labors—by bringing about a profound drowsiness through scopolamin. This drug is one of the well-known belladonna-atropia-hyoscin group, but Freiburg has worked out a trusty and stable form of it. Morphine, dangerous to the child's breathing if used within three or four hours of delivery, helps the first dose. Then, under the most painstaking expert supervision, the mother is watched and the child's heart listened to every quarter of an hour, hour after hour, through the average half or three-quarter day of labor. Careful memory tests determine the times for repetition of the dosage. The room is darkened because of the sensitive wide-open pupils, the ears are stopped, and relatives kept away. These precautions are taken so as to eliminate as far as possible all disturbing sense impressions. The face flushes, the mouth and lips are parched, the patient is sometimes incoherent. Complaint or bitter outcry there may be, but, when successful, all memory of major suffering is wiped away. Very special surroundings and quantity and quality of service are demanded by this technique. As a result, reports from Freiburg assert a mortality lower than anywhere else and no harm to mother or child, coupled with freedom from exhaustion and shock. As a separate matter, this clinic has adopted the practice of getting the patients up quickly after labor and having them leave the hospital soon: a walk every day and a drive at the end of the week for most patients, since, as a direct consequence of lessened suffering, a shortened convalescence is generally observed.

Though known to the medical profession for a long time, "twilight sleep" was thrown open to public discussion by an article in a monthly magazine. The books that have followed challenge attention from the public and the profession. In the largest of these volumes, the two associated lay writers have shown true journalistic energy in expanding the article in *McClure's* to 316 pages containing surprisingly few technical errors—though many repetitions. The more important medical papers on the subject are either quoted at length or else given in full in the appendix. The work, therefore, is of much value in supplying original sources. Indeed, the book is a special plea in nearly every sense, and it is a pity that with so strong a case the authors should deem it necessary to overstate it at many points. To the journalist it has seemed desirable to furnish to the public "human interest" by setting forth the portraits and colloquial talks of American mothers of Freiburg babies. The obstetrician, however, welcomes all the light he can get. To him it seems a mistake and a needless alarm to young women to throw the subject out of perspective. One might infer that all labors culminate in "domestic shambles"; childbirth is soul-rack as "dreaded as death"; "women of good normal minds" become "brooding animals"; while "nervous breakdown," dreaming of coffins, "aversions for husband and children," and the "madness that follows" are average sequelæ. These are samples drawn from three successive pages. There is enough keen suffering without depicting an unbroken reign of terror; there may be doctors who are heartless, and some family physicians do stint chloroform from over-caution, but to say that through two generations painless childbirth, possible through chloroform, has been withheld from women is in direct contradiction to the nearly universal practice of anæsthesia in delivery. The book fails to give a hint of the great number of quick labors in which even Freiburg would not give twilight sleep, of the very moderate suffering in many, of a striking difference in length and difficulty between the first and subsequent deliveries, and of the conditions in which the Freiburg doctors do not deem Dämmerschlaf safe; nor is due credit given for the wide ground already well covered by morphine and the older anæsthesia as well as by the newer nitrous oxide methods.

Professional caution in America is belabored by our authors, and the former unwillingness to give serious trial to the method is truly ascribed to the fierce onslaught made by Berlin specialists on the earlier publications, and the unreliability of the earlier drug. The fact is, American obstetricians are working out the indications and limitations as applied to American patients. They have seen exploitation by the press of the turtle serum cure for consumption of Friedmann, and the hip joint hysteria of Lorenz, and many other journalistic crazes. They do move warily in matters so weighty. Krönig and Gauss have themselves deprecated popular ventilation of their methods. In the present instance, however, it may well have been a public service for the press to force a quick and widespread study of the procedure in use at Freiburg.

A false measure of promise is contained in the book's label, "*Painless* Childbirth." In the originators' own hands the medicines are not started until labor is definitely under way; they are slow to develop their full action, and failures of relative painlessness occur in twenty per cent. under ideal conditions, in private rooms, and in forty per cent. in the specially planned delivery rooms of the free wards. Nevertheless, the boon of even partial relief can hardly be estimated too highly.

Some of the strongest medical and surgical work is done at the smaller German universities. The present reviewer has twice visited the Freiburg clinic, one of the best in Europe; has been under the spell of the power and personal charm of big Professor Krönig—with his energy as of Oyster Bay and his sweeping generalizations—and greatly admires the untiring thoroughness of Professor Gauss, and he believes the bulk of their statistics. But that it is well to check up their results may be inferred from such items as the hiding of an unpromising case from a group of professional visitors, the trouble in controlling the delirium of another, and their blanket endorsement of X-ray and radium versus the knife, in certain tumors—traits which show a very human tendency to ride their enthusiasms hard.

The book by Hanna Rion gives the German controversy over Dämmerschlaf fully, and quotes British opinion at length. This lady also has labored much on the older literature. There is scant reference to the more recent. To her there is but one possibility—perfectness, completeness, and never a drawback or danger. She makes sweeping assertions for Gauss that Gauss himself is careful to disclaim. She cannot see a contradiction in these sentences: "You see the most remarkable quality of this narcotic is that the mother is in possession of her mental faculties, that she can obey the nurse's requests—can, in fact, coöperate with the entire birth process"; and, quoting a patient, "I had a perfect wrestling-match with the head nurse." She gives the lie to the evidence of cases seen at the Freiburg clinic by the author of one of the ablest and most recent of American textbooks, yet begins and ends her volume with the words of an obscure man of scant experience for whom "the ordeal of motherhood is gone, to be seen no more." The naïveté of her enthusiasm ("every woman physician whom I've ever met has been altogether adorable")

is curiously mixed with learned tables of percentages bearing on the last refinement of technicality.

Although so short a book, giving hardly more than a good outline of the subject which is its title, Dr. Williams's little volume contains a valuable study of the present status of obstetrical practice and a really constructive plan for its betterment.

Owing to the low standards of training and remuneration of the man who has taken up the practice of obstetrics, the writer finds lamentably and inexcusably imperfect work in many of our hospitals and teaching institutions. In his arraignment of conditions in this country he divides the burden of blame. It is not to be laid wholly on the shoulders of the profession, but is to be partly borne by the ignorance and long suffering of the general public. Nor is his criticism the kind that condemns and discourages. Quoting Dr. Whitridge Williams, Dean of Johns Hopkins Medical School, he presents most clearly suggestions for the improvement of obstetrical teaching and practice, making the doctors, the schools, and the public each take a share of the responsibility of bringing about a better state of affairs.

To the question, What can the layman do? he answers that "there should be an extension of obstetric charities, free hospital, and out-patient services for the poor, and proper semi-charity hospital accommodations for those in moderate circumstances"—Freiburg being an example of the success of institutional care. He deems that the repugnance to hospitals in obstetrical cases is gradually disappearing, and that an ideal of a properly equipped institution, practically available for all such cases, is by no means an impossibility and can be planned broadly enough to include conditions in small towns, and even the demands of farming communities.

Specialties as they develop become more intricate. Refinements of method make new demands. Finished workmanship calls inevitably for more time to be devoted both to training and to the individual case. And more training and more service mean an increase in cost to hospitals, a larger fee for the private patient. No more striking example of these can be given than twilight sleep. Admitting the necessary limitations of the applicability of this treatment, those who can be cared for under it are: First, women who are willing to enter a hospital equipped with adequate service. These can be properly treated whether they be rich or poor, provided the institution will stand the expense of extra internes and nurses. Secondly, the well-to-do in private houses who will pay for special attendance. Such attendance involves one of four things: presence of the obstetrician throughout the labor, which would be very costly on account of the amount of time he would be obliged to give up to it; assistance by a younger obstetrician who could stay with the patient; the anæsthesia to be conducted by an anæsthetist devoting himself to this specialty, or by a nurse fully trained for the work.

As intelligent patients now know that the dentist cannot fill the root of a tooth or do work properly without the X-ray; as the public begins to learn that the practitioner cannot treat an active or chronic rheumatism without study of the tonsils and X-rays of the tooth-root; as they demand that an expert and not an amateur give the ether at operations, so the time is coming when the woman will ask, for her delivery, conditions of quietness and special skill, or else she will not be receiving reasonable care in the most important event of her life.

Drama

"THE BLUE PARADISE."

This adaptation of a Viennese operetta, which the Shuberts produced last week at the Casino Theatre, is a good deal above the average of musical comedy, whether of the variety expressly provided for the delectation of summer audiences or of the more potentially stable kind which aspires to entertain the inane throughout a regular season. Wholly innocent of genius, on the part of composers, librettists, or players, "The Blue Paradise" is nevertheless unusual, even audacious, in that it tells a story and sticks to it, without the introduction of irrelevant matter, throughout a prologue and two acts. Even the musical numbers, some of which are exceedingly tuneful, if at time frankly imitative, bear at least a modicum of relation to the story and are introduced without resort to the usual clumsy devices. The spotlight and the simpering star beneath are notably absent, the principals conveying the healthy impression that they are genuinely interested in the success of the production as a whole. The chorus is not above reproach, but it is better trained and rehearsed than the majority of Broadway choruses. The staging is excellent without being pretentious, and the same may be said of the costuming. Of the principals, Teddy Webb, as Justus Hampel, gives the most finished performance; the most popular is that of Cecil Lean, whose hard work and evident—and, it must be added, successful—efforts to please atone for a certain irritating quality of self-complacency. A clever burlesque, which, if it were seen in London, would doubtless be denounced as a gross exaggeration of an American type, is given by Miss Carolyn Burke. Miss Frances Demarest and Miss Vivienne Segal are two other principals who contribute to make an ensemble that is decidedly good of its kind and affords a pleasant entertainment.

S. W.

If the three one-act plays in the volume of "Wisconsin Plays," by Zona Gale, T. H. Dickinson, and W. E. Leonard (Huebsch: $1.25) are a fair specimen of the product of the Wisconsin Dramatic Society, that organization is setting a good example and deserves recognition and encouragement. They are not, in any sense, masterpieces, but they are thoroughly good of their kind. As devoid of plot as they are of sensation, they contain vital characterization and breathe the spirit of their environment. Perhaps the best of them is the "Neighbors," of Zona Gale, which is a rural comedy, simple, real, and free from buffoonery or melodramatic extravagance. The story is tenuous, but the charm lies in the complete veracity with which each character is sketched, and in the realism of the dialogue, tinged with gently satiric humor. Very different is the "In Hospital" of Thomas H. Dickinson, of which the motive is emotional. It provides a situation of strong dramatic tension without appeal to crudely startling detail. A loving husband, haggard with apprehension, visits the hospital where his wife is about to undergo a critical operation. In the ensuing colloquy each of the principals is anxious to ease the anxiety of the other. The dialogue, with its veiled references, is simply, naturally, but very tenderly written. Realism is alleviated by fancy. On the whole, this is a striking one-act play—marred perhaps by a conclusion that savors too strongly of the purely theatrical—but the chief worth of it is to be found in the human insight of the conjugal conference, where the underlying sentiment is deep and true. In "Glory of the Morning," an Indian pioneer romance, by William Ellery Leonard, the distinctive merit is the approximation to success in the attempt to reproduce the atmosphere of frontier life in the days of the French voyageurs. The personages are too closely modelled upon convention and the idealizations of Longfellow and Cooper, not to mention Mayne Reid, but in the setting of the story the picturesque and spacious spirit of the woodland is admirably preserved. It is a little tragedy of miscegenation, is prettily and pathetically told, enforcing an obvious moral without in the least obtruding it. The production of three such plays—so fresh in conception and superior in execution—by an independent organization, whose professed object is "to provide for the section in which it exists a new impulse in the practice of dramatic art as a corrective of standards," is a hopeful omen for the future of a representative American stage, and is worthy of note.

There is much intelligent and candid criticism in P. V. Thomas's review of "The Plays of Eugène Brieux" (John W. Luce & Co.), and the otherwise uninstructed reader may get a clear and comprehensive idea of the nature and extent of the work of the French playwright by a study of this handy little volume. The author has supplemented and enforced his own opinions by pertinent quotations from various respected contemporaneous authorities and by specimen extracts from the plays themselves, which would, perhaps, have been more illuminative if left untranslated. He has no difficulty, of course, in furnishing abundant testimony to the great abilities and sincere philosophic purpose of M. Brieux, or the reality and menace of the social evils he assails. On all these points there is general agreement. The main questions upon which his critics and his admirers are at issue are whether all his topics can be profitably discussed before the miscellaneous audiences of the public theatre, and whether, in dealing with them, he has manifested a dramatic genius of sufficient literary and artistic value to outweigh all objections on the score of expediency. They cannot be argued briefly. Mr. Thomas, apparently, would be inclined to answer them both in the affirmative, although he acknowledges frankly enough the obvious defects of M. Brieux as a dramatist, including his inveterate tendency to lecture. He seems to hold that the importance of the motive and the validity

of the argument compensate for halting action and the lack of dramatic interest. This will not meet with general acceptance, any more than will the high valuation which he puts upon "La Robe Rouge" as a dramatic masterpiece. This arraignment of the French criminal judicial system is, undoubtedly, an ingenious and able work, full of strong scenes and vivid characterization, but it is too manifestly a bit of special pleading, too full of artifice and exaggeration to provoke unqualified admiration. At the most, it is effective melodrama. And in nearly all his plays, whether he is attacking modern education, politics, charitable abuses, or medical practice, M. Brieux, like most enthusiasts of his type, discredits a good cause by offering particular instances, specially invented to enforce his plea, as proof positive of general conditions. To say that this weakness is virtually inevitable in writing for the theatre is simply to question the efficacy of the sociological play. He is most effective, because nearer to the truth, in his more humorous pieces, such as "Les Trois Filles de M. Dupont" and "Les Hannetons," which are, perhaps, his most notable dramatic achievements up to the present time. But his ability, sincerity, and mastery of social details are qualifications which give him an assured distinction among modern theatrical writers, and this little book, on the whole, deals with him very fairly.

Finance

PROVIDING THE IMPETUS.

The high carnival in war-order stocks has gone forward. Though the pace has not been so spectacular as in the closing days of July, it continues to occupy the centre of the Wall Street stage. The public evinces but passing interest in the railway shares, preferring the "action" of the highly speculative issues to the quiet firmness of the dividend stocks. The consequence is that the craze for the war shares has lifted prices, and under the influence of the heaviest buying witnessed since the present rise in these stocks began, absolute high records in the history of the New York Stock Exchange have been fixed.

It is being said by every conservative person that the movement has become dangerous. Yet there is no telling how far it will go, for the public is in the frame of mind to believe any sensational rumor that those inside put out. In such a situation no one can foretell what any day will bring forth or what fresh complications will be encountered. Sooner or later the reckoning is bound to come, for the movement is already unwieldy, and the stocks in many cases are passing into the hands of weak holders. The banks have rendered a service to the community in requiring an excessive margin on loans secured by collateral, in which the inflated shares are prominent. At a time when the speculative public, having the bit in its teeth, rejects the warnings of those familiar with the pitfalls of speculation conducted at an extravagant level of prices, it is necessary to adopt unusual safeguards. The situation is interesting, as such situations always are, and the movement has reached a stage where the authorities of the Stock Exchange, the banks, and the responsible leaders are doing their utmost to interpret conditions in their true light.

At times it has appeared as if speculators themselves recognized the need for checking the speed of the rise, and quite unexpectedly a quality of caution has made itself manifest on a number of occasions in those stocks which had been the leaders in the market's wild advance. Just how Wall Street would judge the meaning of a decided check in the stock-market excitement at this time is difficult to say. One thing the recent moderate checks were acknowledged to mean, beyond dispute; it was that the proportion of out-and-out gambling which in the last half of July went on in the munition issues had diminished.

In just the degree to which this continues true must the future course of the stock market be shaped. For now it is clearly recognized that investment purchases have had little to do with the movement under way. Investments are made in securities whose merits are known and whose future is not a closed book. Speculative and gambling purchases have lifted munition stocks to their present altitude. If the advance is to continue, either speculation or gambling must lift them—that is, unless manufacturers of munitions choose suddenly to make known publicly the war orders, earnings, and profits they have thus far kept absolutely secret.

Which will the larger impulse be? Some people will frown over this question and rejoin, Just what is the distinction between speculation and gambling, that the immediate future of the stock market should rest upon that? Others will say that, if the market is to rise further still, either or both will supply the impulse, since speculation and gambling are one and the same thing. These people accept the ideas of J. Shield Nicholson, professor of political economy in the University of Edinburgh, who wrote twenty-five years ago that speculation was anything from "reckless, ignorant gambling to farseeing calculations of the course of progress in all departments."

But there is a distinction, and with either speculation or gambling will rest from this time forward the larger responsibility for the fate of the boom in the war stocks.

Speculation and gambling alike have for their primary force the endeavor to penetrate the riddle of the future, with this difference: the speculator calculates, the gambler chances. The speculator assumes a risk and often loses, but that is because the x quantity of his problem at times turns out to be other than he thought it was. For the gambler there is no problem, no calculation. In betting on horses, *chemin de fer*, roulette, and *trente-et-quarante*, as well as blind plunging on the stock market, chance and fortune govern for him.

Up to this time there has been speculation in war-order stocks on a large scale. But what up to this time was speculation has gone nearly as far as it can go without crossing the line that separates it from gambling. Why? For the reason that the "problems" which confronted speculators in the war stocks have been discounted in advances which, since the war began, have ranged from 30 to nearly 300 points. War contracts and output of mills have supplied the "problems," of which profits were the x, the unknown quantity.

Answer to all the problems has been delayed, through refusal of manufacturers to make known their profits. But the answer has been discounted, nevertheless, so thoroughly that stocks which never paid dividends are selling at prices far above those attained by the highest-grade investment issues. By lifting them there, speculation has done as much as could be expected of it, if not a great deal more. To lift them further, unless brand-new problems are presented for speculators to calculate, outright gambling must supply the impetus.

Just Out

Young and Schwartz's Elementary Geometry

By J. W. YOUNG, Professor of Mathematics in Dartmouth College, and A. J. SCHWARTZ, William McKinley High School, St. Louis. (*American Mathematical Series.*) x + 218 pp. 12mo. $1.00.

The authors of this book believe that it is a pedagogical mistake to begin geometry in the conventional way with formal demonstrations. The first chapter, therefore, gives an informal treatment of the elementary constructions with a large number of applied problems in geometric drawing. The pupil thus gains a fair appreciation of a geometric proof and much drill in simple demonstrations. Formal statements of proofs do not occur until Chapter III.

John Shaw Billings
A Memoir
By
Fielding H. Garrison, M.D.
8°. $2.50
440 pages. 7 illustrations

John Shaw Billings is primarily associated by the New York public with the direction and upbuilding of the N. Y. Public Library during the first seventeen years of its existence. Another great claim upon public gratitude is found in his letters and note-books giving his experiences as a medical officer during the Civil War. After the close of the war, Dr. Billings's career was one of most extraordinary activity and accomplishment.

The Nation

NEW YORK, THURSDAY, AUGUST 19, 1915.

Summary of the News

The text of the American reply to the Austrian note of June 29, in which the United States was requested to place an embargo on the export of arms to the Allies, was published in the morning papers of Monday. The note, which was dated August 12 and was dispatched to Vienna on the following day, contains the strongest possible reaffirmation of the American position on the question of the right of a neutral country to sell arms to any belligerent, citing in support of this right the former practice of Germany and Austria, especially during the South African war.

The reply to the last German note on the case of the William P. Frye was presented to the Foreign Office in Berlin on August 13. The text of this note was published on Tuesday. The German proposals for payment of compensation are accepted; and it is agreed that the disputed treaty provisions be submitted for arbitration at The Hague, but Germany is asked meanwhile for a statement as to whether she intends to conduct her future naval operations in accordance with her interpretation of the Prussian-American treaty or that of the United States.

With the concentration of Austro-German forces on the Servian frontier and the renewal of the bombardment of Belgrade late last week, it is generally considered that the crisis of the situation is near at hand. Both the Greek and the Servian Parliaments met on Monday, and it is expected that in the course of their debates a determination on a definite line of action will be reached. In Greece, the Ministry of M. Gounaris, defeated on Monday in the election of a President of the Chamber, resigned, and the resignation was accepted by the King on Tuesday, when M. Venizelos was called into conference. In general, the situation has remained as we described it last week, its issue depending on the concessions of territory which Greece and Servia are prepared to make to Bulgaria. Rumania last week removed the prohibitions against the export of grain, beans, lentils and peas, and petroleum, but has shown no signs of yielding to the German demands for the transport of munitions for Turkey through Rumanian territory.

According to the current issue of the *Army and Navy Journal*, which professes to speak on high authority, the German submarine "blockade" has been more costly to those who are carrying it on than has been generally supposed. "Nearly fifty German submarines," says the *Army and Navy Journal*, "have been sunk, captured, or destroyed by the Allies up to the 20th of July." This is a higher estimate of the loss than has generally been calculated, but it does not appear extravagant when one considers the frequent accidents that overtake these frail craft even during manœuvres. During the week since we wrote last the Germans have rather improved their average, having sunk eleven trawlers and ten other merchant vessels. Of the latter, six were British, four Norwegian, one French, and one Russian. In addition, a British steamer was torpedoed and run aground. On Tuesday news came that the British transport Royal Edward was torpedoed in the Ægean last Saturday with a loss of some 1,000 lives.

The New York *World* has undertaken the publication of a series of articles, supported by documentary evidence, exposing some of the origins and extent of the German propaganda in this country. As we point out in our editorial columns, the principal impression one receives from a perusal of this curious narrative is of the almost incredible blundering and stupidity which have characterized the conduct of the German propaganda, whether on the part of personages high in the estimation of the German Government or on that of so insignificant an individual as George Sylvester Viereck.

The German Embassy in Washington gave out for publication in Monday morning's papers a memorandum on the alleged misuse of neutral markings by British merchantmen, citing sixty-two cases in which British ships had endeavored to disguise their nationality.

A digest of a new Red Book issued by the Austrian Government was published in the papers of August 11. The present document sets forth in greater detail than the first the correspondence that passed between the Austrian and Italian Governments in the period from July 20, 1914, to May 23, 1915.

Official returns of foreign business of the United States for the fiscal year ended June 30 show that imports fell off during the year $219,755,917, while exports increased by $386,494,440. The trade balance in favor of the United States was $1,042,008,725.

An interesting statement was made by Sir George Buchanan, British Ambassador to Petrograd, in an interview cabled to the London *Daily Mail*, and thence to the New York *Times* on Monday. The Ambassador made the disclosure with regard to the much-discussed first attack on the Dardanelles that when Turkey declared war Russia appealed to Great Britain to make a demonstration in some quarter which would have the effect of drawing off a portion of the Turkish troops in the Caucasus.

A large shipment of gold and securities from the Bank of England to J. P. Morgan & Co. arrived in New York on August 11. The total value of the gold was nearly $20,000,000, and the securities were said to be worth some $30,000,000. The shipment has not served to check the downward movement of sterling exchange, which on Tuesday was at $4.64½, a decline of eleven points since the same day the preceding week.

A Parliamentary cabal, which has apparently been going on for some time against the French Ministry, and in particular against M. Millerand, Minister of War, and General Joffre, appears in the last few days to have been killed by healthy publicity. The French Government, according to dispatches from Paris on Monday, has announced that it will welcome open debate of the matter, and it seems obvious that the Government has the overwhelming support of public opinion.

The text of the note, bearing date of August 11, addressed by Secretary Lansing and representatives of six Latin-American republics to leaders of various Mexican factions, was published in Sunday's papers. Comment on the substance of the note will be found elsewhere. General Carranza, though he is understood to be willing to facilitate the dispatch of the note to the various leaders, apparently remains obdurate, reiterating his contention that he has the situation in hand and continuing to clamor for recognition.

On August 12 the Interstate Commerce Commission rendered a decision reducing the rates on anthracite coal from the producing districts in the Wyoming, Lehigh, and Schuylkill regions of Pennsylvania to tidewater and to certain interior points from five to eighty cents per ton.

Six indictments charging manslaughter and criminal carelessness were returned in the Criminal Court in Chicago on August 11 in connection with the disaster to the steamship Eastland. Those indicted were four officers of the company that owns the Eastland and the captain and engineer of the ship.

As a result of the recent inquiry in regard to unfair practices in examinations at Annapolis, it was officially announced on Monday that President Wilson had ordered two midshipmen dismissed from the Naval Academy, that others were to be disciplined, and that radical changes had been recommended in the method of conducting examinations.

The climax of the Frank drama in Georgia was reached on Monday night, when Frank was kidnapped from the State Prison Farm at Milledgeville by a band of armed ruffians. The warden and prison guards were apparently overpowered and Frank was carried off in an automobile. He was taken to Marietta and was there lynched.

The Haytian National Assembly on August 12 elected General Dartiguenave President of the Republic. The new President, it is understood, will not be recognized by the Government of the United States until he has given some evidence of his ability to guarantee the maintenance of peace, the security of life and property, and the adjustment of outstanding foreign indebtedness. Meanwhile, on account of disturbed conditions due to the factions of Bobo and Zamor, the United States is exercising military control at Cape Haytien as well as at Port-au-Prince.

Dispatches from Peking on Tuesday contained a curious story, which is not to be accepted without considerably more confirmation than it has at present received, that President Yuan Shih-Kai contemplates proclaiming himself Emperor of China and that his design is supported by the advice of Professor Goodnow, of Johns Hopkins University, legal adviser to the Chinese Government.

The Week

Surprise, with a tinge of ridicule, has been expressed at the exceedingly mild-mannered Pan-American note to Mexico. Something in the 'Ercles vein was apparently expected by many. But they should, in the first place, remember Mexican pride and sensitiveness, which had to be politely considered, and, next, should not overlook the substance as distinguished from the form of the note. It is signed "severally and independently," yet in the sentiments uttered the countries represented agree "unanimously." This at once assures the desired impression of Pan-American solidarity. By it the Mexican leaders and the Mexican people cannot but be influenced. And they will not fail to observe that the note ends with the statement that an answer will be looked for within ten days. This is not an ultimatum, of course, but it is the sort of time-limit that appears in ultimatums. What remains behind, the note does not say—and wisely. That is better left to the Mexican imagination. For the present, it is enough that a clear and friendly appeal has unitedly been made to the Mexicans to leave off their desolating and aimless fighting, and that the distinct intimation has been given that indefinite delay or shilly-shallying will not be tolerated.

As a matter of fact, the news from Mexico gives more encouragement to the hope of a peaceful settlement than for some time past. The mass of the people seem thoroughly sick of the senseless war, and eager for its cessation. We read of several Mexican States declaring officially that they have now done with the conflict. And the military operations themselves appear to be drawing to a close. It may not yet be true that Villa's power is hopelessly broken, but it is evident that his partisans are despairing of his success, and are daily abandoning him, while he himself has suddenly become most sweetly reasonable in his desires for peace. As for Carranza, it must be plain to him, or to his agent at Washington, that he got an absurdly false idea of what the Pan-American note was to be, and exploded his preliminary wrath quite needlessly. If he will now get off his high horse and show himself ready to act upon any reasonable suggestions for compromise and peace, a better day for Mexico may come earlier than any of us had thought possible.

The restoration of Mr. W. W. Russell to his post as Minister to Santo Domingo indicates, we trust, a change of heart in the President. He consented to Mr. Bryan's degradation of the diplomatic service probably for the sake of peace, and in accordance with his theory that Cabinet officers should have complete authority in their departments. It is even reported that Mr. Bryan assured the President that there were special reasons why a man so preëminently fit as Mr. Sullivan to handle the delicate Santo Domingo situation should replace Mr. Russell—Mr. Sullivan's fitness being doubtless his experience as counsel for "Jack" Rose. Whether this is correct or not, that gross blunder of Mr. Bryan brought its own punishment. Now, what the Administration should do is to avoid further scandal by rapidly removing other Bryan misfits and replacing them with men of Mr. Russell's experience in diplomacy. Everything in Mr. Lansing's career points to his sympathy with a policy of this kind. He is not a politician, but one versed in diplomacy, who understands the need for skill and training in this field. Indeed, he is the last man to wish to find places for the "boys," as Mr. Bryan asked Minister Sullivan to do in Santo Domingo. Surely, Mr. Wilson owes it to his future standing in history to rehabilitate the service as quickly as possible.

There is no need to put words to the rack in order to seek to express the full horror and shame of the lynching of Leo Frank in Georgia. Everything conspires to fix public attention upon this latest and culminating murder by the mob. The crime was committed, as it were, in full sight of the nation. The victim, whether innocent or guilty of the act with which he was originally charged, had come to be a public figure of tragedy. His trial; the long legal fight to save his life; the exhausting, by his friends and counsel, of every judicial recourse; the final commutation of his sentence; the murderous assault upon him in prison, his surviving which seemed almost a miracle; and now this fiendish taking off—surely, nothing more is needed to fasten the gaze of a whole people upon this supreme exhibition of the spirit of lawlessness. Cries and epithets avail nothing. The awful spectacle speaks for itself. We can only turn away from it with a shudder to ask what it all means and what can be done about it.

We fear that the Georgia authorities cannot be acquitted of negligence. For this lynching was visibly preparing. It was foreshadowed by outcry in a portion of the press. Throughout many parts of the State there was a bitter and mounting agitation against the former Governor, Mr. Slaton, for commuting Frank's sentence to life-imprisonment. This had been done in due process of law, and in full accordance with the established criminal procedure of Georgia; but thousands were asserting that it ought not to be submitted to. Ex-Gov. Brown most unwisely kept up the clamor. Tom Watson was reported to be eagerly making a political issue of the affair. Reputable newspapers, like the Augusta *Chronicle*, protested against further discussion of the case, but the mutterings and the threats were all the time rising in volume. That the State officials should have been warned by this, and have taken steps to protect the prisoner, seems to us clear. But reproaches on that score are idle. If the Government of Georgia, however, does not wish to be openly disgraced, and made a shame and a hissing before the whole world, it will exert all its energy and employ every resource of criminal prosecution, to run down and punish condignly the murderers of Leo Frank.

Superintendent Fullam, of the Naval Academy, does well to be angry over the result of the investigation into the charges of cheating at examinations. He is not the first Superintendent at Annapolis whose recommendations regarding disciplinary measures have been overruled at Washington, nor are there any signs that he will be the last. His seven midshipmen, marked for punishment, have been reduced to two, in accordance with the usual inclination to mercy in the office of the Secretary of the Navy, where Congressmen have a power of persuasion that they lack in the headquarters of the Superintendent. Admiral Fullam's reported remark that he would rather go to sea in command of a collier than remain at the head of the Academy if his action was not upheld, does him honor. It also explains the reluctance with which officers are apt to accept the post of Superintendent. One can have no heart in trying to bring or hold the institution up to proper standards of discipline when one is aware that a midshipman's appeal to Uncle So-and-So or to a friend of mamma's will cause activity at both the Capitol and the Navy Department which one is powerless to counteract, since to oppose "influence" one has nothing stronger than the mere merits of the case.

The sinking of a British transport in the Ægean is the swift German reply to recent

assertions that the submarine menace there had disappeared, and is a reprisal for the sinking of various Turkish transports. It brings out in clearest light the extraordinary work done by the British navy in protecting the transports which by the hundred, from the beginning of the war, have plied back and forth across the Channel. Whatever the precautions the British navy has taken, the fact is that the Germans have been unable to use their submarine weapon upon this vital line of supply of the British army. Poor little steam trawlers they can sink by the dozen—ignoble game that they are, and having no serious relation to the food supply of Great Britain. But for all the threatening of von Tirpitz, they have not bagged a single provision ship in the Channel, much less a transport. It is a fact upon which, curiously enough, Capt. Persius and the other Berlin naval experts cannot find space to comment.

The playwright would have his fortune made who could put into his third act even a fraction of the suspense with which the world hangs to-day upon the razor-edge situation in the Balkans. Yet the one fact that has so far emerged above the swirling tide of rumor and conjecture and fear brings hope to the Allies. The Greek Cabinet has fallen; the return of Venizelos to power seems assured. From German quarters we are told that it is a chastened Venizelos who will resume the reins of government, that the lesson of the German victories in Poland has been learned in the Balkans. But up to the last moment German opinion was equally certain of Italy's neutrality, and Italy actually entered the war when the dimensions of the Russian disaster were pretty well recognized. In favor of the Allies is the very change of the situation in Russia. The Allies are ready to give more than they were prepared to offer four months ago, and the Balkan states have less cause to fear that Russia will be the chief gainer by whatever success they can bring to the cause of the Allies. If they enter the war, and the Allies win, the Balkans will have won their own battle, and the fruits of victory will not be taken from them.

An Austro-German attack upon Servia, of which the bombardment of Belgrade may be the preliminary, would be for the purpose of subjugating the Servian kingdom, and not, as is frequently stated, for the purpose of getting through an army to the aid of the Turks on Gallipoli. Even if Servia is overrun, the Austro-Germans cannot reach Constantinople without crossing Bulgarian soil. In other words, Bulgaria would have to grant free passage to the Teutonic troops. Under the German conception, this would be no violation of neutrality, since it is what Belgium was asked to do at the beginning of the war. Conceivably, the Bulgarians might take a different view from the Belgians and stand aside for the Teutonic armies; it is conceivable, but highly improbable. At any rate, the Allies would naturally accept such action by Bulgaria as tanamount to hostilities. It is a question, therefore, whether the Kaiser is prepared to expose the Balkan nations to the test. The probabilities, it seems, are that, in case a Servian campaign develops and it proves successful for the Teutonic armies, these will be content with the actual results of the conquest and the great moral effect on the other Balkan nations. For if these nations have no alternative to entering the war, it is not yet imaginable to find them arrayed on the side of Austria, with its ambitions in the Ægean, and of their hereditary enemy, the Turks.

Dissensions in the ranks of the German Socialists seem to have culminated in an actual party secession. That Liebknecht should be among the signers of the recent manifesto protesting against further support of a Government apparently bent upon plans of conquest, is natural enough. But he has with him Eduard Bernstein, for many years the chief representative of the Revisionist or moderate tendency in the party. Still more striking is the adhesion of Haase, who was Parliamentary spokesman for the party at the outbreak of the conflict and in the voting of the two war loans. On those occasions Haase justified his action on the ground that the war was one of defence. To-day he maintains that it is plainly resolving itself into one of conquest. Liebknecht, Bernstein, and Haase now advocate a refusal to vote any more war credits. As a natural result, the patriotic Socialists have swerved to the other extreme, and announced their support of the Government in terms that foreshadow almost the abandonment of Socialist principles. The movement is probably regarded at Berlin with mixed feelings It is inconvenient to have a strong faction clamoring for peace and trying to force the hand of the Government. On the other hand, the prospect of a permanent cleft among the Socialists must be welcomed as a guarantee that the aftermath of the war will not see the Socialist uprising which has been predicted in some quarters. A party torn in two is hardly in a position to threaten the security of the established order. As it is, the reported intention of Liebknecht to question the Government as to its attitude towards conquest and peace is evidence that the party issue is to be forced at once.

We may take it that the new "King of independent Poland" within the Hapsburg monarchy will be some time in coming. His title at present seems to be derived from the war correspondents. This appears to be the regular aftermath of victory. Last autumn the defeat of the Austrians around Lemberg was followed by very much the same "separate peace" talk as we have now, and when the Austro-Germans in September moved against Warsaw and Ivangorod, they were supposed to carry with them an Austrian archduke ready to enter Warsaw as King of Poland. It is certain that Berlin and Vienna will wait for a fairly definite assurance of general victory before they make the dramatic venture. Aside from the question of victory, the erection of a new Slav kingdom under the Hapsburgs is not a matter to be decided in a day, or to be put through without very definite effects on conditions in the Austro-Hungarian monarchy as it is to-day. Will the Hungarians, for example, welcome the addition of some ten million Slavs to the monarchy, with a virtual overturn of the present racial balance? At present Hungary is the dominant partner in the Hapsburg firm. That position she hopes to retain after the war. But if Austria wins emphatically enough to annex Poland, it also means victory over the Serbs in the south; in other words, an enormous addition to the Slav element in the monarchy which would crush Magyar influence under the sheer weight of numbers.

Great comfort is taken by the German press in the Belgian diplomatic correspondence captured at Brussels, and now published under German care. It all relates to five or six years ago, when the Entente was forming, but is proof enough to the German editorial mind that England was then plotting war, and so is responsible for the war declared last year by Germany. This is, of course, to ignore the offers made in July, 1914, by Sir Edward Grey. If he had been seeking the war, he was strangely reluctant to let it begin. He would have allowed Germany to call an international congress where and when and how she chose, to avert the war. But the Kaiser would not have it. And apparently he would now have us for-

get that he ever received the chance. Full proof of the perfidy of England and Belgium the German newspapers admit that they have not been able to discover in the archives at Brussels. The implication is that the incriminating documents were removed to Havre. One wonders what sort of diplomatic correspondence would be found in Vienna or Berlin, if a hostile army should take one or both of those cities. At least, the treacherous English published their dispatches. Germany edited a few of hers, and suppressed those which it would have been inconvenient to print.

How many men has England at present under arms or in training? On July 20, Lord Devonport, a critic of the Government, speaking in the House of Lords, took it for granted that 3,000,000 men had joined the colors. Unionist peers are not given to overestimates, as we may gather from Lord Lansdowne's famous admission that less than half a million British were recently on the firing line. Taking, then, 3,000,000 for the volunteer army, we must add the military strength of Great Britain at the outbreak of the war, the official establishment then being 727,000 men. Of these a quarter of a million were Territorials, but the figures did not include the army in India. It is not certain whether Lord Devonport included the Canadians and Australians in his three millions, though from the context it would appear that he did not. He certainly did not include the native Indian contingent. Thus the total supply of fighting men would be three millions and three-quarters, or, if we include the Colonials, about 3,825,000. Up to the very day on which Lord Devonport spoke in the Lords, the official British casualties on land from the beginning of the war, in all theatres, was a little less than 322,000, of whom about four-fifths were wounded. Of these wounded, half should have returned, or be in a way of returning, to the front, leaving the net waste at about 180,000 men. Subtract this sum from 3,825,000, and you get 3,645,000 men as the present strength of the British forces, in the field and in training, regular army and Territorial.

These great numbers only give point to the now classic question, Where *is* the English army? For in the west the British hold but thirty miles out of a total of 500 miles. Many answers have been forthcoming. A great part of the volunteer army is, of course, still in training. Large reinforcements, it is now certain, have been sent and are still going to the Dardanelles. But unquestionably very large numbers are at home and in France, ready to enter the battle line, but waiting for heavy guns and ammunition. This leaves out of consideration possible questions of military policy; whether, for instance, it is the Allied plan to stand still in the west and to keep piling up millions of men for the formation of that "phalanx" which alone can break through modern intrenchments. As between the men ready to enter the battle line and those still in training, we have the following data: Last November it was announced that a million recruits had been obtained. These men have now had nine months' training or more. Add the three-quarters of a million in the establishment at the outbreak of the war and the Colonials and Indians, and subtract the waste, calculated above, of about 180,000 men, and you get about 1,650,000 men now available who have had from nine months to a year's training or more. If we reduce the training period to six months we have to add another half-million.

The reduction in the rates on anthracite, ordered by the Interstate Commerce Commission, is less of a surprise to the railways than to the public. What makes it particularly unwelcome to the former is that it comes on top of the disappointingly small increase in rates on other traffic granted recently. Each decision, in the minds of those most closely concerned, aggravates the other. Upon its merits, however, the anthracite reduction can hardly be challenged. As the Commission pointed out, this product is a "low-grade" commodity. It is handled by machinery, in all kinds of weather, placed on cars loaded regularly to their maximum capacity, in trains of maximum tonnage, and is unperishable. Yet it has been paying a higher rate than other commodities that do not possess these advantages of shipment. The Commission did not stop here. It went on to criticise certain practices of the railways, stigmatizing one of these practices as involving "unlawful rebates," and remarking that it "cannot overlook the fact that some force has brought the production and sale of most of the tonnage of this commodity under their control."

No other action of the New York Constitutional Convention is likely to be interesting in so many respects as its rejection on Monday night of the Barnes amendment, warranted to stave off any further workmen's compensation or widows' pension legislation. For its decisive vote against this proposal, the Convention is to be congratulated. The incident is not without importance as a demonstration of Mr. Barnes's influence in this body, since, with characteristic skill, he threw the short-ballot amendment into the scale, thereby bringing to his side Brooklyn Republicans whose convictions upon "social" legislation were shadowy, but who were willing to express their appreciation of a leader's opposition to an amendment that they disliked by recording their votes for one that he favored. The pitiful showing that he made after even this stroke renders it impossible for persons who are predetermined against the outcome of the Convention's labors, whatever that may be, to damn it by declaring that "Barnes" is written across it. Moreover, the whole State may lay aside partisanship long enough to rejoice with forward-looking Republicans in the spectacle of Barnes and his faithful few, including Lemuel E. Quigg, on one side, and on the other Elihu Root, George W. Wickersham, Henry L. Stimson, Herbert Parsons, and a majority of prominent Republicans, speaking and voting against a truly reactionary proposal.

The Governorship of Mississippi should hold no terrors for its next occupant. The Hon. Theodore G. Bilbo, who has won the Democratic nomination over four competitors, came into prominence, or notoriety, by "exposing" one Dulaney, who, according to Bilbo, had attempted to bribe him to vote for Percy for the United States Senate. Dulaney, it appeared, had actually given Bilbo $500 in currency. There was strong suspicion, openly expressed, that Bilbo was not actuated by any high purpose in this incident, but was merely trying to "sell out." However, Dulaney was acquitted. The Mississippi Senate had an investigation and censured Bilbo. In spite of these and other episodes, he was elected Lieutenant-Governor. While holding that position, he was indicted, along with a Senator, upon a charge involving something like bribery. Again he was acquitted. Then he ran for Governor, and all that remains between him and the office is the formality of the November election. The Memphis *Commercial-Appeal* is forced to conclude that "either Bilbo is of finer metal than many thought him to be, or the requirements for the Governorship of Mississippi have been reduced to a lower plane." His strength with the voters lies partly in his popularity among the unprosperous, "men who toil and do not reap in great abundance," whose champion he has proclaimed himself. But he hardly seems another Tillman.

THE GERMAN EXPOSURES.

We are not inclined to take quite so serious a view as does the New York *World* of its revelations in the shape of the letters stolen from Dr. Heinrich Albert, one of the representatives of the German Government, unless there should be other and, from the legal point of view, more compromising documents to come. If, for instance, it is found that there was a direct connection between the German representatives at 45 Broadway and the unrest in ammunition factories, then those who with money instigated the strikes must answer in the courts for this breach of our laws, whether they be venal labor leaders or Germans bent on preventing traffic in ammunition with the Allies. We cannot as yet find proof in these letters of a "conspiracy against the United States"; we do find fresh proof of the extraordinary stupidity with which the pro-German campaign has been conducted from the beginning.

But on the moral and political side, like all loyal Americans, we must resent deeply the extra-diplomatic activities of some of the German representatives in this country, and their German-American allies. We do not think that a military or naval attaché in Washington, whether he be German or French or British, should be concerned in the buying up of the supply of chlorine gas or otherwise interfering with legitimate business because his country is at war. This is not the battle-ground, and the acceptance of accredited diplomats at Washington does not mean that they are thereby entitled in wartime to become active workers for their country within our domains. Through legitimate diplomatic ways they are entitled to protest; by public appearances they are privileged to speak for their Fatherland—of course. But if they wish to know how diplomats should behave under the most distressing war conditions, we commend to them the story of Charles Francis Adams's representation of his country in England during the most trying time in our history. They will find that he did not try to buy up British shipyards that were building Confederate rams, or to instigate strikes, or to take completed products off their hands. Yet all the time Mr. Adams was brilliantly furthering the cause of his country by urging its cause and winning men of value to its side, although the odds were all against him.

Nothing to our mind has so proved the moral weakness of the German case as these frantic efforts to bolster it up by converting the American public that one of Dr. Albert's correspondents was frank enough to admit could never be converted. Has any one found it necessary to defend France's cause? Is any one carrying on a French information bureau, or founding a journal of the Viereck type, or carrying on a nation-wide propaganda on behalf of the French people? No; and we are frank to say that if it had been deemed necessary to do so it could not possibly have been done so blunderingly and offensively as the Vierecks and Ridders and Von Skals have carried on their campaign. It is as if they had deliberately set out to injure their cause by insulting every American from the President down. No wonder that Dr. Albert, being an astute person, desired last June to control the policy of the *Fatherland* before supporting Viereck any further with $1,750 contributions. He must have known how ably the *Fatherland* was serving the Allies under Viereck's guidance—so ably that the British and French Ambassadors could well have afforded to pay the $1,750 themselves. As for Viereck, his plight is really ludicrous, for it is he who has led the shouting about the "British-owned" press of New York, and here he is proved to be taking German gold for his patriotic American weekly! The *Fatherland* is now in danger of being laughed to death.

But, the retort will come: "You are not fair. Did you not fail to rebuke Cecil Chesterton and other Englishmen when they toured the country urging us to join the war, though you denounced Dr. Dernburg? Do you not know that the British and French representatives are merely huge buying agencies, freed from the necessity of converting public opinion deceived by French and English lies?" Well, if we failed to rebuke Mr. Chesterton and others, it was certainly not because we sympathized in the slightest with their war propaganda. If it should appear that the French and British Embassies are successfully concealing activities like those of the entourage of the German, we shall duly criticise them when the facts become known. We can not believe now that, with all these vigilant German spies and patriots about, Sir Cecil Spring-Rice and Ambassador Jusserand would not long since have been discovered and exposed, had they been in the same business. In any event, since it is a crime for a diplomat to be found out, they have committed no crime as yet. Not that one approves the theft of letters from anybody. The *World* must square with its own conscience their publication.

All told, the revelations are deeply damaging, even though they do not prove some of the things they are said to. They establish the fact that gold of the German Government is being used in this counry in large sums. That is quite enough. Woe to the American politician whose name appears on German-American platforms hereafter! The taint of Cobden Club gold will be as nothing henceforth. And woe to the newspaper or lecturer that takes the German side. "How much are you being paid by the Germans?" will be an inevitable question. That this is regrettable, we readily concede. The pro-Germans have a right to carry on a propaganda, to establish legitimate press bureaus and circulate news; the difficulty of it is that they have gone about it so badly, through paid agents, through false leaders, through agents guilty of every possible offence against good taste and the American spirit, that they can no longer get a square deal from our press or public. Here the boasted German efficiency has utterly failed. Germans are wonderful as organizers and soldiers, but in the higher realms of psychology and the spirit, Heaven knows, there are none to compare with them for wrecking their own cause.

THE REPLY TO AUSTRIA.

Several able notes have been sent by our State Department within the last year, but not one of them has been a more clean-cut piece of work than the dispatch to Ambassador Penfield in Vienna which Secretary Lansing gave out for publication on Monday. It is a reply to the protest which Austria recently lodged with our Government against the export from this country of munitions of war to the Allies. And to that protest it is a complete and crushing rejoinder. As regards both the law and the equities; in the matter of the duty of neutrals and that of public policy; in the discussion of established practice, the present situation in Europe and future possibilities, Secretary Lansing is strong and convincing.

It was the easier for Mr. Lansing to confute the reasoning of the Austrian protest, in that the latter attempted to set up an entirely new rule of conduct for neutral nations. Admitting that the sale of arms is perfectly legal, the Austrian Government argued that circumstances might make it at least unneutral. That is to say, when the belligerents on one side could not buy, or transport, war material, while those on the other side could, it might be thought of as an obligation of neutrals to maintain "an attitude of strict parity" with respect to

both. But, as Secretary Lansing points out, this not only is a novelty in the law of nations, but would compel a neutral to be continually sitting in judgment on the nations at war; to be deciding which had superior advantages, in one direction or another, that had to be reflected or counteracted by altering the rules of war and the course of trade; and to throw everything into legal and economic confusion. Moreover, there would be danger that such action might tend to embroil neutrals in the war. In a strained effort to appear impartial, they might easily fall into an attitude of hostility. Mr. Lansing neatly, and perhaps a trifle slyly, quotes a German authority on international law, Paul Heinicke, as taking the position that prohibitions of the export of munitions of war might be "considered as violations of neutrality, or at least as unfriendly acts, if they are enacted during a war with the purpose to close unexpectedly the sources of supply to a party which heretofore had relied on them."

This German opinion really goes to the heart of the case as it now stands between Germany and the Allies. Germany devoutly believes in preparedness for war. For years she has been piling up war material and factories and laboratories for its manufacture. And she would resent in the highest degree, and quite properly, any effort by a foreign nation, or by neutrals in combination, to deprive her of the benefit of all this preparation. Very well, yet Great Britain, too, has been making her preparation for war. But she concentrated upon her navy. Whereas Germany depended upon a huge army and endless artillery and mountains of shells, all ready, England placed her reliance upon ships enough to insure the command of the sea. But a part of the advantage of that command lay all the time in the fact that it would enable her to buy abroad the war material which she had not heaped up at home. And now it is coolly proposed that she be robbed of this fruit of her foresight and her sacrifices. In its essence, the Austro-German demand is that, on land, preparedness should be allowed to reap every benefit, but that on the sea it should not be permitted the greatest one.

In this connection, Secretary Lansing refers to the parallel situation which existed at the time of the Boer War. The Boer republics were blockaded by sea. They could not import guns and cartridges, just as Germans and Austrians cannot now. But England was in need of war material, and Germany and Austria freely supplied it. Mr. Lansing does not state his purpose in citing this precedent. He did not need to. Every reader can see how it at once makes grotesque the protests which Austria has made against our selling ammunition to the Allies, and also shows that Germany, in spite of all her professions of love for the Boers, and her tears at the crushing out of their republics by Great Britain, was perfectly willing to sell to England powder and guns for use against the Dutch in South Africa. It will be interesting to see if this part of Secretary Lansing's note is published in the German press.

In few but weighty words Mr. Lansing shows how the recognized international right to buy arms abroad relates itself to national policy. The alternative would be a complete going over to a stark militarism. Knowing that it could get no war supplies from others, each country that felt itself in any way threatened would feel compelled to spend all its energies on manufacturing guns and explosives. An added premium would be put on the aggression of the stronger, and small nationalities would live in fear and trembling. This might not seem to Germany an undesirable result, but it surely would to the United States.

WHEN THE GERMANS TURN WEST.

As Berlin professes to view the situation to-day, Germany's military position in the opening weeks of the second year of the war does not differ in essence, though varying in detail, from what the Kaiser's strategists expected it to be at the end of the first month of the first year of the war. Germany's problem was to beat one enemy and then turn upon the other. By the first week of September, 1914, the first part of the programme was to have been virtually completed. The French armies were to be disposed of, with Paris taken or doomed. Then would come cleaning-up operations against Russia, more deliberate in nature but with preordained result. Up to September 5, 1914, it actually looked as if the first part of the programme were being realized, but then came the change on the Marne, with after-effects in Flanders and in Russia. To-day the situation is reversed. It is Russia that has given way first. But as Berlin might argue, and does argue, this is a matter of detail. The essential nature of the great plan is still the same. The enemy on one side has been struck down. There is now leisure for dealing with the enemy on the other flank. And the implication is that whether France went down first, or Russia, does not really matter.

This implication is not in the least justified. It does make a vital difference whether Russia or France was the first to succumb —assuming for the moment that Russia in a military sense is out of it, so far as the German forces are concerned. The situation is different in one respect, that whereas Germany counted upon beating France in five weeks she has taken a year to beat Russia, and has done it, up to the present, less completely than she expected to put through the job in France in five weeks. The difference in time elapsed is a second factor. It means that the Germany which will turn to deal with France after a year of war cannot conceivably be the Germany which would have turned about to deal with Russia after five weeks of war. The strain of a year's efforts, the enormous losses, the gathering economic burdens, have been felt. The German rush against the Allied defences in the West, if it does come, cannot come with the fresh ardor, the initial energy of the first onset of last August. The psychology of the situation is utterly different. If Germany's victorious legions had marched against Russia last autumn, it would have been in the easy consciousness that the main part of the work was done, that the rest of the campaign would be something of a procession. To-day the German armies, if they turn west, must do so with the feeling that the holiday part of the programme is over and that the real work is about to begin.

Specifically, the difference in the problem as it was envisaged by Germany a year ago and as it stands to-day may be thus stated. If the German forces, with France disposed of, had turned against Russia last autumn, they would have marched against an army that might ultimately amount to, say, five or six million men. Of course, there was much wild talk during the early months of the war concerning Russia's unlimited resources. Newspaper arithmeticians spoke of ten million armed Slavs, fifteen millions, any number. Yet it needed only a moment's thought to show that Russia could bring no such forces into the field. Arguing from statistics of population meant nothing. It needs organization of a high kind to bring to bear the potential strength of a nation at war. If we put the possible military strength of Russia at five or six millions we are near the truth. And against those millions Germany not only would have had equal numbers of her own, but she would have had the Austrians.

To-day, if the German armies in Russia are sent against the Allied line in France, they go to meet as many French and British

as they would have had to meet Russians last autumn. In another column we print figures which show that England has under the colors at least three and a half million men, of whom two millions have had a minimum of six months' training. The French army, with its reserves, would come close to making up the total of five millions. Italy also counts. The superiority of the French or British soldier, man for man, to the Czar's peasant soldier is unquestioned. The superiority in organization, in resources, in staying powers need not even be discussed. In the matter of leadership it is probable that France, in the person of Joffre, has produced the one genius of the war. On the attacking side, if Germany should choose to attack, there are not available the Austrian forces, which are needed to keep Russia in check even in her present condition. In a word, the British and Italian armies to-day are nearly equal in number and superior in total fighting resources to Russia at the height of her power. So that when Germany faces west now she faces an opposition as powerful as she confronted at the beginning of the war. In other words, at the beginning of the second year of the conflict Germany has the war to fight all over again.

THE STEAMBOAT INSPECTION SERVICE.

The indictment last week of the captain and engineer and of the officials of the company owning the Eastland is welcome. At least we shall now have a judicial inquiry not only as to the culpability of those directly in charge of the safety of the ship, but of those more remotely responsible. The grand jury found that the failure to correct the instability of the vessel indicated "criminal carelessness or incompetence on the part of all persons connected with the . . . inspection of the boat." It charged, further, that the Federal inspectors were generally untrained men, and recommended that the whole steamboat inspection service be turned over to the Navy Department—a severe arraignment in itself.

To this Secretary Redfield has rejoined by two orders. The first permits hereafter no increased passenger-carrying license except after a personal inspection of the vessel—a simple requirement which ought surely to have been prescribed years ago. The second calls for "inclining tests" of any vessels whose stability the inspectors have reason to question, to be made by the owners under the supervision of expert naval architects to be provided by the Department of Commerce. Thus is the door of the stable locked after the horse is stolen, and thus does the Secretary of Commerce recede from his too hastily assumed position that he had no more to do with the stability of vessels than a building inspector with the stability of skyscrapers. Nothing should, however, interfere with President Wilson's reported intention personally to go into the facts of the disaster to the Eastland with a view to placing the exact responsibility and to making recommendations to Congress for any additional legislation that may be needed. It may possibly be discovered that none is needed, just as Mr. Redfield has found the necessary authority to order tests of stability. But this does not appear probable to us, and the fact is that doubts as to the value of all the personnel of the service have persisted ever since the disaster to the Slocum.

It is true, however, that there is no law on the statute-books which gives the Government control over the structural strength of vessels. The rules of the inspection service specify in detail the requirements as to life-saving equipment, and the provisions of the new La Follette Seamen's act are even more comprehensive. But the plans of a ship, as well as the question of stability, are left to the builder's judgment; and the only supervision over construction is that exercised by the various classification societies, such as Lloyds and the Bureau Veritas, acting for the underwriters and shipowners. To be sure, the Federal hull inspectors are supposed to be competent to determine the strength, seaworthiness, and other qualities of the hulls of vessels, and the boiler inspectors have similar functions in regard to boilers and machinery, but their inspections are apparently confined to completed ships. Thus a structurally weak or top-heavy vessel has hitherto been held to fulfil the requirements of the Steamboat Inspection Service, if her owners have provided the life-saving equipment specified by law. In view of the growth of our merchant marine the question is whether the time has not arrived for the formation of a governmental bureau of naval architects, with authority to pass on the plans of all vessels built in private shipyards.

One reform that should certainly be carried into effect relates to our methods of conducting inquiries into marine disasters. The local inspectors of the district in which an accident occurs constitute the board of inquiry. They have authority to examine witnesses under oath, but their sittings are secret, and the accused shipmaster or officer is not allowed the assistance of counsel in answering questions. An appeal from the Board's findings may be taken to the supervising inspector of the district, and from his decision there is an appeal to the supervising inspector-general, the final authority. In these secret inquiries highly technical questions of navigation are frequently involved, questions upon which a boiler or hull inspector may or may not be qualified to pass; and it happens on occasions that the Board has to investigate the responsibility for its own acts—a proceeding that does not encourage trustworthy conclusions. In contrast, Great Britain's method of investigating marine accidents is better calculated to bring out the truth. There the court of inquiry is presided over by a judge, who is assisted by nautical assessors, usually shipping men of high character. The rules of judicial procedure govern the inquiry, the defendants are represented by counsel, and, what is still more important, the proceedings are open to the public. It is true that the inquiries into the disasters to the Titanic and Lusitania have by no means convinced observers that the English system is the ideal one; but at least we do not find inspectors passing on their own acts behind closed doors.

In England the evidence is accessible; here it is not. Whether this can be altered by Executive order or only by legislation is for the President to determine; but there can be no question as to the desirability of a change. Nor should Secretary Redfield's almost hysterical reply to the criticisms of him and his subordinates made in Chicago prevent a searching inquiry as to the competence of the present inspectors, concerning which the grand jury has such grave doubt.

BLEMISHES OF THE INCOME-TAX LAW.

The report made last week to the National Tax Association at San Francisco, on the Federal income tax, deserves wide reading and study. It merits more serious consideration by Congress than Congress will probably give to it. The report was drawn by a special committee of special competence. On it were authorities on taxation like Professor Seligman, Thomas S. Adams, and Professor Bullock, together with several men of affairs. Their analysis is careful and their conclusions cautious. And they are able to point out several defects and a few outright injustices in the income-tax law, as it stands,

the removal of which ought to be sought from Congress.

A part of the committee's criticism goes to the form of the law. As everybody knows who has read it, this is a miracle of complicated and involved draughting. The fearfully long sentences, with their many "provideds"—some of these inserted in the middle, some dragged in at the end as if to eat up what has gone before—seem as if purposely intended as a jungle in which the taxpayer would be certain to lose his way. It is true that we now have a series of Treasury decisions, clearing up many of the ambiguities of the statute as enacted—or arbitrarily ruling what it means. The result is that at present a skilled lawyer, with these aids at hand, is generally able to guide a client through what appears to the latter a mighty maze without a plan. Nevertheless, the committee urges that "the language of the law is in need of great improvement." Some of the words it makes use of urgently require definition. They are employed in different and subtly elusive meanings. Thus the word "deduction" has at least four different senses in different parts of the act. The committee will find many in sympathy with it when it declares for "a complete restatement and clarification of the law."

It has, moreover, objections to make which go deeper than the mere dress of the income-tax law. There are inconsistencies in this law, unfairnesses, and needless burdens, which constitute blemishes affecting the very substance. These the committee points out in order, always in a spirit of moderation, and in each case with the suggestion of the appropriate remedy. Many of the injustices have to do with the section of the law concerning payment at the source. Some of the provisions of the statute compel, if they did not contemplate, double taxation. Thus a holding company is not entitled to deduct the tax already paid on the dividends of a subsidiary corporation. And on account of the confusion which exists about the "claims of exemption" made by the individual bondholder, in cases where tax-free bonds are guaranteed by a railway, for example, it often happens that both the corporation and the bondholder pay the tax. Most grievous of all, perhaps, is the heavy expense forced upon corporations that have to pay at the source. The committee has had a large amount of data before it, bearing on this question, and concludes that the cost of collection, thus imposed on corporations, "ranges from 10 to 20 per cent. of the amount turned over to the Government." In the case of one company, it was demonstrated from the books that it cost $7,000 to collect $35,000. This is a rank absurdity. How to do away with it the committee explains, but of the method it recommends we cannot here give the details. In general, the recommendation is that the law be amended so as to give the fullest possible *information* at the source, but to leave the Government to do its own collecting.

In the report attention is called to many minor inequalities in the existing income-tax law. One of them is the provision—or, at least, the Treasury decision—that if you make anything on a speculative investment, the gain must be returned as income, but that if you lose anything, it cannot be deducted as a "loss in trade." This distinctly puts the Government in the position of saying: "Heads I win, tails you lose." The committee proposes that the law be amended so that all losses in investments may be deducted "where the gain, if any, would be subject to tax." It also has several other recommendations, such as allowances for the depreciation of property, deduction of taxes paid within the year in a foreign country, and of expenses of management in an investment business, which strike one as both sensible and just. Finally, the committee advocates one incidental reform which the *Nation* has more than once declared to be highly desirable. This is a much more elaborate publication and analysis of returns of income-tax. Other countries give far more complete information. It is open not only to lawmakers and students of economics, but to business men. The income-tax statistics of England and Prussia furnish a model to which our own Government should be empowered and directed to conform.

A report of this kind is really a public service. Here we have the work of experts giving their time and labor freely. The Government had its paid employees to work on the preparation of the income tax, but it is safe to say that their labors were of nothing like the value of this report, now placed voluntarily at the disposal of Congress. How much consideration will be given to it, every man may guess for himself. For our own part, we fear but little. There is talk of raising the rate of the income tax—it would have to be increased many fold if our excited militarists had their way—but there is no talk, so far as we have heard, of making the present tax fairer. Yet we shall not despair of the influence of this able report. It will appeal strongly to business men and taxpayers; eventually, it may penetrate to the intelligence of Congress.

Foreign Correspondence

THE VISION OF THUCYDIDES—A COMPARISON WITH THE PAST.

By JAMES F. MUIRHEAD.

LONDON, August 1.

Are the English really the spiritual heirs of the Athenians, the Germans of the Spartans? The author of the "History of the Peloponnesian War" seems inclined to think so. He must surely have had the British Empire in his prophetic eye in many of the sentences put into the mouth of Pericles when delivering his famous Funeral Oration. Thus:

"If our more remote ancestors deserve praise, much more do our own fathers, who added to their inheritance the empire which we now possess, and spared no pains to be able to leave their acquisitions to us of the present generation. Lastly, there are few parts of our dominions that have not been augmented by those of us here, who are still more or less in the vigor of life; while the mother country has been furnished by us with everything that can enable her to depend on her own resources whether for war or for peace."

"Our constitution does not copy the laws of neighboring states; we are rather a pattern to others than imitators ourselves."

"We celebrate games . . . all the year round, and the elegance of our private establishments forms a daily source of pleasure and helps to banish the spleen; while the magnitude of our city draws the produce of the world into our harbor, so that to the Athenian the fruits of other countries are as familiar a luxury as those of his own."

The sibylline vision of Thucydides takes in even such special points as the trouble we were fated to have from interned enemies and German spies: "We throw open our city to the world, and never by alien acts exclude foreigners from any opportunity of learning or observing, although the eyes of an enemy may occasionally profit by our liberality; trusting less in system and policy than to the native spirit of our citizens." When, however, he wrote, " . . . we do not feel called upon to be angry with our neighbor for doing what he likes, or even to indulge in those injurious looks which cannot fail to be offensive, although they inflict no positive penalty," he seems to have failed to foresee the "khaki scowl" which those of us who are too old to fight turn self-righteously on the younger men who still cling to the garb of civil life. Our natural antipathy to the German school system is clearly foreshadowed in the words: "While in education, where our rivals from their very cradles by a painful discipline seek after manliness, at Athens we live exactly as we please, and yet are just as ready to encounter every legitimate danger." The boast that "we Athenians, fighting upon a foreign soil, usually vanquish with ease men who are defending their homes" has a suspiciously Britannic ring, though "Scarborough" bombardments and Zeppelin raids may have introduced just a shade of quaver into the voice of the boaster. And has any contemporary writer summed up the advantages of freedom from conscription more pithily than Thucydides in these words?—

"And yet if with habits not of labor but of ease, and courage not of art but of nature,

we are still willing to encounter danger, we have the double advantage of escaping the experience of hardships in anticipation and of facing them in the hour of need as fearlessly as those who are never free from them."

We trust, too, that he was equally a seer in making Pericles assure his audience that the children of the fallen would be brought up till manhood at the public expense. Another forecast that we may, perhaps, take in some degree to ourselves is not flattering:

"You visit the disasters into which the whim of the moment may have led you, upon the single person of your adviser, not upon yourselves, his numerous companions in error."

The resemblances of Germany and Sparta are on the surface. Each is a great military power engaged in a war with a great naval power. In each the individual is thoroughly subordinated to the state; and in each the main object of education is to produce the efficient soldier. Both pursue very definite ideals, and both strain every nerve to attain them. In each case (perhaps a Briton may be allowed to say) the ideal is not wholly worthy, and in each case it is striven for with a total disregard of the rights of others. Thucydides's prevision of German education has already been referred to. He also notes the evil effect of German prosperity since the war of 1870-71: "Great good fortune coming suddenly and unexpectedly tends to make a people insolent . . . it is easier to stave off adversity than to preserve prosperity." The vatic power of the historian enabled him again to foresee the case of Belgium, and to realize that a mistake would be made here: "Envoys told Aleidas that he was not going the right way to free Hellas [read, "to benefit Germany"] in massacring men who had never raised a hand against him, and who were not enemies of his, but allies of Athens against their will [read, "neutral by decree of the Great Powers"], and that, if he did not stop, he would turn many more friends into enemies than enemies into friends." Quotations such as these (all taken from Books II and III of "The Peloponnesian War") might be multiplied, but those here set down are probably quite enough to drive my point home.

"The War, Its Social Tasks and Problems," is the subject for study at a summer school now in session at King's College. The two main courses of lectures are being delivered by Prof. Patrick Geddes and Dr. Slater, head of Ruskin College. It is interesting to find so pronounced a pacifist as Professor Geddes admitting the advantageous influence of the war on our young men. "They are better set up, manlier, than they were; they are restrained, vitalized, and disciplined as peace did not vitalize or discipline. The slackness of the youth at the street corner has gone, and this dramatic change is before us all." Dr. Slater paid a compliment to an element of superiority in the German Government, as compared with those of England, France, and America, "in that it is less influenced by considerations of material advantage. It is less 'pulled,' it is less capable of being exploited by the private interests of individuals." Now this does not in the least imply that there is a greater amount of original sin in, say, the United States than in Germany. At its worst it is simply the seamy side of democracy. In a land of equality, where the principle of "live and let live" is peculiarly current, it is not strange that men even of high personal character will sometimes wink at actions of others which they would disdain for themselves. It is quite easy, too, to see why, in a benevolent despotism like that of Germany, official corruption must be sternly curbed. Class privileges there are so strongly intrenched and rest on foundations so deeply laid that it would not pay to lower the standard for the pecuniary advantage of a few individuals. We must remind ourselves of Lord Bryce's wise warning against the assumption that the same phenomena in two different countries must necessarily imply the same sort of causes. We have "to realize the existence in the American people of a reserve of force and patriotism more than sufficient to sweep away all the evils which are now tolerated, and to make the politics of the country worthy of its material grandeur and of the private virtues of its inhabitants."

NEWS-MAKING AGAINST FRANCE—THE QUESTION OF ABSINTHE—THE ANARCHISTS.

By STODDARD DEWEY.

PARIS, August 1.

Absinthe is not fed to the French soldier to excite him to fight. It is physically impossible, it is morally impossible, and it is actually not a fact. Here in Paris we are thunderstruck that such an assertion should be made in New York at a responsible peace meeting. We can only suppose that it is one more of the anti-French news-fabrications—in the interest of whom? Doubtless, of the belligerent having the sympathies of those who retail them to innocent pacifists. And these forget that France is fighting for her life against an invader who has already destroyed the homes and farms and factories of one-seventh of her population.

The absinthe story is one of those deftly put in circulation in the United States, where it chimes in with a popular prejudice. Fabricated news to stir up discontent and dissension in France itself is also common and has been traced back in a few cases to an Anarchist propaganda, which has made interesting reading lately. But what about absinthe?

Ever since the first unhappy days of war, the commander-in-chief took stringent measures to keep strong drink generally from his soldiers. The civil authorities took the occasion to forbid throughout the country both manufacture and sale of absinthe in particular. It still happens that the police in cities and towns raid some liquor shop clandestinely selling absinthe from its old stock. Such sale is much more difficult than moonshining in North Carolina. And, as all manipulation of alcohol in France has to be performed under Government inspection, it is impossible there should be any clandestine fabrication of absinthe—except of stories about it.

How in the world from quantities which would have to be hidden somewhere French officers could get enough to fire their men to action would be more than a mystery. Then for those soldiers who are not accustomed to this mixture of drug and alcohol—as the majority must be, since that is the case with the majority of Frenchmen in civil life—such administration of absinthe would risk making them idiotic just when they need their senses most or would send them puking over the battle range. No, if peace negotiations are ever to begin from the United States, there must be a little more accurate information and a truer appreciation of the war than such stories furnish.

Wine, which, with beer and cider, has always been counted among "hygienic drinks" in French legislation, forms a part of the soldier's daily rations—about a pint a day. Such red and white wine, averaging from six to ten degrees of alcohol, is the common table drink of Frenchmen of all classes. Their stomachs demand it just as much as Mr. Gladstone's did tea at five o'clock. There is talk of increasing the ration, which might be done profitably from the point of view of food; but they are first trying to give more coffee, which Michelet says caused the French Revolution. To get morally "forwarder" for battle, a soldier would have to drink so much wine he could not run!

Not only at the front, but for "permissionnaires" enjoying a few days' furlough at home and for soldiers in camp or garrison, no café or restaurant or bar or liquor-selling place of any kind is allowed to sell at any time any alcohol at all, brandy, bitters, or vermouth, or liqueur, to any military man, officer or private, in uniform. The utmost concession which petitions have been able to extort from Gen. Gallieni, commander of the fortified camp of Paris, does not yet extend to the sale of medicated wines (quinines and such) at 15 degrees of alcohol. And no military man in uniform can be served at all, not even with mineral water, except from five o'clock to nine—before and after the dinner hour. Only on Sundays are these hours prolonged. Like every one really living among actual Frenchmen, I have experience of the enforced observance of this regulation of the military authorities; and the veriest outsider with his eyes open can see it any day in Paris in the cafés of the boulevards.

Whether the French Parliament will have the courage—and the power—to stop altogether the making and selling of alcoholic drinks proper until war is over is another question. But it has been asked to do so.

As for Anarchists, most Frenchmen just now look on them as rather less dangerous than pacifists. For, on the latter, indeed, they look very much as our Southerners did on the first Yankee schoolteachers:

> ——with as favorable eyes
> As Gabriel on the Devil in Paradise!

Returning from Spain in 1892, I found the preaching of the Anarchist gospel exploding all around me. The day after I left Barcelona, a bomb was thrown in my favorite corner of the Plaza Real. Ravachol, who loved peace and little children, threw his final bomb in a Paris street from which it was heard at the terrace of the café where I was taking the air. After he was guillotined, his memory was kept alive by postal cards representing him crucified against a sunburst. My newspaper letters in those years would form a volume of the history of Anarchy. Then, for years there was a lull, with only solitary instances or intellectual talk, when suddenly Bonnot's band, robbing banks and killing from Paris to Belgium and defending their war on society by the gospel of Anarchy, stirred curiosity for a time. And here they are again.

Fabrication of news, dangerous to the community in present circumstances, was the charge brought against four of these Anarchists last week before the Third Council of War. Three little sheets distributed clandes-

tinely had been traced back to them. One had Zola's title "J'accuse!" It assured those who received it by mail, or picked it up in the subway or at their house-door, that war had been declared owing to the Jesuits exciting the enmity of "Luther's Germany against Voltaire's France!" The same parties had already caused the war of 1870, Waterloo—and the assassination of Jaurès. After proper anti-militarist insults against generals and army and government generally, it wound up with a particular appeal for peace: "Vive la Paix! Vive Jaurès! Vive Caillaux!" It was said by the way that Joan of Arc was "the incarnation of free thought!"

The other two fly-leaves which have been seized were devoted to pessimistic news under the titles, "They deceive us" and "They lie to us!" In Paris, the news thus retailed under cover usually tells of disasters at the front, supposed to be concealed by the authorities; or it exaggerates the power and deeds of the Germans. Among the soldiers at the front, similar fabricated news tells of revolutionary outbreaks in Paris or descends to warning husbands that their wives left behind are not faithful. A soldier from Troyes managed to telegraph back to that Socialist city to ask if the Mayor had really been assassinated, as he had been informed. Two other soldiers had received news quite as extravagant. This seems crazy, but there is method in it—and some one is paying for even such minute attempts to discourage soldiers and their families.

One of the accused is an old friend—the well-known millionaire Anarchist Prouvost. He made a French million in insurance and retired to philosophize and help out the "companions." This time he admitted to Col. Gouin, who presided at the trial, that the companions had made a "pear" of him and got away with more of his money than his $6,000 a year income warranted. During the one year's prison awarded him, he will have time to meditate on some safer way of remaking society. His wife, who lives separate from him with their three children, wrote to the court: "At bottom, he is sick and not bad, but very simple. He gave out his money to a set of individuals who used to come to the house and frightened me greatly." Prouvost is supposed to have got his anti-military ideas from seeing his uncle, who was a colonel, presiding at one of these military courts. He professes to have been successively a Socialist, an Anarchist, and now—an "auto-democrat." Such is the virtue of labels for some minds.

One type of the Anarchist mind was the woman of the band—a sort of medium who seemed a little uncertain whether she called spirits from the vasty deep or incarnated them. Her manager, who has written a "Secret of the Universe," insisted on being called a "savant." He said his Lucile "called up or incarnated (there is, he said, a dispute about the proper word) Robespierre, Ferrer, and Joan of Arc!" But the woman, unhypnotized, vehemently denied that she had ever incarnated Joan of Arc and turned quite red about it. Her husband, in an effaced way, threw blame on other women's jealousies and said he was not curious himself. One man, who was not caught, had the traditional semblance of the *agent provocateur*.

The lawyer trying to defend these philosophers pointed out that their appeal for peace began—"Women, in the name of Christ!" The savant's defender, the celebrated Maître Lagasse, remarked that the fly-sheets must be "German productions. You have only to read them to understand that they have been drawn up not only by a German, but by a Protestant German, a Lutheran!" Shades of the Dreyfus trial!

It is not the first time Spiritism crops up in these cases of militant Anarchists. With Emile Henry, it was after he had been guillotined. A doctor, a pupil of Charcot, then reigning, had at the time a peculiarly sensitive subject—a young woman whose family was imprudent enough to allow her to attend the trial of the Anarchist. His youth and education excited much interest, in spite of his horrible attacks on non-combatant society. It is true he justified himself by answering the question—"Why did you kill innocent men and women?"—"The poor and those who die of hunger are also innocent." The morning of Emile Henry's execution, which had been kept from the knowledge of the press, this young woman in her home suddenly awaked and declared herself possessed by the soul of the guillotined man. What is more, she talked like him—and like Dr. Charcot—and some highly interesting séances were held in the house of a great Paris lady.

Fortunately, the present Anarchist offenders have killed nobody—not even their people's confidence in the just outcome of this war. The maximum sentence—for medium and savant—was only three years in prison and 1,000 francs fine.

The State University and Politics

THE UNIVERSITY IS NOT IN POLITICS, BUT POLITICS IS IN THE UNIVERSITY.

By GRANT SHOWERMAN.

I.

Those who from time to time since the beginning of its history have prophesied ill of the State-university idea no doubt experience a certain satisfaction in reading the press comments of the past few months on the confusion of State education and politics as exemplified in the situation at Wisconsin.

Yet what has happened in the development of the relation between the American State university and politics in general is not what was most frequently and most confidently predicted. The professorial chair has not become part of a spoils system, and the classroom has not become the instrument of party politics. The "professor in politics" is still illustrated by only one great example, and that one is not a product of the State university, and not a politician in the usual sense. In no State university—certainly in no State university of repute—is there any appreciable connection between political activity and the professor's chair. In Wisconsin itself, which is at present most on the public tongue, it would be safe to defy any one to name a half-dozen of the faculty of six hundred who have received their appointments for political reasons, used their chairs for political purposes, actively identified themselves with any "ring" or "gang" or "crowd," or otherwise been the instruments or promoters of offensive partisanship. Whatever may be said to the contrary, and whatever to those at a distance may seem to be the contrary, neither the University of Wisconsin nor any other State university that pretends to standing is in politics. The thing is impossible in nature. The qualities which alone confer standing upon the university are incompatible with politics. The university ideal precludes the politician. The professor become partisan loses academic standing, first by lacking the scholar's attitude, and secondly by falling in the scholar's achievement. If he multiplies to a noticeable extent, his institution loses caste.

The State university is not in politics except in the larger sense in which all good citizenship is and ought to be in politics. In the professor of a State university the sense of responsibility to the commonwealth, which all conscientious citizens feel, has been intensified by the fact of State employment. He has been called upon with more and more frequency, and has responded with more and more willingness to the call, to confer upon the State at large in extra-university matters the benefit of the special knowledge and skill by reason of which he occupies his chair. As engineer, chemist, geologist, agriculturist, political economist, hygienist, historian, essayist, linguist, lecturer, organizer, he has rendered service of incalculable importance in the development of the State's cultural, social, and material resources. He may with absolute security challenge any other profession or any other class of society, except the clergy, to present the record of a more willing or a less mercenary contribution to the common good. The State-university man's response to the public need has not been that of the politician and the partisan, but that of the good citizen.

II.

It has been the misfortune of the University of Wisconsin that progress and Progressive are words that look and sound very much alike. The university man is not Progressive, but progressive. In the same way, too, he is conservative, not Conservative. His attitude is academic, not political. He believes in the use of scientific accomplishment for the improvement of life. He is not for candidates and parties, but for ideal human relations. That is his platform under all administrations. If it has been the Progressives to whose call for expert assistance he has responded, his response has not for that reason been the response of a partisan. His partisanship is only for science. He is progressive in principle, not in party; he is scientifically, not sentimentally, progressive. He is an instrument of the State, an adviser, an expert, but not an exploiter. In the rare cases where he seems to be attempting leadership in politics at all, closer inspection is reasonably sure to reveal that it is not political interest, but intellectual enthusiasm, that drives him. He is still academic. There is no one so hard

to rouse over personal issues in politics, no one so independent of party authority, no one politically so unclassifiable.

It would be useless to deny that the university man sometimes sins from excess of enthusiasm. The "new humanities" are young, and there are other subjects and activities not yet fully arrived at the age of discretion. "Service to the commonwealth" itself, though as old as Euripides and Athens, thinks itself young. All these have had their little successes, and acquired a more than proportionate self-confidence. By reason of the confidence they have passed the blushing stage, while still by reason of youth more or less ignorant of themselves and the nature of man. They are still capable of belief that education can be "brought down" to all the people, and that all the people, when they see the apple dangled before them, will eat with appetite and go on their way much increased by the knowledge of good and evil. They are still capable of believing that justice is chiefly a matter of social science, and that some alliterative remedy like the Civic Centre can be made an efficient substitute for the Plan of Salvation.

At least, this is the way it sometimes appears to the innocent bystander. Yet in justice it should be added that even the sober and demonstrable truth is often alarming to the unaccustomed. What Emile Faguet says of dramatic art is equally true of new ideas: *Mais toute pièce à la fois très belle et très nouvelle ne peut pas plaire à la foule en sa nouveauté. Cela peut consoler de leurs échecs les hommes de génie et quelques autres.* The people do not understand and are afraid of the ideas of geniuses—and even of *quelques autres.* The problem of the university professor is not wholly unlike that of the Presbyterian pastor: "to preach the truth as he sees it without scaring his grandmother to death."

A little too much of this exaggerated minuscular progressivism, in unlucky combination with a little too much of the somewhat less innocent majuscular sort, partly because of the attention it drew, but mostly because of the bills it ran up, is responsible for most of the popular distrust of the university recently manifested in Wisconsin, and for most of the popular belief that the university is in politics. And yet, in so far as the university is concerned, this is not politics, but academic enthusiasm. Further, it is enthusiasm whose very excess is chargeable to the popular demand for "usefulness" in education, and is thus a fault that goes back to the democracy itself. In like manner, the president's oft-criticised biennial appearance before the legislators is not politics. The people expect the university to care for their sons and daughters; its fixed income is not sufficient, it must have appropriations, and its president must interpret its needs. This is not lobbying, and it is not politics.

The State university is not in politics. The "university crowd" exists only in the well-prepared imaginations of a real "crowd."

III.

The university is not in politics, but politics is in the university. Those prophets who foresaw a faculty of aggressive politicians and a neglected or wrongly used classroom were mistaken. The prophets, fewer in purpose and nobler in vision, who foresaw the educational ideal endangered by a dependent relation of the university with the people, were right. The aggressor has not been the university, but the politician, the legislator, and the populace. The university is not suffering from partisanship and neglect within, but from partisanship and pretentious ignorance outside. The danger is not that the university will tyrannize over the people, but that the people will tyrannize over the university.

This is just as much in the nature of things as it is in the nature of things for the university man to be non-political and non-partisan. The logic of the situation at Wisconsin, or elsewhere—for the situation differs only in degree—is easy. The university is a State institution; it is supported by the good money of the people; therefore the university belongs to the people, and the people are its masters; therefore the people have the right to the kind of university the people want. Really, so much could have been seen without the aid of even a logician, to say nothing of a prophet.

Theoretically, and in so far as legality is concerned, this is unimpeachable logic. In practice, like a great deal of other logic, it is nonsense. The intellectual life, whether general, professional, or technical, thrives only on freedom, and in our present stage of development it is impossible that the control of the people should not curb its freedom. The intellectual life, like the religious, is a growth, not a manufacture; yet the people conceive of regulating it like a branch of business. The intellectual life, like the religious, is understood only from within; yet the people presume to understand it from without. The intellectual life, and the conditions of its realization, can be judged only by experts; yet the important task of passing upon its ideals and methods is placed in the hands of a "boys-we've-got-to-win-this-game" sort of professional investigator, with a corps of "trained assistants" who work for a minimum wage and "the experience." For the investigation of legal, industrial, commercial, and technical and professional matters in general, the people employ commissions of experts. In university matters, they pass judgment through boards and committees chosen on the principle of representing all professions, all classes, all Congressional districts, all parties, all hyphenateds, and all sexes. The kind of expert who investigates the university, who votes on bills for its support, who sits on committees for its regulation, qualifies before everything else as a "representative of the people."

If the State university were wholly supported by a fixed income, as it is in part, it would, of course, still be under the ultimate control of the people, and the control would be less injurious, and, conceivably, even wholesome. But the State university, almost without exception, is growing rapidly in numbers, in the vision of its possibilities as the instrument of the State, and in eagerness to realize the vision. If it is merely to receive within its walls and adequately care for the sons and daughters of the State, to say nothing of growing to the stature of which it is capable, it must ask of the people through every Legislature a supplement to its fixed income. So long as this is true, it must be the potential object of threats, the prey to immediate uncertainties and fears, and, to some extent, the opportunist.

Let it not be thought that the withholding of appropriations in itself represents the extreme of disaster for the State university. For that matter, it has hitherto been treated with comparative generosity. The real danger is not from niggardly legislation, but from the loss of liberty entailed by the conditions of popular support. The State university could well do on less money and more freedom. It is not inconceivable that a fixed income with a fixed number of students might have some good results not attainable at present. It is only when the gift of the people to the university does not increase in proportion to the demands of the people from it that the evil is wrought.

"We cannot make bricks without straw," says the university.

"Yes, you can," answer the people; "and what's more, we'll see that you do it. For whom are you making those bricks, pray,* if not for us? We're paying for them, and we guess we can have bricks without straw if we want them."

The university expert doesn't believe in that kind of brick, and he is ashamed of the manufacture; but he finds it hard not to be forced into obedience to the experts of the people.

IV.

Pass in review the influences that restrict the freedom of the State university.

First, and farthest removed from real understanding, are the populace, who, in so far as they are interested at all, demand the admission to the university of every son and daughter able to profit by its privileges, and insist that the privileges include an enormous range of preparation, and that the preparation be of the practical sort directed towards earning capacity, and who, when the bill is presented, cry out in a rage at abuses which they never can specify, but of whose existence they entertain no doubt at all. There are, to be sure, a great many of the people sensible enough to realize their incompetence in matters so far out of their sphere. To these is due the really generous support of many of the universities from the beginning; but theirs is not usually an aggressive friendship. At the best, they consent to a liberal policy, and refuse to be the tools of self-constituted "people's friends"; at the worst, they join forces with the suspicious.

*The language is according to Woolley. The way we really say it in Wisconsin is this: "Who are you making dose bricks for ennabow?"

Second are the candidates for State office who, for purposes which it is not necessary to explain, assume to be "the friends of the people." Under the circumstances of the ordinary campaign, a general and more or less innocuous agitation against extravagance and impractical business methods in the university is all that happens. The Legislature meets, the agitation is once more found to have been without substantial foundation, the appropriation bill, after the usual tactics, is passed, and things go on as usual.

But a special combination of circumstances may come into being. A party with very lively ideas may have been in power for several terms and worked off an excess of enthusiasm in legislation which has cost a great deal, and a part of whose plan has been the utilization of expert university knowledge. Then there may come what might be expected—a reaction against excessive enthusiasm and excessive taxes. Another party may make capital of the reaction. "The taxes MUST be reduced," it shouts, and the people applaud. But how? Well, among other things, there is the extravagance of the university. The university MUST be curbed, and its expenditures MUST be kept down. The candidates promise it. In order to remove the promise from the general realm of the ordinary promises of commerce and give it real efficiency, they place it, with a few other choice examples, in the party platform. The candidates are taken at their word, and elected. They are under sacrosanct obligation to do something about the university. They enter upon the work of office, and soon find, like every administration before them, that the university has not been guilty of double-dealing, that it has not mismanaged, that it has not demanded or used more than under the circumstances was necessary, that the professors are not wire-pullers, and that the president is a high-souled American citizen. They find, for example, among other things of the sort, that, owing to a mistake pure and simple (to be as charitable as possible) in the campaign statement of university expenditures for the last and most outrageous year, the cost of operating the institution was made to seem a matter of three-fourths of a million of dollars more than it really was. BUT, the people have declared against high taxes, and we have promised to reduce them. We are sorry, BUT——. And the university must go two years more with overcrowded rooms and overcrowded courses, and for two years more be the recruiting-ground for institutions which have learned to recognize that a university depends, first of all, for both usefulness and fame, upon men.

We have already arrived at the third restrictive influence, the Legislature and the State officials. Generous though the administration may be, it is in the nature of administrations to assume a hostile and not very complimentary attitude towards all bills for appropriation whatsoever. Every two years, therefore, the president, the deans, the directors, and many other university men, must prepare a statement of the institution's needs, and, through the administration, convince the people of the reasonableness of every item. These high-salaried experts, whose real business includes at least some instruction, must devote their time to appearing before legislative committees, and before the Legislature as a whole, with an amazing array of statistical charts showing the number of cattle kept from contracting tuberculosis during the past year, the number of germs kept from germinating, the number of people "reached," etc., etc. They must prepare other statements for the information of the Legislature and the public. They must correct the misinformation that appears daily in the press. They must explain away all sorts of silly slanders, and answer a thousand questions of the expert people voiced by the people's temporary experts on education. They must explain once more why so much time is given to graduate study, and whether research really pays. They must explain once more why foreign language should be required for entrance or graduation, and they are asked once more why English is not as good as any other language, and why it is not good enough for an American citizen. They must explain once more why French and German are not spoken in class, and why literature is not studied more in translation. They are asked once more whether fertilizer really pays, whether blooded stock really pays, whether the agricultural college really teaches boys to be farmers, whether the Babcock test is really a success, and why, if it is, the liberal arts professors don't do something equally useful. They are asked once more why a man should receive $2,500 for nine months' teaching of nine hours a week, when a State clerk gets only $2,500 for six hours a day for twelve months. They are asked once more why manual training and home economics are not better than algebra and Greek, why more office room and more buildings are needed when offices and rooms now may be found unoccupied whole hours at a time, why so many classes are in charge of young instructors, why professors do not have more office hours, why they are allowed to spend so much time in writing books or prospecting for the Trusts, why students and professors do not mingle more outside the classroom, why students from other States and nations are not made to pay a much higher tuition.

To all these questions the president and the deans and directors, if not all of the faculty, make patient and courteous answers. The preparation of them, their delivery, and the recovery from them, extend over most of the "legislative year." Then, unless there is a "survey," or worry over threats for the next legislative year, there is an interval of one year during which the high-salaried officers and faculty are presumably free to attend to the academic duties for which the State employs them. And then—why, then the whole process has to be repeated with a new Legislature and a public which has forgotten the explanations of two years ago.

Fourthly, there is the board of regents. This is a body of earnest, unsalaried, public-spirited men who are near enough to the university and possessed of enough breadth of view to understand the academic ideal, or at least to realize that they do not understand it, and to lend a sympathetic ear to the president of the universiy, who is himself a regent. Yet even in this body there is always the possibility of misunderstanding and friction. First of all, the board of regents is a body of business men, eleven of whose thirteen members in Wisconsin are appointed, one from each of the Congressional districts. In the second place, as the appointments expire at different times, there is a possibility of the continual presence of new members. When the new members, as may sometimes happen, take their places with the more or less aggressive purpose of "representing the people," or of not "submitting to the domination" of some one or other, or of reforming something or other, or of doing something independent and original at all cost, there is a period of turbidity, whose duration long experience has taught the friends of the university to estimate with a comparatively narrow margin of error. Stated in general terms, it is the period of time necessary for a capable, well-meaning, not too stubborn business or professional man to reach the conclusion that he is not fully competent to manage the complex affairs of a university without the aid of experts from within its walls. But the period may vary according to the capability, the intentions, or the degree of stubbornness.

With the president, we reach at last a controlling influence actually inside the university—the first real expert. But the president himself is not unmoved by the pressure of the crowd. He, too, may take it into his head to "represent the people," and may stand with one foot in the faculty and the other among the democracy. He has got the appropriation from the people this year, and in two years he must get another and a larger. Promises to the people must be kept, and the people's demands must be listened to. The people must not be irritated; they may elect a hostile Legislature. Above all, we must walk softly while the appropriation bill is before the Legislature. Administrative or educational matters which would ordinarily be settled on their merits must be settled during legislative years in a special way. The president and the deans may appear before the faculty in support of a proposal to drop a certain entrance requirement, or to abolish a language requirement, or to lighten the graduation requirement. The faculty are in reality overwhelmingly against the measure; they believe it bad education, a lowering of standards, and a sacrifice of the university's dignity; yet the president cracks the whip, and they vote it through—"because the people from all over the State are demanding it," "because, if you don't, depend upon it, the Legislature will."

Last of all—the satirist sometimes says least also—among the influences controlling the university ideal is the faculty. Not least,

of course, for, if any body of persons *is* the university, that body is the faculty. The faculty is the source of the university ideal, its incarnation, its conserver. The students as a whole must be classed with the outsider. It is the nature of the student animal to resist. He would resist the ideal education even if he believed in it, and just now he believes in the practical, and has infinitely more faith in his own than in the faculty's judgment. The very distrust of the people and the student is an evidence that the faculty is holding to its standards.

Yet the faculty is far from being uninfluenced by popular sentiment. It defers to the petitions of the student, it argues educational questions with him, it looks out of the window to see which way the wind of student sentiment is blowing, though usually there is some "friend of the student" who has had "special opportunities for being acquainted" with the student's point of view to raise the breeze inside—it justifies to him the subject-matter and method of its instruction. It not only accepts the word of the president for the necessity of taking to cover before the people and the Legislature, but yields before the same convenient argument when employed by its individual members. A department could be named, for example, which rarely introduces a measure that meets the approval of a majority; yet the professor in that department scarcely ever fails to carry his measure with the help of "the practically unanimous sentiment of the people of this State, which I have recently"—during a visit to the high school at Two Rivers—"had very deeply impressed upon me."

V.

The State university is not in politics, but politics is in the State university. There are those who accept the situation—who believe that the intellectual conditions of the State university should be adapted to the capacities of all the sons and daughters of the democracy who can profit by intellectual training at all; that we should not worry about standards so long as we are doing good; that if the university and the people are to get together, the university must come down to the people; that if the university is to lead, it must not set a pace that is too fatiguing for the rank and file, or a goal that they have no desire to reach. But no one not looking above all for comfort can reconcile himself to such a programme. It sounds too much like the French politician, who said: *Il faut bien que je les suive puisque je suis leur chef.*

There are others who believe in standards, and have faith that if only the eye of the university is kept single to the desires of the democracy they will in some way keep themselves aloft without the aid of bearers. These are those who believe that the cure for democracy is more democracy.

There are still others who believe that the bearers are necessary, and that in time the people will become enlightened and understand the university ideal.

"But how if a' will not understand?" says the watch.

Well, it isn't possible to "take no notice of him, but let him go; and presently call the rest of the watch together and thank God you are rid of a knave."

The best the watch and his friends can do is to thank God that the democracy is not a knave, and to pray God it may come to understand a little better, and to trust a great deal more.

If the watch is not a praying man, there is still one other resort—if he is a good sportsman. That is, to reflect that character is forged beneath the hammerstrokes of adverse fortune, and that the State university with resistance enough to survive the strokes will come out finely tempered.

But the subject is really one for prayer.

Notes from the Capital

A WELL-DISGUISED REFORMER.

Whoever is surprised at the recent appearance of Boies Penrose as a tariff-reformer must be unfamiliar with the story of his rise and progress in American politics. Penrose was at Harvard with Roosevelt, and shared the latter's notion that the proper place for a young patriot of aristocratic antecedents was in party leadership. Roosevelt prepared for his career by a couple of years at a law school; Penrose by reading Blackstone and the other standard commentators under the personal tutelage of Wayne MacVeagh, equally notable as a jurist and a reformer. Mr. MacVeagh's admirers welcomed his new disciple into their circle with enthusiasm. Had he not sought the very fountain-head for his instruction and inspiration? And had he not come by his aspirations for civic betterment through a distinguished ancestry? Was not one of his forefathers the close friend of William Penn, was not another associated with Jefferson in the acquisition of the Louisiana territory, and had not a third made a two-term record as Solicitor of the United States Treasury? Yes, and there was his father, a professor of medicine in the University of Pennsylvania and a citizen of public spirit. Where was a better line to spring from?

To the Legislature Penrose soon found his way, and there fell under the eye of Matthew S. Quay, who promptly slated him for a lieutenancy in the Republican "organization," and selected him as a candidate for Mayor of Philadelphia. But Quay's touch had ruined him for the reforming element of the Quaker City, who forgot all about his ancestry and everything else that was good, and bent themselves to the advertisement of whatever they could learn to his disfavor. They badly frightened Quay's man Martin, who had the handling of municipal patronage, and at the eleventh hour Penrose was dropped and another candidate named for Mayor. Quay swore vengeance, after the manner of President Jackson, when the Senate snubbed Van Buren's diplomatic ambition. "If they won't have him for Mayor," said the Big Boss, "let's see how they'll like him for something better!" And with one swing of his powerful arm he landed Penrose in the United States Senate. There Penrose has stayed ever since, entering this year upon his fourth term.

His service as a Senator has been more conspicuous for its length than for its brilliancy. Once in a while some fellow Senator has had the temerity to say as much, though in severer terms. When one of them has thus ventured, the galleries have sat breathless, in expectation of seeing Penrose leap to his feet and strike back; but that is not his method. He remains silent in his seat, betraying no emotion, even by a change of countenance, while the speaker, goaded to a frenzy by this contemptuous attitude, goes on heaping accusation upon accusation till he has exhausted his stock. After the last word is said, Penrose rises, and, in the jargon of the Capitol, "proceeds to skin" his critic—not with the double-edged wit of a Root or with the prehistoric cleaver of a Tillman, but in a fashion all his own, quite as personal and strictly to the point. Not the least factor in the effectiveness of his retort is a peculiarity of pronunciation which some observers style a dialect. It is really more of an abnormal interplay of tongue, teeth, and lips—probably a trick acquired in childhood and left uncorrected—but by its very oddity it commands a fixedness of attention which the same listeners would not vouchsafe to the same things said by another speaker.

Penrose is a big fellow, reminding you of John L. Sullivan long enough out of training to have achieved a girth. His dark hair and moustache are too slightly tinged with gray to suggest his fifty-five years. With his heavy mouth, square jaw, the needlessly sinister expression of his face in repose, and the massive frame beneath, he impresses you as a merciless adversary to reckon with, whether in running a convention or directing a division of spoils. He made his last campaign for re-election against Gifford Pinchot, whom Col. Roosevelt had backed to win; but nobody in Washington who understood the ingrowing politics of Pennsylvania entertained a moment's doubt of the result, as between the two reformers.

For Penrose is a reformer, too. If you don't believe it, ask him. He doesn't shout overloudly for remote questions like the conservation of natural resources or the improvement of the foreign service; but when it comes to practical, every-day issues, look at his record! He not only condemns third terms for the Presidency, but he wouldn't have even two, and the one he concedes he would be willing to see reduced to a single year. As to extravagant expenditures, was not he the man who filibustered an appropriation bill out of existence because the Cabinet officer who would have the money to spend said it would be wasteful? Pensions? Why, a bill he fathered proposed pensioning not only all the soldiers of the Union army in the Civil War, but also all non-enlisted persons who were under military orders for thirty days during that crisis, with their widows, children, and dependent parents! He was an outspoken champion of the transfer of Senatorial elections from the mercenary control of the State legislatures to the purer atmosphere of the popular poll; and within a year we have found him quoted as favoring State laws for a graduated inheritance tax, the heavier taxation of Trusts, the regulation of women's and children's employment, strong public utilities commissions, and the submission of the question of woman suffrage to the voters. To cap all, he has declared it preposterous to allow "two or three men, sitting in a secret closet," to shape the fate of a political party. What more could any one ask? Has he not beaten Bill Flinn to a frazzle?

VIEILLARD.

Poets of the Day

Panama and Other Poems. By Stephen Phillips. New York: John Lane Co. $1.25 net.

A Boy's Will. By Robert Frost. New York: Henry Holt & Co. 75 cents net.

The Man on the Hilltop. By Arthur Davison Ficke. New York: Mitchell Kennerley. $1.25.

Verse. By Vance Thompson. New York: Mitchell Kennerley. $1 net.

Macterlinck's Poems. Translated by Bernard Miall. New York: Dodd, Mead & Co. $1.25.

Poems of Emile Verhaeren. Translated by Alma Stretteli. New York: John Lane Co. $1 net.

Japanese Lyrics. Translated by Lafcadio Hearn. The New Poetry Series. Boston: Houghton Mifflin Co. 75 cents net.

The themes in Mr. Phillips's latest volume of "narrative and occasional" poems are very old or very new; either they simmer, not to say reek, with modernity, or they lull us in the lap of ancient legends whose very turbulence is restful. The difference is pointed, but superficial. I think Ulysses could have severed Panama, and I am sure that Goethals would have found the narrow midcourse of safety between Scylla and Charybdis.

In his legendary monologues Mr. Phillips shows no decay of his old fondness for themes which literature has familiarized and domesticated, stories which ages have ripened and mellowed, most commonly under a Southern exposure. It is unlucky that in old-time themes one of his main traits and peculiar charms can be exercised only at the price of verisimilitude; I mean his fashion of using landscape as the refrain or under-note to character and situation, as in the "human ending to night-wind" audible to the childless Lucrezia, the sound of "all the rivers running to the sea" which solemnized the hour of temptation for Paolo and Francesca, or the "world of wearied passion dimly bright" which looked down from the languorous star on the unrest of Herod and Mariamne. Mr. Phillips cannot forego the luxury of such sentiments even when their expression is plainly anachronistic; and he goes much too far when he makes the shrewd Penelope lament that the return of Ulysses has deprived the surf and cloud, the dawn and the evening-star of the palpitant interest associated with the trembling hope of his arrival. The monologues and narratives are moderately interesting and reasonably poetical. "The Quest of Haidee," in ten diminutive cantos, is a sufficiently agreeable recital of the Eastern maiden's discovery and recovery of her English lover by a pilgrimage in which her only clue was the word "London."

The lovers of the timely will find compensation for these excursions in poems on Panama, pleading for justice as the privilege of America rather than the right of Britain; on Edward VII as peacemaker; on Tripoli in an anti-Italian sense; on "Red Rubber" (iniquities in the East); on the Balkan War; on wrongs of all grades, from the Kaiser's invasion of Belgium to the refusal of the Christmas breakfast egg to the poor children of the Lambeth Union. The cause is invariably righteous, and the attitude is usually indignant. If the wand which Nature and the Muses bestowed on Mr. Phillips is a bit too fragile to serve effectively as a cudgel, it is only fair to say that, though it rarely draws blood, it never snaps in his fingers. Rhetoric rather than poetry is conspicuous in these assaults, and its effectiveness is unquestionable in figures like the picture of Satan revisiting the earth in 1914, "And on his brow the thunder-scar unhealed"; or the touch that anathematizes the shirker:

> But though that orb may on an Empire set,
> Tomlinson lights another cigarette!

The execution of these poems is not impeccable. Fame or time has administered a sedative to conscience, and admission is found for prosaicisms, and, what is more serious, for hurried endings in which fatigue seems responsible for anticlimax. The verse is liquid, and of a real, though tenuous, melody. The fault of over-daring perversions or subversions of metrical regularity, which Mr. Archer once criticised in the pentameters of Mr. Phillips, is still discoverable, as in "And sudden lights of beautiful faces"; but is now so rare as to seem more like an assertion of prerogative than an indication of taste. Now and then we have a line of full-bodied music:

> Dawn broke in orange over lulling seas;

or one of imaginative vigor:

> The gray reminding rocks and floating gulls

or again a finely suggestive passage:

> Then as the dawn not yet appearing made
> A stillness in the world and one by one
> Bird upon bird awoke and dreamily
> Each to the other dimly felt for voice.

In Mr. Frost's "A Boy's Will" criticism detects three elements: first, vigorous landscapes sketched, or scooped out, with a bold, free hand; second, feeling of a certain trenchancy and distinction; and, third, superadded interpretations. Of these three constituents the last seems wholly perfunctory. Mr. Frost is a poet by endowment; he is a symbolist only by trade. The meaning he personally attaches to landscape seems quite unrelated to the meaning by which he hopes to enlist the sympathies of his readers. His philosophy, in a word, is propitiatory; it is Mr. Frost's apologetic bow to a supposedly intellectual public, and I am uncourtly enough to wish that the obeisance had been withheld. When Mr. Frost's intellectual revenues come in his verse will profit by the circumstance, but I doubt if it profits in the least by his anticipation of his income.

One point of detail unrelated to Mr. Frost's essential claims deserves a passing comment. Under the title of each poem in the table of contents a few words indicative of its purpose are set, and these phrases, read seriatim, make up a single coherent paragraph. This is an artifice, no doubt, but, in my opinion, a pardonable and commendable artifice; if poets will be locksmiths, they should furnish keys. I object personally to researches into obscure poetic meanings, not merely from the healthy human disinclination to overwork, but from a sense that the faculties which the assessing of probabilities and the summing up of evidence call into play are destructive of the moods in which poetry is absorbed and enjoyed. To extract, and so to separate, the soul from the body is surely the wrong way of approaching an art whose basis is the idea that the two are inseparable. Mr. Frost's expedient impresses me as sensible and considerate.

The real value of these poems lies in the quality of their emotion. Their tone is sombre, but it is that youthful sombreness which is little more than a play of hide-and-seek with cheerfulness. The definition of the feeling is not always sharp, but, even in its vagueness, it exhibits a savor, a saltiness, a reaching and penetrating quality, which augurs well for this young writer's future. I regret that Mr. Frost should think it desirable to exhibit in many places a crabbed syntax and a jolting metre. I am not consoled for these asperities by the probability that they are intentional, for I do not subscribe to the theory that in our day, when the Muses are lethargic, they must be jostled before they can be made to dance. I content myself with this gentle and modest imprecation: May Mr. Frost mount high on the slopes of Parnassus in a wagon without springs!

I quote two stanzas from "A Line-Storm Song":

> The line-storm clouds fly tattered and swift,
> The road is forlorn all day,
> Where a myriad snowy quartz stones lift,
> And the hoof-prints vanish away.
> The roadside flowers, too wet for the bee,
> Expend their bloom in vain.
> Come over the hills and far with me,
> And be my love in the rain.
>
> The birds have less to say for themselves,
> In the wood-world's torn despair
> Than now these numberless years the elves,
> Although they are no less there;
> All song of the winds is crushed like some
> Wild, easily shattered rose.
> Come, be my love in the wet woods; come,
> Where the boughs rain when it blows.

Mr. Arthur Ficke, justly praised a few months ago for a spirited volume of sonnets, returns to the charge with the promptitude, almost the precipitation, with which young poets respond to encouragement. I doubt if this celerity is encouraging to their reviewers. In the two narratives or "histories" that come first in "The Man on the Hill-Top," ability is manifest, but its effects are balked in the first poem by a quite unmanageable theme (a laboring man's literal self-crucifixion), and in the second by a superficial psychology in which egotism is mistaken for distinction and confusion for profundity.

In the group of diversified and ambitious

lyrics which follows there is more to interest, more to condemn, and more to admire. On the whole, there is greater finish and less power than in the "Sonnets of a Portrait-Painter." If those sonnets were intentionally *uncombed*, these later poems are sometimes suggestive of the curling-iron. The ode on Swinburne, in particular, is a model of virtuosity, but one cannot find a heart in a peruke.

Mr. Ficke feels called upon to condole with his friends for the pain which the necessity he is under of doing original and remarkable things may produce in their conservatism. The apology surely need not forestall the offence. I say this not in derision of Mr. Ficke—rather from a sense that the author of the "Sonnets of a Portrait-Painter" is too good a man to find occupation or even serious entertainment in watching the quiverings of his own shadow. He is keen enough to see the danger of anticlimax in solemn public leavetakings on the wharf when the avowed aim of the cruise is to bring back "the jewels of the sun."

Even romanticists and impressionists are mortal, and just as men in their unguarded moments show traits of their simian ancestry, so Mr. Ficke, whose progenitors were clearly men and women, has his hours of relapse into a human being. I quote the touching and truly poetical "Fathers and Sons" as a warning to Mr. Ficke's fellow-tribesmen of the fatal liability under which they stand of reversions to humanity and tenderness:

> Child to whom my loneliness
> Cries—and cries, I know, in vain,—
> Down the years I look and bless;
> Down the years let my hand press
> Strong your shoulder. I am fain
> You should reap from my sown pain
> Flowers of joy and loveliness,
> Child I love, and love in vain.
>
> You will never turn to me
> As I turn and cry to you,
> Regions strange and visions new
> Shall be yours to search and see.
> Old and alien I shall be.
> I who love you set you free.
> Yet recall I cried to you,
> Child I love so utterly.

The traits which I deprecate in Mr. Ficke I can tolerate much more readily in the author of "Verse." In Mr. Ficke they strike me as self-retrenchments; they appear to be self-fulfilments in Mr. Vance Thompson. There is something ultimate, I should hope terminal, in the idea of poetry reflected in this little volume which the pathology of literature could not willingly have let go. For Mr. Thompson, an artist has no responsibilities, no conscience, no purposes, no will; his business is to assume a recumbent posture and watch the exhalations, not to say the effluvia, of his own soul rise grandiosely into the firmament and mingle with their kindred nebulæ. The poems, in De Quincey's superb phrase, are "perishing dreams and the wrecks of forgotten deliriums." Mr. Thompson's idea of a rational and likable personality is a being who is half-ghost, half-satyr. If exercise becomes indispensable, one may walk up and down Broadway, watching the women of the street, in the company of the ghost of Edgar Poe:

> I walk in Broadway to and fro
> With the taciturn ghost of Edgar Poe.
> Girls idle for us where the lights
> Are red on the pavements there o' nights.
> Girls sidle with strenuous eyes for us,
> With gestures urgent and amorous.
> But we mock them, pacing to and fro—
> I and the ghost of Edgar Poe.
>
> "Dear ghost," I say to him, "to and fro
> As you walked in Broadway long ago
> Did the small girls idle for you and cry?"
> "Ho! the black stars swung in a yellow sky
> One night, one night—and a woman came
> Out of a harem of wind-blown fame;
> But the lips she laid on mine were snow—
> Bitter as ice," says the ghost of Poe.
>
> I make the sign of the cross.

The gift of translation, happily exhibited not long since by Mary Stewart in her free verse-renderings of Catullus, has descended upon Mr. Bernard Miall and Miss Alma Strettell in their English versions of the poems of Maeterlinck and Verhaeren. The poems of Maeterlinck, with their singular but far from ineffective union of lethargy and nightmare, their combined suggestion of hothouse and hospital, might have seemed destined to turn into drivel when they passed into English. But Mr. Bernard Miall at his best (even his worst is entirely respectable) retains their spirit, retains their rhythm, retains even whatever modicum of sanity is discoverable in the original French. This is good service, and entitles Mr. Miall to indulge a crotchet, and I shall therefore pass over his assertion in the preface that the "In Memoriam" stanza is a dull stanza, or rather no stanza at all, with the single comment that Mr. Miall's observations on prosody are certainly not "dull."

The originals of the poems of Verhaeren translated by Miss Alma Strettell are not immediately at my command, though I write in the library of the University of Chicago. Judged by their pure literary value, the poems here presented would rank creditably as English originals, which means, of course, that as translations their rank is very high.

The "Japanese Lyrics" in the "New Poetry Series" are dreamy ejaculations, meditative in spirit but concrete in form, rendered into English by Lafcadio Hearn with a touch that ranges from the deft to the exquisite. In English, fancy is associated with the gayety of the imagination; in Japan, if these scant pages are typical, it would seem to hold fellowship with melancholy. These lonely exclamations have a curiously double effect of concentration and of resigned aloofness, as if they were rifts in a stoicism which promptly closed over the temporary breach.

I welcome this increasing merit in translations. Translation, indeed, would seem to be almost the specific poetical function of an age which, in its relation to the makers of verse, is bountiful of accomplishments and frugal of inspirations.

O. W. Firkins.

Correspondence.

PUNIC FAITH.

To the Editor of The Nation:

Sir: In your editorial, July 22, on the Austrian note, which objects to the American sale of arms to the Allies, you quote Germany's declaration of December 15, which says that, "under the general principles of international law, no exception can be taken to neutral states letting war materials go to Germany's enemies." You say that Austria is a good ally for Germany, because she will do for Germany what she would not do for herself—for instance, send this note which Germany, because of her declaration, could not send. This seems to imply regard for reason and consistency on the part of Germany. You further strengthen this implication by saying that "it would be a bit awkward for (Germany) to repudiate (her) declaration now." But why should it be awkward? Has there ever been a time since she broke her faith, because it was "necessary," with Belgium, or, more recently, since she murdered our fellow-countrymen on the Lusitania, that she has hesitated, even for the sake of avoiding awkwardness, to repudiate her acts and words alike? Alfred M. Brooks.

Gloucester, Mass., July 30.

THE TYRANNY OF SCIENCE.

To the Editor of The Nation:

Sir: Few articles, since the beginning of the war, have furnished us with such inspiriting reading as is contained in Professor Babbitt's "The Breakdown of Internationalism." He sounds a much-needed call towards the virtues of concentration, of discipline, and of criticism. With this positive side of his philosophy many of us are in enthusiastic accord, and we shall do our best to work with him. But, because "right knowing is an indispensable preliminary" to right doing, as he himself says, it is our duty to criticise his interpretation of the past, to see whether he has called the devil by his right name, to discover whether the havoc in which we live is really due to humanitarianism.

He asserts that this type of warfare (mutual massacre) is "the final outcome of a propaganda for the establishment of universal brotherhood," a conclusion which I take leave to doubt, since it is at once too simple and too sophisticated. Too simple, since it implies that human brotherhood is finally indistinguishable from tigrine association; too sophisticated, since it implies that we can blame a current of ideas of the eighteenth century for all that is happening to us now. It is fatally easy to pick out some one doctrine that we personally detest, and label it the destroyer of virtue. In Professor Babbitt's vision of past history we seem to see a large, flat plain, in which armies of doctrines, some large, some small, lie intrenched and battling; a little coterie of disciplinary doctrines did well for a time, but they were overwhelmed in the period of the French Revolution by huge humanitarian squadrons, who insured their victory by the unscrupulous employment of poisonous gases.

Now, unless we can take an oath, and stick to it, unless we take a solemn vow never to allow theories precedence over facts, we are all likely to fall into such errors. It satisfies our inveterate love of abstractions to talk

about humanitarianism and expansionism; but it will hardly do to elevate them into the position of "causes of the war." We must employ sharper and hotter words. Man is the cause of this war—man's greed, man's folly, ably assisted by man's wisdom and man's unselfishness. This is not the time for us to curl up in a concentrated corner along with that infinitesimal minority, the "saving remnant," nor to discuss the possibility of "establishing peace in the breast of the individual." There is no peace in the breast of any save the dead.

But I do not wish to quarrel with Professor Babbitt over terms. I, too, am profoundly convinced that we may attribute this war to our neglect of humanism. I object only to his attempt to make humanitarianism the direct opposite of humanism. Suppose that we look, not at the French Revolution, but at ourselves; suppose that we directly and humbly assume a large part of the responsibility for this present hell, that we apply the acid-test, not to Rousseau, but to our own time. What were we doing just before the war? We were undeniably submerged in a vast epoch of science and industrialism, with Germany leading the field in both. We were all doing more or less the same things, but Germany was doing them more "efficiently" than the rest of us. Overnight the scene shifted from the laboratory and the factory to the trenches; and we have been so dazzled by the rapid change that we have not yet realized the one essential and appalling truth, namely, that the actors in the play remain absolutely the same as before.

Therefore we are all, including Americans, guilty in various degrees: Germany more and others less; but her guilt is due merely to the fact that she had gone farther along the same road. In her, then, we can study ourselves, not as we are, but as we soon may be. We are all awful examples, but she is the worst. If we can discover what Germany has done, we shall also discover what we have done; and we shall not be constantly hindered by our reluctance to discover any flaws in this great and beautiful neutral nation. In the first place, there is something visibly wrong about the German attitude towards science. I am not going to recount the mistakes her scientists have made, in so far as they are human errors to which we are all liable; but I am going to point out the huge mistake Germans have made about science, because that is an inhuman error. They are most damnably wrong in believing that scientific truth is all truth, in thinking that all human activity must be and can be controlled by science. Now that is not solely an intellectual error; it is a belief which has been fostered by all their passions, their greed for money and for power, their bestial love for dominion, and by pride in their unbroken material success of the last half-century. The result of this belief is inevitable: it leaves wholly out of account the other great aspect of human activity, the creative or poetic aspect, which is thereafter either mad and ungovernable or hopelessly aborted.

It will be easier to perceive the extent of the German aberration if we posit a single human being and study a living normal microcosm. What are the relations of such a man to science and to creation? Obviously a great part of his life will be spent in slavery to scientific "laws." He must eat in order to live; he cannot jump from a fourth-floor window without breaking his neck; he can never in the slightest degree disturb the uniformity of nature. Nature's laws are enforced upon him automatically. We have been much puffed up over man's conquest of Nature. Strictly speaking, man has by no means conquered Nature. He has only availed himself of his increasing knowledge of Nature's rules in order that he may obey them more perfectly and with more profit to himself. He cannot alter them, but he can learn more about them. From the human point of view, he is, therefore, in absolute subjection to scientific truth. If that were all, then the Germans would be quite right in deifying *Wissenschaft.* But it is not all, for there is another side of this human being's life wherein he is, comparatively speaking, free. He cannot alter scientific truth, but he can and does alter both himself and other human beings. He can make them angry or happy, wise or foolish; he makes, creates, poetizes, whether he be cobbler or Kaiser, gentleman or vagabond. There are not, and never can be, any scientific rules which will control his activity in this sphere of his life; nor any penalties automatically enforced. So long as he lives, he cannot help creating; he must, in this sense, be a poet, but he is free to be either a good or a bad poet. We have, then, two great aspects of human activity, which, taken together, make up a whole truth. They are reciprocally related, for each one limits the other. Neither can get along without the other. The scientist needs the poetic faculty in order to make new discoveries and to understand his fellow men; the poet, the creator, the statesman, need the scientific faculty in order that they may not attempt the physically impossible. In the genuine human being, both faculties are combined in their due measure.

But in the Germans they are not combined in due measure. The Germans have spent decades in passionately persuading themselves that not only some things, but all things, can be done by science. They have tried to reduce the universe to the status of a scientific mechanism; they have tried to explain religion, art, literature, history, morality, and every branch of human creative activity, by science, and nothing but science. Nature functions like a perfect machine, and so the Germans have set out to make themselves into perfect machines. They are efficient, like machines; they are organized, like machines; they are disciplined and obedient, like machines. That is, they are all right scientifically. But when we come to observe their recent displays of creative activity, of poetry, of insight and imagination, what do we find them doing? They rape Belgium, they sack Northern France, they sink the Lusitania, they write the "Song of Hate," and their intellectuals issue reeking manifestoes. They are all wrong creatively. Their attempt to make scientific machines out of themselves has not been a complete success. It could not be. They have merely succeeded in directing their creative powers into the channels of insanity and death.

That is why I have called the Germans an awful example. We do well to be sober as we contemplate them, for we are beholding the logical results of sins which we are ourselves committing every day. Our business, our industries, of which we are so proud, are no more than a low but necessary form of scientific activity. Yet every American who is inclined to think that commercial prosperity is the whole truth which we must strive to attain, who thinks that efficiency will solve all our difficulties and finally usher us into the millennium, is really preparing a German hell for us over here. In order to live decently and humanly, we must be not only scientists but poets. We are daily facing novel situations and meeting dangers which we have never met before. Most important of all is the fact that there are no rules which we can look up, no handbooks of the complete science of life, for the simple reason that there is no science of life. We have to create, to adapt ourselves, to employ our imaginations, whether we will or no. The Germans are quite sufficient proof that human beings cannot succeed by virtue of science alone.

Perhaps a good many of us believe all these things I have been saying. If so, we must do something about it; we must convert our belief into action. It is precisely in this delicate matter of making a positive recommendation that we need the greatest clarity of thought. I agree with Professor Babbitt that we need discipline and criticism. But if my imperfect analysis has been even partially correct, we need far more than that, or, rather, we must extend the meaning ordinarily attached to those terms. We need that kind of discipline which will not sterilize or weaken our creative activity, but which will rather enhance it and guide it towards right action; that kind of criticism which amounts to re-creation. Our education must be neither exclusively scientific nor exclusively poetic; the attempt to be all one or all the other leads straight to insanity and straight away from humanity. At present the training given by our schools and colleges is almost wholly scientific. It makes no difference what "courses" a student takes; whether the subject be English, French, or chemistry, they are all treated in the same way as bodies of objective fact and fragments of the greater corpus of scientific knowledge. We have frequently joked about it, but the war should teach us that it is not a joke, but a very real peril to the country. So far from advocating inspirational or snap courses, we ought to tell our students that, no matter how hard they work at science, they must work harder still at literature.

"You must know enough scientific truth," we may say to them, "to be able to handle objective facts. You must learn so much about the laws of nature that you will be able to control your physical existence properly, to build a bridge or to make an engine, or whatever scientific work your profession summons you to do. But when you have accomplished that much, your task is only begun. You need to know men, to imagine, to invent, to become a creator. Otherwise you will be a mere mechanical beast, like the Prussians. Therefore, you must study great literature. You will find it taxes all your powers, if you go at it in the right way. For you must not only learn the necessary scientific facts about the literature, but you must do what is infinitely harder—you must sweat and struggle with your small gift of imagination and insight until somehow or other you shall live over again in yourself the joy and torture which attended the creative vision of the poet you are reading. That is a man's work. If you accomplish it at all, you may make both yourself and the world a little better."

Instead, therefore, of cursing democracy, muckrakers, and humanitarians, I propose that we curse nobody but our sinful selves. The legalism from which we suffer, the "pass-

another-law" state of mind, is not due to the existence of muckrakers. It is directly due to our idiotic attempts to control human life by laws falsely analogous to the laws of science. Our greed has been so stimulated and our imagination so stunned by the appalling growth of scientific industrialism that we have tried to make all humanity over upon a scientific bed of Procrustes. We cannot afford to wait long for Theseus.

R. K. HACK.

Cambridge, Mass., June 28.

SUGGESTIO VERI.

TO THE EDITOR OF THE NATION:

SIR: It seems to me that in the article "Chautauqua and Water" in the *Nation* of August 5, you overlooked a point—one which makes Mr. Adams appear in the light of a sharper.

I know a good deal about Western audiences, and I will wager that a large number of Mr. Adams's hearers were chewing "Spearmint gum" during his lecture.

Consequently any one who wasn't himself or herself indulging in that pastime, and whose olfactory organs were normal, could have smelt peppermint anywhere in the room without "suggestion."

Mr. Adams probably knew this, and selected peppermint for that reason. Had he chosen some other scent results might not have been so satisfactory. JAMES R. LATIMER.

Chicago, August 7.

AN ANCIENT AND HONORABLE PUBLISHING HOUSE.

TO THE EDITOR OF THE NATION:

SIR: I have found nothing more interesting in your valuable anniversary number than Mr. George Haven Putnam's review of the American publishing houses for the last half century. There are few men now connected with the trade who could have brought together so much information on the subject with such a high degree of accuracy, but the *Nation* has taught its readers that no one (editors of course excepted) is omniscient. Mr. Lowell—was it not?—after reading the early numbers of the paper, cautioned his friend, "My dear Godkin, avoid omniscience," and I observe that with all Mr. Putnam's endeavors for thoroughness he has passed over the one American publishing house which has maintained a continuous existence for 126 years, and which has been established in New York city for more than a century, though the identity of the Methodist Book Concern has sometimes suffered from the former practice of using the names of the transitory "Publishing Agents" in its imprint instead of its corporate title.

The Concern was founded by the action of a Methodist Conference, meeting in the John Street Church in this city, in 1789. Philadelphia was its place of business until 1804, when it opened a salesroom in Gold Street, moving thence to Pearl, to Church, to Elm, to Chatham Square, to Fulton, to Crosby, and in 1833 to Mulberry Street, where its printing office was for a time one of the sights of the city. It continued to manufacture books and print religious periodicals there until 1890, when, with the offices and salesroom which had been for twenty years at 805 Broadway, the business was consolidated in the structure erected for it at 150 Fifth Avenue, corner of 20th Street, where it has since been carried on. It started in business on a (borrowed) capital of $600, which has grown to $6,000,000. For the last quarter of a century it has distributed more than $100,000 a year in pensions to what Methodists still commonly call "wornout preachers."

Incidentally, permit me to add that this house of honorable history has received at the Panama Pacific International Exposition at San Francisco a Grand Prize, the highest award given by the Exposition, for the printing and binding of books and general bookmaking. JAMES R. JOY.

New York, August 10.

Literature

A TRIUMPH OF AMERICAN SCIENCE.

Sanitation in Panama. By William Crawford Gorgas. New York: D. Appleton & Co. $2 net.

It is now generally recognized that an important factor in the successful completion of the Panama Canal—a factor which insured success for the American effort where the French effort failed—was the control of the tropical and subtropical diseases which had in the past given the Canal Zone the reputation of being the most unhealthy spot on the face of the earth. It is also generally recognized that to Gorgas and his associates belongs the credit of this great triumph; but few persons are familiar with the scientific discoveries which preceded Gen. Gorgas's work and made it possible, or with the details of his practical application of these discoveries in the establishment of a rational sanitation.

Throughout this volume one is impressed with the modesty of Gen. Gorgas concerning his own work, and the care which he takes to give credit to those who preceded him, especially those who established the theory of the transmission of yellow fever by the mosquito. In this story, which deals with one of the greatest triumphs of American medicine, Gorgas details the views of Dr. Carlos Finlay, of Havana, who believed that the mosquito was concerned in the transmission of yellow fever, but could not prove it, and also the observation of Dr. H. R. Carter, of the Public Health Service, which indicated that infection was not due to immediate contact. Then he takes up the observations of the United States Army Board—that famous and immortal board composed of Reed, Lazear, Carroll, and Agramonte—which finally and definitely established that yellow fever is transmitted by the bite of the female stegomyia mosquito; that this mosquito, to become infected, must suck the blood of a yellow-fever patient within the first three days of his disease, and that, after hiting an infected person, twelve to twenty days must clapse before the mosquito herself is ahle to transmit the disease. These are the simple, plain facts upon which Gorgas later was to rear his practical system of sanitation by which Havana and Panama were rid of yellow fever; but one must read Gorgas's account to appreciate fully the unflagging labors, the acme of scientific reasoning, and the heroism of this Army Board—of Lazear and Carroll volunteering to bare their arms to the bite of infected mosquitoes, and of Lazear succumbing to the resultant disease, and thus giving his life to demonstrate a scientific theory, while Carroll died several years later from the undermining of his health, due in all probability to that earlier infection; of other volunteers sleeping in and using the soiled clothing of those dying from yellow fever, in order to demonstrate that infection could not be transmitted by contact with the discharges of the yellow-fever patient, but only by the bite of the mosquito. No more glorious work was ever done by any army in time of peace or war, and with Gorgas's later application of the scientific facts thus gained, the control of yellow fever did much to atone for the poor showing of the sanitary department of the United States Army in the Spanish-American War.

Gorgas had immediately an opportunity to apply these principles in Havana, to which place he had gone two years hefore (1898) as head of the Sanitary Department. Yellow fever had been endemic in Havana since 1762, and, thinking it a disease due to filth, Gorgas had believed that if he could clean Havana yellow fever would disappear. By 1900 Havana had been cleaned. As Gen. Gorgas says, "Havana was cleaner than any other city had ever been up to that time," but, despite this, yellow fever not only was not under control, but was increasing, and in 1900 the incidence of the disease was greater than for several years. About this time Gorgas, who had been in close touch with the Army Board, began a practical campaign against the mosquito. This was based on the fact that a mosquito, to become infected, must bite a patient within the first three days of the disease. All persons with yellow fever were quarantined in screened wards; the house in which the patient had been sick and contiguous houses were fumigated with such material as would kill mosquitoes, and the breeding of mosquitoes (in water) was prevented. The same precautions as regards quarantine and fumigation were applied to incoming ships. The result was amazing. A city of 250,000 people in which yellow fever had existed for 200 years, and which for ten years previous had had an average of over 500 deaths a year from this disease (in 1900, the year before the campaign against mosquitoes was started, 310 deaths) was in eight months free of the disease. Not only this, but deaths from malaria decreased rapidly, and in a few years this disease also disappeared almost entirely. Indeed, in September, 1901, so heneficial had been Gorgas's sanitation that the deaths in Havana from all causes were only 359, a rate of 15.64 per cent. per thousand. It was in this connection that Gorgas wrote Reed: "I am getting so that I am afraid to go back to the United States and run the risk of infection and bad hygiene that you are constantly sub-

jected to in cities such as Washington, New York, etc."

It is not surprising that, with this experience and with this record behind him, Gorgas was appointed, in 1904, Chief Sanitary Officer for the Isthmus.

Here the immediate and most important problem, aside from preliminary organization, was, as in Havana, the control of yellow fever. The French had lost yearly from the disease one-third of their white force. If the same ratio held under the new régime, as was to be expected among the non-immune Americans, thirty-five hundred deaths annually were to be feared. Such a death-rate would mean not only great difficulty in keeping Americans at Panama, and necessarily a great increase in wages, but, even if these difficulties could be overcome, it was doubtful if Congress would sanction the loss by yellow fever of two to three thousand Americans yearly.

As a result of experience in Havana, destruction of the mosquitoes by fumigation therefore became the first order of business in the Canal Zone, but on a scale never before attempted. Instead of only houses in which yellow fever occurred being dealt with, the entire city of Panama, with 20,000 inhabitants, was fumigated. Starting at one end of the city, the corps went through every house. This took a month, and as some cases of yellow fever still occurred, the procedure was repeated a second time; still other cases of yellow fever occurred, and a third fumigation of the entire town followed. The magnitude of this wholesale destruction of mosquitoes is shown by the fact that in the course of a year the entire supply of insect powder of the United States, 120 tons, and 300 tons of sulphur were used.

But all this was not done without great opposition. Gorgas was subordinate to the Governor of the Canal, and could reach the chairman of the Commission only through him. The Sanitary Department was hampered in its work, yellow fever continued, and the rank and file of the men began to believe that they were doomed, as had been the French before them. Matters came to a head when the Governor and the Chief Engineer recommended to the Secretary of War that Dr. Gorgas and those who believed in the mosquito theory be removed and that men with more practical views be appointed in their stead. Fortunately for the early and successful completion of the canal, the prestige of the United States, and the cause of sanitation the world over, the President of the United States was familiar with what had been done in Havana, believed that the mosquito theory had been established, and not only declined to sanction the change recommended, but directed that every possible support and assistance be extended to the sanitary officers.

This must be considered one of Roosevelt's most important decisions, for within six months Gorgas was able to clean up both Panama and Colon, the two principal foci of yellow-fever infection at either end of the railway, and in November, 1905, the last case of this disease occurred in Panama. A single case occurred in Colon in May, 1906, but during the eight years following not one case originated on the Isthmus. This result quieted alarm in the region and gave the sanitary officials great prestige, not only among the employees of the canal, but also among the natives, and thus assured their ready coöperation in later sanitary efforts. No wonder the people of the United States are proud of the conquest of yellow fever as a work inaugurated and completed by officers of the Federal Government—the scientific basis of the mosquito theory established by an Army Board, the practical application of this theory, worked out in Havana by an army sanitary officer, its further application assured in Panama by the decision of a wise and far-seeing President, and the final eradication of disease from this, the unhealthiest spot in the world, again the work of army sanitarians. The canal would probably have been completed without the triumphs which Gorgas worked, but with what a loss of time, of money, and of lives. Humanity owes a debt indeed to that first Army Board and its heroic members.

Although yellow fever was the fundamental problem of sanitation in the Canal Zone, it was not the only problem. As Gorgas states, the most important pioneer work was done in 1905 and 1906, and by the autumn of 1907 it was a question of holding what had been gained. Malaria received almost as much attention as yellow fever, and the campaign taken up in earnest after the control of yellow fever involved an area fifty miles long and about two miles broad. Other special problems were those concerning lepers and the insane and quarantine against bubonic plague. More general problems related to hospital management, sanitation for the convalescent, and matters of quarantine. The methods of meeting all these problems Gorgas gives in detail. Here may be presented the general result. The average force on the Isthmus during ten years was 39,000 men. The average sick-rate was 23 men per thousand per day, as contrasted with an estimate of 333 per thousand during the French occupation. The death-rate for ten years was 17 per thousand for each year, as contrasted with 200 per thousand during the period of French control. It is this death-rate, lower than that of many of our northern cities, that constitutes a most important by-product of this country's activities in the Canal Zone; namely, the demonstration that proper sanitation guarantees a healthy life in the tropics, and may be the means of throwing open to settlement large areas of the earth's surface, now non-productive.

It is not to be inferred, because the reviewer has followed the main scientific theme—yellow fever—of Gen. Gorgas's account, that the book is a dry recital of matter pertaining to tropical diseases and health in the tropics. On the contrary, the author has introduced many interesting accounts of the early history of Havana and Panama, much of which reads like romance, and numerous personal experiences, sometimes humorous, sometimes tragic—all of which make an exceedingly readable story of what must be considered as an epoch-making achievement in American history.

CURRENT FICTION.

The Indiscreet Letter. By Eleanor Hallowell Abbott. New York: The Century Co.

As what may be termed an American magazine masterpiece, this little story deserves notice. It has the jauntiness, the briskness, the superficial touches of modern daring, and the underlying world-old sentimentalism; the damsel-errant motive, now so popular, and the chivalrous-drummer motive, hardly less so. The damsel is of high degree, according to her author, though she talks, as it happens, rather like a vivacious stenographer on an outing. In short, it has precisely that inherent commonplaceness plus the fillip of novelty in setting and detail, which constitutes the much-vaunted "punch" of literary and dramatic commerce. Hence its republication in book form of the dainty decorated pale-blue border kind. "Summer reading," of course.

The House of Many Mirrors. By Violet Hunt. New York: Brentano's.

A novelist of twenty years' experience, this writer acquired early something of the sophisticated manner which Mr. James has made both sublime and ridiculous. It is a little old-fashioned by now: give us something brisker, franker, simpler, something neither Victorian nor consciously non-Victorian, but our own. Here are the sophisticated air, the hints and hedgings and implications, the avoidance of plain speaking. It is possible to conceal a good deal of emptiness, among other things, beneath this manner. A sufficiently clever performer can give the desired flavor to mere sawdust and ashes. For a good part of his way through this book the reader may well be uncertain as to whether he is reading about anything or not. We seem to be pottering inefficiently with certain ancient materials such as a hero of the artistic temperament, a terrible old man with a fortune, a family row about a possible inheritance, and so on. As for the wife of the temperamental gentleman, she comes very near being a bore with her solicitudes. But for fifty pages at the end the story becomes forthright and intelligible, poignant in its way. That Alfy may inherit his heart's desire, Rosamond, about to die, not only conceals her condition, not only steals away to die alone, but contrives a further sacrifice by writing a long series of letters to be forwarded to him at regular intervals after her death. By this means Alfy is kept at his post, that is to say, at the bedside of the dying rich uncle. There, too, is a young female cousin who, against

her own interests, plots for Alfy. The end of the story is full of ironics. Rosamond's bequeathed letters have been written in desperation and are not up to the mark of Alfy's theory of his wife. His gradual estrangement from her is paralleled rather than caused by a creeping intimacy with the young cousin Emily. The old man dies, and it turns out that a will of twenty-five years standing is in favor of Alfy. Rosamond's sacrifice has been unnecessary. Emily is more or less stranded, and Alfy decides to take her to Rosamond. On the journey, seeing a long life of impossible self-suppression before them, they succumb to the temptation of the moment. At the end of the journey the truth about poor Rosamond, six weeks dead, sufficiently avenges her.

The Sea-Hawk. By Rafael Sabatini. Philadelphia: J. B. Lippincott Co.

A gadzooks romance with a generous measure of blood, revenge, sacrifice, villany, adventure, and heart-interest. For the reader who does not find improbability dull, it will be guilty of no dull moment; and if you like a fustian style, here is your article. Two brothers, one seeming-virtuous but really vile, the other a wild blade with the heart of a saint—we have met these gentry before. The young hypocrite (Lionel) is guilty of a deed of blood which the old blade (Sir Oliver) might have done. Sir Oliver takes the blame; but Lionel does not trust him, and has him kidnapped, on the pleasant understanding that he is to be sold in Africa as a galley-slave. The lovely and high-born maiden who has provisionally given her heart to Sir Oliver, believes all against him, and Sir Oliver is duly carried off, but by fortune and merit presently becomes Sakr-el-Bahr, the Sea-Hawk, champion and chief corsair of Islam. After a season he returns in a captured Spanish galleon to England and abducts Brother Lionel and the maiden, now Brother Lionel's betrothed. Then there are all kinds of doings, involving the appearance of Lionel and maiden in an Oriental slave market, perils for both on land and sea, their rescue by the Sea-Hawk, and the eventual vindication of that gentleman. Now all this material is good enough of its kind. Our quarrel with this sort of book—and we have read ten like it within a year or two—is that the material is woodenly and perfunctorily employed. Is the special audience at which costume romance is aimed so dull as to make an author's pains wasted? A century after Walter Scott, can his successor in the big wow-wow strain afford to be so hopelessly and, as it were, brazenly his inferior in historical accuracy, in human portraiture, in style? The truth may be rather that Sir Walter was too good for his audience than that these yarn-spinners are too bad for theirs. For his audience was youth or the spirit of youth, and if there is any absurdity of matter or manner which that audience is not prepared to swallow in the name of romance, history doth not record it.

INDUSTRIAL RUSSIA.

An Economic History of Russia. By James Mavor. New York: E. P. Dutton & Co. Two vols. $10.

Since Mackenzie Wallace published his classic "Russia" nearly forty years ago no English writer has essayed so comprehensive and considerable a survey of economic conditions in Russia as the author of these two substantial volumes. Like Wallace, Professor Mavor knows Russian, and acquired some of his material from first-hand observation on the spot. But by far the greater part of his work is based on the researches of recent Russian investigators; so that, while Wallace always has the freshness of the steppes and village life, Professor Mavor's work suggests the scholar's study and midnight oil. Where Wallace was content to describe discursively as a traveller, Professor Mavor proceeds to formal analysis and to philosophic or socialistic interpretation. Wallace gives a cross-section of Russia in the second half of the nineteenth century. Mavor describes the growing current of economic life (and to a large extent of political and constitutional life also) from the dim past, when the Slavs were but a name, down to the meeting of the Duma in the twentieth century. The two authors are complementary. The one is as indispensable as the other to any person who would get some solid knowledge of the great unknown land of unlimited possibilities.

Professor Mavor's point of view is that of the toiler—the tiller of the soil and the proletariat of the factory. His sympathy is not with the autocracy and its police, however well-meant their efforts have been. At times he leans quite heavily on one-sided revolutionary sources and on the writings of Russian exiles like the gentle anarchist, Kropotkin; but as he always cites his authorities carefully, it is easy for the reader to check up his statements.

In the first part of the first volume the author describes the early Slavs, the consolidation of the Russian state under the Muscovite princes, the gradual degradation of the peasants into serfs (not effected as commonly stated by Boris Godunov in 1597), and the rise and decline of the Russian Estates General, or Zemsky Sobor, in the seventeenth century. In all this Professor Mavor wisely follows the sure guidance of Kluchevsky's excellent "History of Russia." Though the first volumes of this have since been translated into English, students will find that Professor Mavor often gives a clearer idea of what Kluchevsky is saying than does the translator, for the former at any rate is acquainted with somewhat analogous institutions in feudal Europe. But even so, his pages about *kholopi*, "*kabala* men," "votchinal ownership," and *tyaglo* are fairly difficult reading. The agrarian history is particularly difficult to follow because the author does not consistently adhere to one terminology: "peasant," "bondsman," and "serf" are apparently all used at different times to mean the same thing.

But with the appearance of Peter the Great, the reader's perplexities disappear. He can enjoy a clear and enthusiastic account of that ruler's extraordinary military, fiscal, commercial, and industrial reforms. To raise the funds for the army and navy, Peter resorted to an inconceivable jumble of taxes, "an excise upon hats, boots, and skins, taxes upon inns, upon rented houses, upon cellars, chimneys, baths, water, and upon loading and discharging lumber, upon the sale of food in general, and in particular upon watermelons, cucumbers, and nuts" (I, 133). Beards might be worn, but they were taxed, for a nobleman's beard sixty rubles, for a merchant's eighty, and for a serf's thirty. Taxes also were paid at birth and at marriage, though by a strange oversight the tax-inventors omitted an impost on funerals.

More than two-thirds of the first volume deals with the century and a half from Peter the Great's death down to the next important landmark in the economic history of Russia, the "fall of bondage right," *i. e.*, the emancipation of the serfs in 1861. Professor Mavor has much that is new and valuable to say in regard to the various classes of agricultural serfs, the influence of the Slavophils and of writers like Turgeniev and Chernishevsky, the growing conviction of the evils of serfdom, and the long labors of the numerous committees which finally accomplished emancipation. He makes very plain the tremendous opposition that had to be overcome, but he does not make sufficiently clear and detailed the purely economic results of emancipation. One expects to find these results analyzed in the second volume, but on opening it one sees that the author's interest has shifted to another matter—to the conflict between autocracy and revolution.

The first great revolutionary movement in Russia, according to the author, was "The Rising of Pugachev," in the latter part of the eighteenth century. Though commonly regarded as an agrarian movement, Professor Mavor believes it to have been largely industrial in its origin, being due to the social dislocations caused by Peter the Great's frantic efforts to establish manufactures. Thousands of serfs, instead of being *adscripti glebæ*, were ascribed to the factories and mining concerns run by the State or by private nobles. It was largely these industrial serfs, in southeast Russia and in the Western Urals, who swelled Pugachev's following and enabled him to defy the armies of autocracy for more than two years. The next revolution, the half-baked "Decabrist" affair of 1825, was, on the contrary, largely military; it was due to French ideas fermenting in the heads of Russians who had campaigned on the soil of France in 1814-15; but it was sharply nipped in the bud by the personal bravery of Nicholas I. It was only after emancipation, and largely because of the social dislocations caused by it, that the "revolutionary state of mind" began to be deep and widespread in Russia.

It was furthered enormously by three factors: the "western" and socialistic propaganda of the intellectuals of the seventies and eighties, the inefficiency of the autocracy both at home and abroad, and the inevitable disturbing effects of the growth of capitalistic industry.

All these factors and their complicated interrelations are clearly and excellently described by Professor Mavor. They will doubtless be found by most persons to be the most interesting part of his volumes. They centre upon personalities who are audacious, sinister, and mysterious, and they blaze forth in assassination of the police and by the police. Professor Mavor does not indulge in rhetoric, but gives us the cold facts of Khalturin sleeping with dynamite under his pillow, of Zubatov and Azev playing the perilous double rôle of police spy and labor agitator, and of Father Gapon driven against his will from an economic into a political agitation which resulted in "Bloody Sunday." After analyzing in detail the series of strikes in 1905 by which revolution triumphed over absolutism, the author speaks briefly of the reaction which followed, but closes with a note of hopefulness:

> Russia has changed abruptly from a country in which criticism was sternly suppressed to one in which criticism abounds. The Duma, with all its defects, has become a school in which a new generation of competent rulers may be trained. Without some such school as this—outside of the bureaucratic field—it would be impossible for Russia to aim towards an effective democracy.

THE SOCIALISTIC DIASPORA.

The Socialists and the War. By William English Walling. New York: Henry Holt & Co. $1.50 net.

In promptly collecting and publishing the official statements of the Socialist parties and the record of their acts since the outbreak of the war, Mr. Walling has rendered good service to all those who are interested in the Socialist movement. His book has the especial merit of being strictly a record of facts and documents. He has studiously refrained from argument and from all comment other than the barest minimum of necessary explanation. While this makes his book rather difficult reading for one who is not at least moderately well versed in the minutiæ of Socialist politics, it notably enhances its value as a collection of references.

The common notion that the outbreak of war in Europe last August cut well below the lines of division most deeply etched in the social fabric of the belligerent countries is certainly correct so far as Socialism is concerned. In the countries affected the Socialists went to the colors and the "International" collapsed at the first shock of conflict. In November, 1914, Karl Kautsky (commonly regarded as the leading Socialist writer of the day) wrote in his paper, *Die Neue Zeit*, as follows:

> So the present war shows the limits of the power of the International. We deceived ourselves if we expected that it might assure an harmonious attitude of the whole Socialist proletariat of the world during the world war. Such a position was possible only in a few specially simple cases. The world war split the Socialists into various national camps. The International is unable to prevent that. That is to say, it is no effective tool in war. It is essentially an instrument of peace (p. 231).

In France and Belgium Socialists were invited to join the Government, and accepted. No such invitation, however, was given in Germany or Austria. In Germany the party, after violent dissensions in caucus, supported the Government on the ground that it was a "defensive" war. The Austrian Socialists took virtually the same course. It was asserted by Haase in the Reichstag that the international labor movement has "at all times recognized the right of every people to national independence and national defence, and at the same time we condemn all war for conquest" (p. 144). The Russian Socialists of the Duma, fourteen in number, however, declined to vote the war credit in August and declared themselves opposed to the war. Italian Socialists, while declaring opposition to war, showed great bitterness against the Teutonic allies. Two of the three Socialist organizations in Britain aligned themselves with the Government at the outbreak of war, and the third divided about equally on the question a little later.

That the downfall of the International at touch of the sword proves much against the future of Socialism may reasonably be doubted. As Mr. Walling says, in his opening chapter:

> The general public felt greater confidence in the Socialists' powers than the Socialists themselves had ever felt. When they failed to live up to public expectation a part of the public believed that Socialism was bankrupt. But a far larger part showed greater interest than ever. The Socialists at least had done all in their power to prevent the war from breaking out. It is true that the governments participating also claim to have tried to prevent the war. But while the sincerity of some or of all the governments is widely questioned almost nobody has the slightest doubt as to the sincerity of the Socialists (pp. 3-4).

The truth is, probably, as Kautsky said, that war is stronger than Internationalism in its present stage of development, but war will not last forever, and Socialism may, at least conceivably, exist on a large scale before real internationalism comes into being. The casuists of the Socialist parties, Bauer, for example (p. 20), can make a place for war in the Socialist scheme while things are as they are—nor is their reasoning unsound.

It is only natural, however, that we should find the Socialists in the warring nations leading in the efforts—such as those efforts are—for peace. The German Socialists (and those of Austria-Hungary) have developed a very strong minority which takes the ground that the purposes of a "defensive" war have already been accomplished and that it is time to cease fighting, without attempt at aggrandizement of territory. Probably half the parties of German-speaking nations take this view, which is openly expressed by *Vorwärts* to the limit allowed by the censorship. Socialists in neutral nations are, of course, in the main, for peace, although very divergent views as to the nature of the peace to be made are found to exist. In France, England, and Italy the pacifist proportion among Socialists is very much smaller than in Germany and Austria. The French Socialists seem to be almost unanimous for a fight to the end. A conference of Socialists in "Allied" nations in February endorsed the war as necessary to break German imperialism.

AMERICA AND JAPAN.

America to Japan: A Symposium of Papers by Representative Citizens of the United States on the Relations Between Japan and America and on the Common Interests of the Two Countries. Edited by Lindsay Russell. New York: G. P. Putnam's Sons. $1.25 net.

The symposium of papers by Japanese writers of distinction, entitled "Japan to America," to which the present volume is a response, was reviewed in these columns a few months ago. As the various contributions had been prepared for publication before the outbreak of the great war, this disturbing element did not enter in any way into the discussion. It was impossible for contributors to the later volume to ignore the subject altogether, although many of them have weakened their appeal by needless avoidance of its logical bearings on the situation to-day. But for Dr. Charles W. Eliot's manly and outspoken approval of "the effective execution by Japan of its treaty with Great Britain," it would be difficult for a reader of "America to Japan" to gather from its pages that Japan was and is at war, and on the side of the Allies. In fact, the language of some of the contributors might fairly be held to imply the contrary. "We of Japan and America," declares Mr. Darwin P. Kingsley, at the close of a paper entitled "Human Brotherhood," must unite to slay its (war's) artificial monsters, to banish its unnatural terrors. Otherwise sovereignty will go on quarrelling with sovereignty, and so forth. This endeavor to separate our aims and ideals from those of the Allies, when the danger to Japan lies in the imperial and militaristic character of her Constitution, spoils much of the argument. Only one of the papers is from a Japanese pen, that by Prof. T. Iyenaga, lecturer on political science in the University of Chicago, and he makes it patent that he regards American friendship as incomplete without English partnership. He is glad that "an ever-increasing number of his fellow-countrymen not only understand the English language, but are capable of interpreting to their compatriots the spirit of Anglo-American civilization." To insure the future development of Japan, it is imperative that she preserve and strengthen her friendship with both the great English-speaking peoples, and gradually substitute their representative institutions for her present imperialism. If they treat her unfairly or trifle with her legitimate demands, she will surely drift

into a militaristic policy. Hence there is nothing more dangerous or unpatriotic than to make Japan a pawn in our domestic politics.

At present Japan is proud to be the trusted ally of Great Britain, and wise Americans, in touching on international topics, would do well to remember this fact. The *Japan Mail*, which for many years did good service in placing the Japanese case before the world, and in smoothing the relations between Orient and Occident, was conducted by an Englishman, but some of his ablest henchmen were Americans, and the journal stood for Anglo-American good-will. There was the same united action in the Asiatic Society of Japan at Tokio, where presidents and secretaries were alternately British or American. The Protestant missions of both countries have also coöperated in their work. The absence throughout the volume of any proper appreciation of this relationship is a distinct and regrettable weakness.

Nor can we address Japan, as do several of the contributors, as if this country were altogether free from the imputation of adding to its possessions by successful wars. Our Mexican War of sixty years ago, followed by a huge accession of territory, is hard to justify; our Spanish War of 1908 resulted in the capture of the Philippines, and we became, like Britain, France, and Holland, an Asiatic Power holding our possessions by military force; and the obtaining of the land needed for constructing the Panama Canal and securing a foothold on the Isthmus was a high-handed piece of diplomacy which has made Colombia our bitter enemy and requires warships and fortifications to back it up. Justify as we may to our own satisfaction the acquisition by purchase and conquest of the Philippines, yet it marked so complete a change in our foreign policy as to lead at once to a less trustful attitude on the part of Japan. As it was followed soon after by the Californian trouble, this country had to take thenceforth the second place in the regard of the Japanese people, the first place going to Great Britain. Before that time we stood easily first. There is no hint in the symposium of this shifting of sympathies.

President Benjamin Ide Wheeler stands almost alone among the contributors in his attitude towards the recent anti-alien legislation at Sacramento. He denies that this legislation is directed against the Japanese as a people, and defends Californians as practical Americans, who have arrived at the most sensible view regarding the problems involved in the contact of East and West. He thinks that "other Americans, as fast as they come to a full understanding of the situation, will take the same view." Later on in the article he expresses surprise—and wisely—at the scant attention paid to Dr. Gulick's proposal, "which admits from any land, Asiatic or European, a certain fixed percentage of those from the same land who are already naturalized Americans. This proposal has the double merit of avoiding a sudden change in the proportion of immigrants from different countries and of treating all on the same basis." Politicians would do well to take the hint. While some of the papers are marked by a patronizing self-complacency, others err on the side of flattery. Thus Mr. Larz Anderson, ex-Ambassador to Japan, finds Japan a "Wonderland," which revealed each time he saw it "the same great national traits that are among the finest which have been granted to mankind, and which flash out now and then, even in these modern material days, in some splendid act of self-sacrifice or heroism, of loyalty to Emperor, to country, to family, to tradition, which is so fine, but now, alas! so out of date in the rest of the world that it is scarcely understood or appreciated." What of the wonderful devotion the German people are showing to Emperor and Fatherland, or the extraordinary spontaneous loyalty of the colonies to the British Empire, or the heroism of little Belgium?

The same false note is struck in Mr. George Kennan's "What the West Might Learn from Japan." He comments on the numerous evidences of Japanese chivalry and courtesy shown towards their enemies in Manchuria: the monument erected to the Russian soldiers who perished at Port Arthur; the memorial crosses put up over the graves of Russians who died between Liao-yang and Mukden; the honor paid to the brave Russian spy, Vassili Liuboff, whom they shot, but commended for his loyalty. "Does that sound," he concludes, "like anything that we have heard from either side in the present conflict?" Yes, indeed; has he not read of the splendid military funeral given to Capt. Mueller, of the Bluecher, who died a prisoner in Edinburgh Castle? And yet the great warship he commanded was on its way to shell the coast towns of eastern England. Anglo-American civilization has never been behindhand in such manifestations of chivalrous courtesy.

Among the fifty papers, there are several which claim particular attention. The seventh in order, entitled "The Pacific Coast Peril," by Mr. Francis B. Loomis, former Assistant Secretary of State, is the result of a visit to California and a careful personal examination of actual conditions. He contends that the present "irritating and humiliating discriminations toward the Japanese should cease." He denies that they are going to overturn California, to acquire a considerable portion of the land, to get an undue share of business, to snap up the Philippines. Moreover, "the Japanese people have an historic and sentimental bias in favor of the United States; those already here are on the way to become excellent citizens"; and *"if they were let alone or were given the ballot and citizenship, the whole question would disappear."*

Another valuable article is "Treaty Thraldom and Release," by Mr. Albert Shaw, editor of the *Review of Reviews*. He pays a deserved tribute to the personality and labors of Townsend Harris, who went to Japan in 1856 as Consul-General from the United States and won the lasting good-will of the Japanese people. Harris inaugurated a policy which made them believe that, more than any other nation, the American Government has been actuated in her Oriental policy "by the principles and motives that govern private relations among just and considerate men."

Several of the papers, notably the last, by the editor of the whole symposium, give expression to the hope that Japan will prove the helpful brother to China in educating her and bringing her into the international fold, "acting as guardian *pro tem.*" He would recommend that we "coöperate with Japan in every way possible, and ultimately we shall also benefit by the increased purchasing power of China which will come through Japan's activities." Unfortunately for this hope, Japan has not shown that she is capable of acting as a teacher of Western civilization. The thousands of Chinese students who flocked to Tokio within the past decade, to be modernized at second hand, seem to have acquired nothing but political restlessness; the two nations do not understand one another; and to-day Japanese goods and the Japanese coinage are boycotted far and wide by angry Celestials. China, like Japan, will have to come direct to the West for her education, and we need not hamper ourselves with an unpopular partner.

THE FIRST ELLIOTT MONOGRAPHS.

Flaubert's Literary Development in the Light of His "Mémoires d'un Fou," "Novembre," and "Education Sentimentale." By A. Coleman. Baltimore: Johns Hopkins Press.

Sources and Structure of Flaubert's Salammbô. By P. B. Fay and A. Coleman. Baltimore: Johns Hopkins Press.

La Composition de Salammbô. By F. A. Blossom. Baltimore: Johns Hopkins Press.

The series of Johns Hopkins monographs, edited by Edward C. Armstrong and dedicated to the memory of A. Marshall Elliott, professor of Romance languages in the Johns Hopkins University from 1876 to his death in November, 1910, begins with three studies of Flaubert. Though dated 1914, these monographs, according to the advertisement in *Modern Language Notes*, constitute "the issue for 1915." The first and longest is "Flaubert's Literary Development in the Light of His 'Mémoires d'un Fou,' 'Novembre,' and 'Education Sentimentale' (version of 1845)," by A. Coleman. The other two are "Sources and Structure of Flaubert's Salammbô," by P. B. Fay and A. Coleman, and "La Composition de Salammbô d'après la Correspondance de Flaubert (1857-1862) avec un Essai de Classement Chronologique des Lettres," by F. A. Blossom.

The three volumes are a valuable addition to our knowledge of the remarkable writer who, in this country at least, however much has been written of him in France, is often little known, except in "Madame Bovary" and "Salammbô." Yet in American libraries, during the last five or six years, books have been accessible giving much trustworthy information about Flaubert, which the authors of these mono-

graphs frequently refer to—studies of various phases of the man and his work by René Descharmes and René Dumesnil, and also E. W. Fischer's "Etudes sur Flaubert Inédit" (with a detailed account of his earliest "Tentation de Saint Antoine"), translated from the German into French. Like these, the Elliott monographs—as their titles indicate—consider the early work of Flaubert, the formative years of his life, and (with detailed study) various matters connected with "Salammbô."

The second and third of the three volumes deal with such special material and treat it so technically that they must serve chiefly as reference books. But aside from the particular information which they give, the most interesting part of which concerns the use that Flaubert, in writing his Carthaginian romance, made of Polybius, they throw new light on the deliberate, painstaking study, always refusing obstinately to be hurried, that was so important an element in Flaubert's art. They show clearly that the barbaric details of many a picture in "Salammbô" which seem the product of an incredibly, if not even madly, exuberant imagination, are after all based on the minutest research.

The first volume, dealing with Flaubert's literary development in the first twenty-four years of his life, considering him as both a "romantic" and a realist, is much less technical than the other two, and so is likely to prove of more general interest. Yet even this might to advantage show in its style less scholarly coldness and more enthusiasm for its subject. Since certain learned bodies have given their sanction to *thru* for *through*, and a few similar misspellings, it is perhaps unreasonable to wish that they did not appear in Mr. Coleman's work, as they do also in the other monographs. Even so, most readers will regret their presence. But when these objections are made, there is little to say of this volume except in praise of its careful investigation, clear statement of fact, and critical soundness. To many readers its most interesting information will be of Flaubert's indebtedness in "Novembre" to Gautier's "Mademoiselle de Maupin"—an indebtedness, unless the reviewer is mistaken, now pointed out for the first time. The resemblance between the stories, as stated in the monograph, appears conclusive. But all the information here given is interesting to a student of Flaubert as well as useful.

All in all, these monographs give no different impression of Flaubert from that which we had previously got from M. Descharmes's "Flaubert . . . avant 1857." None was to be expected, for M. Descharmes did his work with persuasive thoroughness. What they do is very usefully to enlarge our stock of information about the great French novelist. And one who reads the three monographs will understand better than he did before how the coldly contained realist of "Madame Bovary" could dream the dreams in "Salammbô" of the richest splendor of "the gorgeous East" and its unspeakable savagery.

Notes

Henry Holt & Co. announce that they will shortly add to their American Historical Series "A Short History of England and the British Empire," by L. M. Larson.

Small, Maynard & Co. announce for publication in the autumn "The Silver Ring," by Frank R. Adams.

Among the forthcoming publications of Harper & Bros. are: "The Inner Law," by Will N. Harben; "The Trail of the Hawk," by Sinclair Lewis; "The Story of a Pioneer," by Anna Howard Shaw, in collaboration with Elizabeth Jordan; "The Laughing Muse," by Arthur Guiterman; "Mark Tidd in Business," by Clarence B. Kelland.

T. Fisher Unwin announces the publication of "The World in Conflict," by L. T. Hobhouse.

"The Curious Lore of Precious Stones" and "The Magic of Jewels and Charms," by George F. Kunz, will be published in the autumn by J. B. Lippincott Co.

The Century Co. announces the forthcoming publication of "A History of American Literature," by Fred Lewis Pattee; "Pegeen," by Eleanor Hoyt Brainerd, and "The Strange Story of Mr. Dog and Mr. Bear," by Mabel Fuller Blodgett.

"The Elements of the Great War: the First Phase," by Hilaire Belloc (Hearst's International Library Co.; $1.50 net), is the first of six volumes. From this allowance of space one may assume that the author expects the war to last three years or more. Mr. Belloc brings to his task the lucidity and picturesqueness which have ever distinguished him as essayist and historian. He has had military training in France and has walked over much of the terrain now the scene of operations. He is a devotee of the diagram, and has the knack of simplifying larger movements in a fairly Euclidean fashion. About half of the present volume is given up to preliminaries—considerations of races, population, and conflicting national ambitions. The second half describes the German rush in Belgium, northern France, and Poland, terminating on the eve of the battle of the Marne. In this first phase of the war Mr. Belloc asserts that Germany fought on both fronts in a superiority of about three to one. The checking of this onslaught inaugurates the second, static, phase in which the Allies gradually attained equality of numbers; the third phase in which their numerical superiority becomes pronounced is just opening. In describing the advance on Paris Mr. Belloc is most lucid. The French defence was that of the operative square, the French Fourth and Fifth Armies and the British contingent having the duty of leading the attackers to the point where they could be met by superior forces. The plan nearly failed through the speedy crumbling of Namur and the tardiness with which the order to withdraw reached Sir John French. Possibly an undue amount of space is given to the British manœuvres, yet when it is recalled that the material for such a record is more complete than that for the French movements, and that the British held the crucial position during the retreat, Mr. Belloc can hardly be blamed for his choice of emphasis. The book is a model of clear exposition, a true analytical history and not a simple military chronicle. It is and promises to be the most satisfactory work of its scope. It deserves and doubtless will have a wide reading.

Hammond V. Hayes's "Public Utilities, Their Present Value and Return" (D. Van Nostrand Co.; $2 net), deals with a situation out of which order may some day be resolved, but which at present is little short of chaotic. The author is an engineer of peculiarly unbiassed mind, intent upon reaching conclusions which shall be sound both in law and in economics. His subject, though of the highest importance, is not one that lends itself to popular treatment, and it cannot be said that Mr. Hayes has made much effort to bring it down to the level of ordinary intelligence. He is wise in foregoing the attempt. The lay mind is unusually active at this time in debating the question of public utility values, and, it is to be feared, with fully as much harm as good to public interests. The State has taken in hand the valuation of public utilities without due regard to two facts: first, that in science (public utilities embody the most complicated principles of science) things are not always what they seem to the untrained mind, and, secondly, that it is not, as a rule, wise to call the shoemaker away from his last. In other words, the State has undertaken one of the most technical of all tasks, and has delegated its performance to agents versed in popular rather than scientific discourse. In order to be scientific it is not necessary to employ a jargon, but it is necessary that every word shall connote a fact, and that none shall connote an imagination. This implies a restraint which puts the product outside the range of ordinary political discussion. We may not subscribe to all of Mr. Hayes's conclusions, but we may be sure that he has reached them by the approved means of the science with which his subject deals. He has, in short, produced a work which all rational students of public utilities will welcome.

Three new volumes on government present the clash of opinion that characterizes current discussion of the subject in this country. In "The Democracy of the Constitution" (Scribner; $1.50 net), which is a collection of addresses and essays, Senator Lodge vigorously opposes the innovations of the initiative, the referendum, and the recall. Any one who takes this position has to meet the charge of want of faith in the capacity of the people to govern themselves. Senator Lodge does not flinch from this issue. He points out that "the people" is a very loose term. It is the voters who do the governing, "and the voters are not the people, but a small portion of the people—not more than a fifth or a sixth part." Even this fraction is materially reduced in most of the elections, at which measures rather than men are voted upon, and this abstention from the polls, in Senator Lodge's view, is one of the elements to be considered in placing new burdens upon the electorate. It may easily mean an increasing amount of government by minorities. But this is not all. Senator Lodge is a sturdy defender of representative government as aganst "direct" government, because he believes that, while the popular will must in the end prevail, it is necessary to guard the rights of all the people against ill-

considered action on the part of those who cast the votes. In a word, he stands for a system that will not only permit, but compel, so far as a system can compel, the sober second-thought that advocates of direct government seem to think our democracy may dispense with. His presentation of this idea is somewhat injured by the fact of being repeated in successive addresses or essays, which gives it an effect of monotony. In this respect the book would have been improved by cutting and summarizing. Deserving of separate mention are his contributions on John C. Calhoun and Thomas B. Reed, and the miscellaneous papers with which the volume concludes: "An American Myth," an interesting analysis of a reputed incident at a trial in which Alexander Hamilton and Aaron Burr were of counsel for the defence; "As to Anthologies"; "The Origin of Certain Americanisms," and "Diversions of a Convalescent." The final paper is of a personal nature that distinguishes it from all the rest, and reveals the writer in the rôle, not of publicist or littérateur, but of lover of the classics and of the world of the imagination.

On the opposite tack is "The Progressive Movement," by Benjamin Parke De Witt (Macmillan; $1.50 net). The bulk of Mr. De Witt's book is informative, but he does not conceal his sympathies and antipathies. Beginning with a sketch of our government history, he traces the progressive movement in the Democratic, Republican, Progressive, Socialist, and Prohibition parties, and then, in turn, in the nation, the States, and the cities. By "progressive" he means three things: the abolition of corruption, control by the many rather than by the few, and extension of the functions of government. His discussion of certain proposals under these heads suggests that there is need of a discrimination between terms. If popular election of President and recall of judicial decisions and of judges as well—Mr. De Witt is able to swallow both—are "progressive," what would he call "radical"? The most useful chapter in the book is the one on The Efficiency Movement, concerning which the author writes with a first-hand knowledge. As a prophet he is less capable, risking the assertion that "the Progressive party has before it a bright future." Prof. Thomas H. Reed's "Government for the People" (Huebsch; $1.50 net), is of uneven merit. It is thoughtful, but does not penetrate far beneath the surface. The chapter on Our Judicial Dilemma is one-sided and alarmist, and Professor Reed has not considered all the consequences of his proposal for Cabinet government at Washington. He is best in discussing the administration of education. The lists of references at the ends of the chapters constitute a working bibliography of recent books and articles on our problems of government.

The title of Mr. Henry Osborn Taylor's book, "Deliverance: The Freeing of the Spirit in the Ancient World" (Macmillan; $1.25 net), is alluring. The prospective reader pictures to himself a high spiritual satisfaction in retracing the paths of the great souls of the past, serene or troubled as the case may be, towards what President Eliot has called the durable satisfactions of life. Anticipation is heightened by the legend on the wrapper: "This book has nothing to do with the war; yet it is a good book to read now, as it has much to do with the profounder peace of mind which the wise man or woman will in some way keep, through some mode of reasoning or devotion, whether in calm or troubled times." And the high plane of promise is preserved in the Prologue. "One realizes a universal kinship in human need and aspiration when following such thoughts seemingly afar in the minds of these Founders who have passed on," writes Mr. Taylor. "They who may have died ages ago are nearer to us than the alien masses among whom we move. They are the spiritual fathers of us all, and we make ourselves consciously their sons by coming to know them in their achieved or striven for adjustment of themselves with the eternal, and in their attunement of their desires to human limitation. . . . Although that which those ancients reached, or even that which they tried for, may not be for us, still the contemplation of their efforts is as the effect of noble sculpture and poetry, bringing something like the final calm, the emotional purge, of tragedy." Thus the expectant reader is keyed up to a high point. To fulfil the hopes raised would require a universal theologian doubled with a seer of reconstructing and inspired imagination, and such requirements are beyond Mr. Taylor in the great field he has attempted to cover, from Chaldæa and Egypt, China, India, Zarathushtra, Israel, the Greeks, Jesus, Paul, to Augustine. Often he shows first-hand knowledge, but even then he gives a somewhat pedestrian summing up of information to be tabulated, rather than a picture of that Deliverance which has proved a boon in time of doubt and trouble to the thinkers of the past. And in the places where the knowledge has been borrowed, one wonders if Mr. Taylor really thinks the adjustments he describes have actually proved a deliverance to any one. There are pleasant places in the book, as in the summary of Plato's thought, but the reader is seldom carried to those heights on which he expected to tread when he read the prologue and the title. Perhaps, however, in these troublous times one yearns too much for a sight of real deliverance; perhaps but few have ever found it.

The annual "Reports" of the John Carter Brown Library at Providence are always welcome, for they are brief and not overloaded with statistics. That covering the year 1914-1915 is no exception to the rule. It is clear that the institution is becoming more and more useful to students of American history and bibliography throughout the country and beyond our borders. If an example of the library's usefulness and preëminence in certain fields were needed, it is forthcoming in the fact that Mr. Charles Evans has found its collections of such value to him, in the compilation of his "American Bibliography," that he has dedicated the eighth volume (1790-1792), in glowing terms, to the institution. Mr. Evans found there 571 of the 2,777 titles contained in the volume. The choicest, if not the most important, acquisition of the year is the first product, so far as is known, of the South American press, the "Doctrina Christiana," printed at Lima in 1584. The book is in the Quichua and Aymara languages, as well as in Spanish. Another title, of which only one other copy is recorded, is the "Life" of St. Antonio of Padua, printed in the native Mexican tongue in 1605. In reading this "Report" one is impressed by the fact that the introduction of the photostat has been productive of great good. It is now possible for libraries to procure photographic prints of rare newspapers, broadsides, manuscripts, and books, even, at small cost. What this means in enabling libraries to complete their collections, and in the saving of the originals from wear and tear, can scarcely be overestimated. The Library of Congress, the John Carter Brown Library, and the Massachusetts Historical Society are foremost in this work. The "Report" closes with a merited tribute to the services of the retiring librarian, Mr. Winship.

Some years ago the Commercial Museum of Philadelphia undertook to make a "graphic history of commerce from the earliest dawn of trade and barter down to the present time." The preparation of this exhibit was entrusted to Mr. Wilfred H. Schoff, the secretary of the Museum. Mr. Schoff's studies soon led him to realize the importance of those ancient writers who are commonly grouped together as the Geographi Graeci Minores, and the need of making the fragments of their works more accessible to English readers. A beginning was made in 1912 by two publications: "The Periplus of the Erythræan Sea," a book of 328 pages, consisting of an introduction, a translation of the Greek text, and full notes and indexes, and "The Periplus of Hanno," a monograph of 34 pages, with the Greek text, translation, and notes. "The Parthian Stations of Isidore of Charax" (25 cents) forms the third number in the series. In make-up it resembles the "Periplus of Hanno." We have first the Greek text, with a translation on the opposite page; then various fragments of the writings of Isidore that have been preserved by Athenæus, Pliny, and Lucian (these also with translations); then a commentary, made up principally of notes on the places mentioned, with numerous references to ancient and modern writers and occasional quotations; "Parallel Passages from the Chinese Annals," quoted from Hirth's "China and the Roman Orient," and "A Modern Account" of trade routes in Persia, excerpted from Curzon's "Persia." Two maps serve to make the route described by Isidore clearer, and the pages are enlivened by reproductions of two Parthian coins and by pictures of a modern camel train and a Persian caravanserai.

A monograph of this sort is calculated to appeal to several classes of readers, each of whom will probably find shortcomings from his own particular point of view. The classical scholar will be disturbed by occasional misprints in the Greek, a slip or two in translation, omission in the list of printed editions of that of E. Miller, Paris, 1839, and the indefiniteness of some references, such as "Cf. also Tacitus." The business man (assuming such a reader) will probably find too much "gelehrtes Beiwerk" and wonder what connection there can possibly be between a note on the cult of Anaitis and the expansion of American trade. The traveller may think that fuller references to modern conditions and modern writers would be preferable to so many comments on ancient conditions and ancient history. All this, however, only shows the difficulty of the task of compilation which Mr. Schoff has undertaken; and the fact that readers of all these classes are sure to find something of interest and are supplied with the means of reading fur-

ther along particular lines if they desire to do so shows how well the task has been performed. To make a work like that of Isidore accessible to readers who command "small Latin and less Greek" is certainly worth while, and it is to be hoped that the authorities of the Commercial Museum will continue to encourage this part of the activities of their secretary and perhaps to give him more time to pursue such studies. In that case the impression of haste which is conveyed by several rather obvious slips in proofreading in the "Parthian Stations" could doubtless be avoided.

"The Interpretation of History" (Dutton; $1.75) which Lionel Cecil Jane adopts is based on the idea that all history is "a record of the eternal conflict between the desire to rule and the desire to be ruled." The desire to rule is Individualism and finds expression in such movements as Protestantism, laissez-faire, and democracy. The desire to be ruled, which for lack of a better term the author calls Universalism, is seen in Catholicism, Socialism, paternalism, and all forms of absolutism. This eternal conflict, inherent in human nature, is "internal" when it determines the relations of the individual to the state; it is "external" when it manifests itself as a conflict between the national state and the universal empire or the international projects which look to the general interests of the whole world. In the ceaseless conflict complete supremacy is never attained either by Individualism or by Universalism; the proximate victory of one is invariably followed by a reaction in favor of the other. History is the record of these oscillations. All the historian has to do in order to interpret the past or predict the future is to determine whether Individualism or Universalism is for the moment in the ascendency. Such a bald statement, however, of Mr. Jane's theory scarcely does justice to the ingenuity with which he has worked it out and set forth the facts of history which support it. To his credit be it said, he has a sound knowledge of history and does not pervert it to suit his theory; on the contrary, he modifies his theory with so many historical exceptions and interpretations that it loses something of the beauty of its simplicity. This, of course, is inevitable. The factors in human history, like the factors in the stock market, are too complex to be fitted into any simple formula. The historian who tries to predict the future from the oscillations in the conflicts between Individualism and Universalism, like the investor who studies the charts of the swings of the market, will always find it a bit troublesome to determine just the moment at which the pendulum is about to swing in the opposite direction. Nevertheless, many of the conclusions which the author says he worked out before the present war are being sharpened and emphasized as truths by the events of the past year.

"Europe is not to be saved by any single man," replied Pitt in 1805, a few weeks before his death, when the Lord Mayor proposed his health as the Saviour of Europe: "England has saved herself by her exertions, and will, as I trust, save Europe by her example." England did. In fact, whenever in modern times military despotism has threatened the security of Europe, whether in the days of Philip II or Louis XIV or Napoleon, the seapower of England has proved its most formidable obstacle. England in saving herself has helped to save Europe. It is a great tradition; and she is called on to maintain it to-day more urgently than ever before. There is no nobler figure in the tradition than William Pitt. It is in the hope of renewing his appeal to the hearts and minds of his countrymen, and recalling his example to their memories, that R. Coupland has reprinted, with appropriate introductions and notes, "The War Speeches of William Pitt the Younger" (The Clarendon Press; 2s. 6d.).

"The Legal Principles of Public Health," by H. B. Hemenway (Chicago: T. H. Flood & Co.; $7.50 net), is a pioneer in a domain where law and science intermingle. Diseases which our ancestors looked upon as special visitations of an offended deity have been found by medical science to originate in human carelessness or wickedness. Their abatement is to be sought not in sacrificial offerings, but in education and self-restraint. Modern health laws do not subject the members of a community to sackcloth and ashes, but to personal cleanliness; to the sanitation of dwellings and places of business, and to a reasonable compliance with the demands of preventive medicine. Water supplies are to be carefully guarded. Milk and other food products must be submitted to inspection. The victims of certain diseases are segregated to prevent the spread of epidemics. In many other respects, personal liberty is invaded and the enjoyment of private property is limited by the State in the exercise of its police power. How far such invasions and restrictions may be carried consistently with established constitutional principles is a source of constant discussion in this country. As a rule, health officers are disposed to press the police power to their extreme limit, and to call for more and still more drastic legislation in that behalf. Dr. Hemenway, however, is not dominated by this spirit. His experience as a public official has convinced him that there is grave danger at present of overlegislation. He is not the champion of radical forms of eugenic statutes. He does not believe that our communities are to be converted into Utopias by legislative fiat, nor by administrative skill. In his opinion, there is greater need of moderation and sound common-sense, on the part of health officers, than of a disposition to push their authority to its full statutory limit, which often borders on the despotic. In fact, the volume before us merits the commendation accorded it in Dean Wigmore's Introduction, of being "original, carefully studied, practical, well balanced, and progressive." It should be helpful not only to health officers, but to lawyers and judges who are called upon to deal with the legal side of modern health problems.

The late Lord Strathcona was in every way so notable and picturesque a figure in the public life of Canada that his death inevitably has been made the excuse for a crop of biographies. Two of these are of the familiar laudatory type, and not worthy of any further mention. Mr. George N. Morang, the Toronto publisher, announces a Life in preparation by Prof. John Macnaughton, of McGill University. Mr. Beckles Willson is also working on what promises to be the most complete, as it will be the authorized, biography of Strathcona. Both of these should be worth attention, but judgment must of course be reserved until the books are actually published. The only Life at present available that makes any claims upon the intelligent reader is that by Mr. W. T. R. Preston, "Strathcona and the Making of Canada" (MacBride, Nast; $2.50). We do not wish to do Mr. Preston any injustice, but the impression left upon one's mind is that of a rather deliberate effort to picture Strathcona as the evil genius of Canada. There can be no question as to the cleverness, sometimes almost brilliancy, of Mr. Preston's style; or of the very readable account he has given us of the wonderfully varied and adventurous career of a man who rose entirely by his own efforts from the seemingly impossible position of an obscure fur-trader on the coast of Labrador to one of the highest offices in the gift of his country. It is rather the more to be pitied that the book is marred by a point of view which appears to be hopelessly warped. In an Appendix Mr. Preston prints several documents, extracts from the Canadian Hansard, etc., in support of statements made in his narrative; but it would have been better for his own reputation as an impartial biographer if he had either offered further documentary evidence, or refrained from making statements, hints, and innuendoes which could not be supported by satisfactory proof.

In his "New Testament in the Twentieth Century" (Macmillan; $3 net) Mr. Maurice Jones collects and collates briefly what much of the best scholarship of the present century has to say "with reference to those matters which have not yet emerged out of the region of controversy." Recognizing the fact that modern students of early Christianity insist on applying to the New Testament the principles employed in investigating the documents of other religions, our author reviews at the outset recent questions as to whether Jesus or Paul is the founder of Christianity, as to whether Jesus lived an historical life, as to the place of eschatology in His teaching, and as to the influence on Paul of the religions of mystery. Then he deals with current problems in reference to the Synoptic Gospels, some of the Epistles of Paul, and the Johannine writings. Widely read in the relevant English literature, acquainted with the results of French and German scholarship, and conscientious in his exposition of the opinions of others, our author furnishes an intelligent introduction to the difficulties which confront New Testament scholars. It may be added, as throwing light on the activities of some English army chaplains in times of peace, that Mr. Jones is a "chaplain to the forces."

Those of us who have had the privilege of travelling through the byways of England are wont to think only of the picturesque aspect of the villages and hamlets and isolated cottages occupied by the very poor. If, however, we happen to read Dr. William G. Savage's "Rural Housing" (T. Fisher Unwin), we are made to realize that these habitations are in a very large number of cases badly constructed, ill-ventilated, and in general unsanitary; a deplorable state of affairs which is depicted by the author as a natural result of the development of the agrarian system of England in the past. Dr. Savage has made a careful study of the resulting "acute and urgent" problems from all points of view, and urges modes of reform which appear to be thoroughly practical. The book is profusely illustrated with photographic plates, which, while somewhat grewsome, are thoroughly convincing.

Science

PHYSICAL ADJUSTMENTS TO EMOTIONS.

Bodily Changes in Pain, Hunger, Fear, and Rage. By Walter B. Cannon. New York: D. Appleton & Co. $2 net.

The complex mechanism of the body is sometimes separated roughly into the organs of animal life, including the voluntary muscles, and those of the vegetative life, including the visceral organs concerned in the processes of digestion and nutrition. Over our voluntary muscles we can exercise conscious control, and scientific investigations have revealed the location in the brain of the nerve centres through which this control is exerted, as well as the efferent paths through which the nerve impulses aroused by volitional effort pass to the muscles that are set into action. But the organs of the so-called vegetative system lie wholly outside the field of action of the will. They are regulated through a group of nerve fibres designated in modern physiology as the autonomic system which supplies the plain muscles and glands of the viscera. The origin and distribution of the autonomic fibres have been worked out with considerable completeness, so far as their peripheral distribution is concerned, but little is known of their course and connections within the central nervous system. It has been assumed in a general way that they are brought into functional activity by reflexes of an unconscious nature. Cannon's new book brings out in an impressive way the striking fact that this great system is constantly acted upon by strong emotions or sensations, like fear, rage, grief, and pain.

Through these conscious states, which presumably involve an activity of the cerebral hemispheres, impulses are set going that find their peripheral outlet in the visceral organs. "Emotions gain expression through discharges along the neurones of the autonomic nervous system." While it is a part of common knowledge that our emotions may affect digestion and other forms of visceral activity, this vague impression now receives a more precise and scientific form from the researches described in this book. Experimental evidence is furnished to show that strong emotions affect the adrenal glands, causing them to increase their normal secretion of adrenin, with the result that there is a contraction of the blood-vessels in the abdominal viscera and, therefore, a shifting of more blood to the heart, brain, lungs, and voluntary muscles. Moreover, through the action of this adrenin, the heart is made to beat more vigorously, the effects of muscular fatigue, if present, are removed, and the liver pours out more sugar into the blood. By a similar action the whole process of digestion and secretion in the stomach and intestines is brought to a standstill. The author sees in all of these reactions a useful adaptation to times of stress. These changes are of a preparatory or anticipatory character, adapted to put the body on a "war-footing," so that the animal is ready for fight or for flight—activities which we may suppose have always been called for under conditions which would excite fear or rage.

This idea is elaborated at some length, much indirect evidence being adduced in its support. The scientific reader may object at places to a tendency to make rather free use of analogies and figures of speech, and also to the fact that in his enthusiasm for the general position taken in regard to the utilitarian or adaptive character of these emotional expressions the author at times fails to take into account certain obvious objections to his theory. We can understand easily that, in a period of stress requiring maximal muscular activity, it may be valuable to an animal to have an increased supply of sugar in its blood for the use of the muscles, or a greater flow of blood to the brain and heart, or a secretion that antagonizes fatigue in the muscles or accelerates the clotting of blood, but what value does the body derive under such circumstances from a suspenion of the movements and secretions of the alimentary canal? The author falls back on his "war-footing" analogy, and suggests that the shutting down of activities in the abdominal organs frees "the energy-supply for other parts," but he fails to indicate how the potential energy that may be stored in the muscles or glands of the intestines is made available for other organs. Some of the blood of the intestines is diverted to other organs, where it may be of more use for the time being, but if the stomach and intestines happen to be in full action at the moment, a complete cessation of their functional activity is, it would seem, a misfortune rather than a direct benefit: it certainly gives the bacterial flora a chance to get the upper hand. The fact that the digestive processes do stop under such circumstances may be accepted on the evidence furnished, but one may be skeptical about the advantage accruing thereby to the fighting or fleeing animal. The author admits also that great joy may have an effect similar to great fear, but in this condition the preparatory value of all the reinforcing reactions described is not apparent. The same point may be urged also in regard to pain. In the actual stress of fighting or fleeing pain is hardly a factor; it reaches its culminating point after the fight or flight is over, and if at this period it still operates to put the body on a "war-footing," the utility of the process is difficult to see. It may be added also that little attention is paid to the inhibiting influence of the strong emotions, particularly of fear upon cerebral activities. While this effect has not been made the subject of exact studies, it is a phenomenon sufficiently well known, and its value to the individual may be doubted. For at the very time that the victim should have his wits about him, he may, if the fear is strong enough, be wholly unable to command the full use of his mental machinery.

The author concludes his book with a discussion of the fighting emotions and instincts among men on the basis of the physiological effects which, as he has demonstrated, accompany such states. The position that seems to be assumed is that, inasmuch as there is a physiological mechanism of a definite kind that is set into action by strong emotions, this mechanism should receive appropriate exercise in the normal course of life. War implies too many barbarities, hardships, and unnecessary expenditures to make it desirable for such a purpose, and, therefore, as an alternative, the author suggests the encouragement of athletic competitions of a national or an international character. Whether war is more of a benefit than a curse to mankind need not be considered here. It is a wide question in which the ultimate as well as the proximate results would have to be considered. But so far as the physiological argument is concerned, and with that phase this book chiefly deals, it would seem to the reviewer that the author would have done better to take the view that there is no real necessity for desiring the "exercise of our belligerent emotions." The body could get along very well without this exercise, and probably without any harm to the mechanisms involved. An argument for war or for international athletic competitions founded on such a premise may be novel and interesting, but it certainly fails to carry conviction. Aside from this attempt to give these physiological facts a wide practical application in the conduct of life, physiologists and psychologists will be deeply interested in this excellent summary of the investigations made by Cannon and his pupils. They seem to open a way for the fruitful objective study of the emotional states in their effects upon and their relations to the activities of the various organs of the body. The results already obtained and set down in this book are most interesting and surprising.

An attractive book on "Electricity for the Farm" has been written by Frederick Irving Anderson (Macmillan; $1.25). The purpose of the book is to awaken the interest of farmers to the advantages of installing small electrical plants. The many possible uses of electricity on the farm are pointed out, and the details of cost and construction of such plants are discussed. This part of the book is well done, and a clever farmer should be able to follow the instructions and to set up his own plant. The author also pays some attention to the rudiments of the theory of electricity. This discussion is given in a very simple form, and is, on the whole, fairly correct; but there are a number of inexcusable errors. For example: the magnetic lines of force in the diagram on page 95 are quite wrong, and so is the calculation of air leakage on page 104. Fortunately, the purpose of the book is not to explain electricity, but to show how many things now done by hand can be left to electricity; and, above all, the advantage of a safe and brilliant lighting system instead of the ordinary one by kerosene.

Drama

"UNDER FIRE."

Dramatically Roi Cooper Megrue's melodrama, produced last week by Selwyn & Co. at the Hudson Theatre, is probably the best of the "war plays" that have yet been seen. It is, on the whole, good melodrama, well staged, and generally well acted. The author knows the technique of the stage; not a point that can be made is missed, and William Courtenay, as the hero, Felix Krembs, as the villain, and Frank Craven, supplying both the "comic relief" and the sententiousness considered necessary to point the moral, interpret the author's intentions in a manner that could hardly be improved.

Having said so much for the play on its purely dramatic side, we must state roundly that it is a piece which it was wicked to produce at this time. Very few of us have been able, even if we thought it right, to observe the President's early injunction that we should guard the neutrality of our feelings and our private expressions of opinion. That is a thing that no man can be expected to do. But between the expression of opinion by individuals or newspapers and incitement—doubtless involuntary—to a mixed audience in a theatre to make public demonstration of its sympathies there is a vast difference. At this critical time it is manifestly against the public interest that an audience shall be divided into two hostile camps, the one applauding, the other hooting the appearance on the stage of German soldiery engaged in the rape of Belgium. It must be said for the ingenuity of the author, that, although there is no doubt as to what his true feelings are—he is on the side of the Allies—he has displayed not a little cleverness in achieving some appearance of neutrality and in placating the enemy by exhibiting the good as well as the bad qualities of his troops. But we have got past the semblance of neutrality now in our private feelings: we are all of us arrayed on the one side or the other. And the important thing is that this subject, which is lightly made the theme of a realistic melodrama, plentifully besprinkled, in the modern fashion, with comic relief, is one which must touch very closely at least two-thirds of every audience that will see it; one on which most of them feel not only strongly but poignantly. French and English, German, Austrian, Italian, and Slav, all go to make up the composite American audience, and for many, perhaps for the majority, of these, as well as for many native-born Americans themselves, this war is not some impersonal tragedy that is being played three thousand miles away, but is an actual, living horror in which sons or brothers or friends are bearing their part. Is it decent to wring their hearts to make a Broadway holiday?

The management will doubtless assure us of the high purpose with which the play is produced—to bring home to Americans the horrors of war to the end that they may avoid entrance to a quarrel. Well, we do not think that the American public needs any object-lesson of the sort; but, supposing that it does, what is the moral that is dragged in? The American audience is invited to assume the smug, complaisant attitude induced by the consciousness that "I am holier than thou," and to congratulate itself upon the superior wisdom which secures for it the benefits of peace when a number of people in Europe are killing one another from pure lack of intelligence. There are other forms of jingoism besides that which manifests itself in a screeching for war.

S. W.

"SEARCH ME."

This new farce by Augustin MacHugh has some of the quality of "Grumpy" and of "Seven Keys to Baldpate," and it succeeds so well in mystifying the audience that, with a little ironing out of the wrinkles, its popularity seems assured. If for no other reason, the piece is well worth seeing for the finished performance of Mr. Fred Graham, who, as Anthony Moreland, a fussy old English lawyer, provides a great deal of legitimate merriment. The piece is written about the mysterious disappearance of a ruby and the author has succeeded in directing the audience's suspicions successively from one to another of the characters, the interest being well sustained throughout. Of course, the plot is extremely thin at some points, but the action is quickened at the right moment, and the holes are forgotten in the movement of the piece. Sharing honors with Mr. Graham are Howard Estabrook, Montagu Love, and A. P. Kaye. The two feminine rôles are played satisfactorily by Miss Ethel Gray Terry and Miss Ruth Allen.

L.

"THE BOOMERANG."

It is really a compliment when we say that Mr. Belasco and the authors of "The Boomerang," Winchell Smith and Victor Mapes, have achieved the feat of making bricks without straw. To attempt to trace back the processes of an author's mind to the original idea which inspired a completed work is always a hazardous experiment, but we will venture a pretty shrewd guess that what supplied the foundation of this very amusing trifle was the idea of inviting the attention of an audience to the spectacle of a man with a clinical thermometer in his mouth. That is as good an excuse as most for writing a play and a great deal better than many. The co-authors of "The Boomerang" realized that what was required beyond this idea and the stage production of Mr. Belasco was very little; so they simply took an old story about jealousy and the efforts of one man to cure another of the malady, and how he was attacked by it himself, and wrote it all around the central incident of the clinical thermometer. In what proportions the success of the piece should be attributed to the authors, to the stage management, and to the players, we need not speculate, but to the acting of Arthur Byron, Wallace Eddinger, and Miss Martha Hedman must be attributed a considerable share of credit for the very pleasing result.

Budd Woodbridge, a love-lorn swain, is brought by a fond mother to the office of Dr. Gerald Sumner, a young physician with ideas but no patients. Budd's case has defied the analysis of the family physician, but the young doctor forthwith diagnoses it as love and jealousy and prescribes a course of treatment in which not the least prominent feature is the ministrations of an untrained nurse whom the doctor has just attached to his office. The main idea of the treatment is to distract Budd's mind and to make the object of his affections jealous in her turn. Its result, needless to say, as well as being completely successful in bringing back the errant lady to Budd's arms, is to infect the doctor himself with the disease, he having in the meantime discovered that he has fallen victim to the charms of his fascinating office attendant. It is needless to specify further. The merit of the piece lies in the technical ingenuity with which this slight fabric is worked up into a really amusing comedy that it is refreshing to witness. Wallace Eddinger, as Budd Woodbridge, scores a notable individual success, to which his command of facial expression contributes in no small degree; Miss Hedman, with her delightful trace of foreign accent appropriate to the part, is a comely and altogether charming nurse, Virginia Xeiva, and Arthur Byron plays easily the comedy of the doctor's part. As illustrating the finish of the stage management, it is sufficient to allude to a scene in the first act in which three giggling girls give an exhibition of simultaneous conversation. An every-day incident of ordinary life, this is an effect rarely achieved with naturalness by ladies on the stage.

S. W.

"THE GIRL WHO SMILES."

In presenting this piece the Times Producing Company has brought to the Lyric Theatre a musical comedy in which author and composer have dispensed with the usual features that are supposed to be essential to success. However commendable their course may be, the result will be watched with perhaps a little apprehension. For one thing, there are no "catchy" tunes in "The Girl Who Smiles," and, strictly speaking, only one ensemble throughout the three acts. It is, in fact, a farce set to music. While it is slow in getting started and actually comes to a full stop at the end of the second act, when the hero has won the heroine, it is wrenched into tolerably good farce at the beginning of the third act. Unfortunately, however, the situation is not sustained and interest flags before the final curtain. The piece, which is by Paul Hervé and Jean Briquet, and has been adapted by Adolph Philipp and Edward A. Paulton, would suffer nothing by elimination of one particular scene.

There is unmistakable good work in the three little plays by Mrs. Havelock Ellis, published under the title "Love in Danger" (Houghton Mifflin; 75 cents). Each furnishes an episode of life in a Cornish village, and all are written with a strong sense of character, dialect, and local atmosphere, and with notable simplicity and vigor of expression. The best of them is "The Mothers," which is not only a variation upon the stale theme of the domestic triangle, but illustrates the redemptive power of maternity in original and striking fashion. A widow, with children, is wooed by a married farmer—hitherto happy in the possession of wife and family, who has taken a sudden fancy to her. She is not altogether irresponsive, but, thinking of her own children, she is led to consider the case of those of the other woman. So she comes to pity the wronged wife, to whom she goes with assurances that she will give the errant husband no encouragement. The two women, who have been rivals, embrace, and the husband, disenchanted by his rebuff, returns to his allegiance. "The Pixy" is full of local color, and contains some vigorous character-drawing, but is less satisfactory, because of its ultra-sentimentality and indefiniteness. The conduct of the two men can be estimated only through the true character of the woman, which is left in doubt. The story of "The Subjection of Keziah" is cleverly written, but the idea of the plot is trite.

Art

AN ARTISTIC REVIVAL.

Decoration in England, from 1660-1760, and *Furniture in England, from 1660-1760.* By Francis Lenygon. New York: Charles Scribner's Sons. $32 net.

That connoisseurship is moving intensively upon the arts of the seventeenth and eighteenth centuries is proved anew by these sumptuous companion volumes. The movement is, of course, international. It is part of a reaction from inordinate worship of what Mr. Richard Norton has called "the halting, stuttering primitives." The cult of the crude and incomplete, characteristic of twenty years ago and still persistent in provincial circles, appears to be slowly yielding to a new catholicity. We are almost back, indeed, at the attitudes and beatitudes of our great-grandfathers, cherished prior to Pugin and the Gothic revival. Notable on the Continent has been a renewed interest in Bernini and his emotional sculptures. In England, where two generations ago followers of Rickman ripped much of the finest of seventeenth-century woodwork from renaissance churches, writers of books and articles in magazines are to-day nominating Grinling Gibbons as one of the world's greatest artists. American enthusiasm for Georgian architectural modes and their accessories is nothing accidental or sporadic. It belongs to a time which in art, as in other domains of thought and work, has repudiated the logical and narrowly ethical for a generalized eclecticism, a genial disposition to "appreciate."

Taking sides neither for nor against any view of British art of the period in question, let us accuse Mr. Lenygon's text of being somewhat uncritical in the sense that it slights considerations which must occur to every reader who is at all familiar with the literature of the fine arts in the nineteenth century. The era from 1660 onward, as a matter of obvious fact, was one in which respect for the nature of materials and the requirements of a northern climate were largely lost. The taste of the educated and travelled classes turned towards the Venetian baroque, extravagant, vulgar, often tawdry and meretricious. The architect, increasingly likely to be a mere designer without knowledge of practical building, became a "grave copier of copies." Regarded as crafts, most of the arts underwent deterioration. Woodcarving, even in the decades of its most brilliant decorative accomplishment, lost caste as an exemplar of honest, workmanlike processes, since addiction to the glue-pot enabled the artisan, shunning the toil of undercutting, to piece together an apparently solid creation from minute blocks of soft wood. A late tapestry was primarily a picture, and only secondarily, if at all, a handsome and permanent wall covering. The brilliancy of genuine enamelling, inherited from the Byzantines, was succeeded by the insipidity of tinted grisaille. A separation of art from handicraft, to the probable advantage of neither, was, in fact, in progress. Even so clever an artist as Jean Tijou, planner of ironwork that was perhaps the noblest individual artistic achievement of the first half of the eighteenth century in England, was hindered through not knowing his trade; some of his most spectacular designs could not be executed at all, and others were carried out illogically, by *tour de force* of exceptionally skilful workmen.

To detraction of the spirit of this artificial age of the late Stuarts and early Hanoverians there is an answer—one that contends for the coequal value on the one side of form and style of pattern and passion, in whatever art and whatever era, and, on the other side, of content, construction, and adaptability. It is significant, nevertheless, of a change of temper in the home land of Fergusson, Ruskin, and Morris that such a writer as Mr. Lenygon is not especially interested in either adverse or favorable criticism of the tendencies about which he writes. It is also significant of spreading influence of the economic interpretation of history that he throughout emphasizes the expansion of wealth as cause and explanation of changes and vagaries. Suggestively, with no incisive manner or formidable array of data, he shows how a steady accumulation of fortunes after the Restoration encouraged the largest possessors to want surroundings more luxurious and cosmopolitan than simple islanders had heretofore known. These appurtenances of a complex existence, once installed, were a constant incentive to an increasing and imitative bourgeoisie to become owners of similar trappings. Parvenus, like the celebrated Bubb Dodington and Sir Richard Child, began to make big business for artisans as well as merriment for satirists. Their ethical standards, more or less accurately reflected in their acquisitions, were perhaps as high as those of many of the hereditary nobility of a day when "a statesman who was at the head of affairs might easily, without giving scandal, accumulate in no long time an estate amply sufficient to support a dukedom."

The economic situation was thus favorable for a national efflorescence of art—one whose vigor and splendor, even though not always accompanied by the finest taste and sincerity, amply justify both the effort to correlate several arts in the book first named above and the more intensive study of furniture in the companion work. The social aspects conceivably might have been portrayed even more definitively than the author has seen fit to do. It is easily deduced that the movements of fashion which he describes were prominent among the causes of modern capitalism, for middle-class people had begun to clamor to obtain cheaply for house and person things that would look as pretentious as the nobleman's accessories and which could be produced in sufficient quantities only through the invention of labor-saving machines.

Mr. Lenygon's discussion of "decoration" is limited to the arts that make up what is technically known as "interior decoration." Both letter-press and photographic halftones reveal strikingly the extent to which souvenirs of the Grand Tour lent an Italianate character to English eighteenth-century interiors of architectural pretension. Young men of good family went *de rigeur* to Italy to view ancient monuments and become lifelong dilettanti. This was the overshadowing influence of the time, though a crepuscular Gothic revival with which Horace Walpole's name is associated, and a "false morning" premonition of our present phase of interest in Far Eastern art were notable. From Italy were imported the materials of decoration, including bronzes, antique marbles, and pictures. Stucco replaced wood in covering the larger surfaces of walls and ceilings; to execute this work, foreign to the manner of English craftsmanship, arrived such "artists" as Signori Artari and Bagutti, commended by the architect Gibbs as "the best fretworkers that ever came into England." Long before 1760 the technique of the decorators' trade as we know it to-day, organized and directed by overlords from the academies of art, was well established; and, in viewing the many striking illustrations which the author has secured from palaces and manor houses, we get hardly any of the sense of antiquity and remoteness that is impressed by details of baronial castles and mediæval guildhalls. But for the captions, indeed, the observer might hardly know whether he was looking into abodes of luxury of England of the eighteenth century or New York of the present day.

The monograph on furniture follows the lines of the work on decoration. The pictures come from most aristocratic sources. The development of furniture in humbler dwellings is ignored—a limitation which may be displeasing to amateur collectors who like a book to show pieces such as an ordinary person may some time chance upon. The specimens of furniture, nevertheless, which are magnificently reproduced, should be very useful to architects and designers, for they display their respective styles at their best: chairs, stools, and daybeds of prevailingly more elaborate types than those presented by our American writers on furniture; beds, with cornices and curtains, of the grandiose and completely upholstered manner affected by Marot and his followers; tables, often with ornate Scagliola tops imported from Italy; bookcases such as those designed by Sir William Kent with somewhat pedantic insistence on the classical orders; bureaus, commodes, and wardrobes; pedestals and brackets, cabinet stands, mirror frames, and long clock cases. A concluding chapter is given to lacquer, brought in in quantities by the East India Company, and so fashionable a medium for amateurs that the stylish young widow, Mrs. Pendarves, relates in a letter how "everybody is wild about Japan work." Like several other recent writers, Mr. Lenygon censures a disposition to attribute over great importance to Chippendale and his "Gentleman and Cabinet Maker's Directory."

"The Christ of the Men of Art," by J. R. Aitkin (Edinburgh: Clark), means to be both a popular art book and a scholarly and fairly exhaustive treatment of the Christ-figure in the history of painting. The author has traced his subject through the early centuries, through the Byzantine, Italian, Spanish, Flemish, Dutch, German, and French schools, and up to the present day, with a final chapter on The Christ of British Art. The book is handsomely bound and printed, and the forty-nine illustrations add greatly to its value. Art critics and specialists in the history of painting will find in the book nothing new, and indeed it is hardly intended for them. But "the writer hopes," as he says in his preface, "that the book may be of interest to all who love art, and prove an up-to-date introduction to a great subject to ministers, art students, theological students, and all who love to look on the face of the Nazarene."

"What Pictures to See in America," by Lorinda M. Bryant (Lane; $2 net), arouses expectations which it does not at all fulfil. Nothing could be more useful than a thoroughgoing guide to painting in America, after the fashion of the Lafenestre manuals. But this book is by no means thorough. It makes no mention, for example, of the Walker Art Gallery, Brunswick, Me.; of Memorial Hall and the Fogg Museum, at Harvard; of the Wadsworth Athenæum, Hartford, Conn.; of the New York Historical Society, and the collections in the New York Public Library. It seems, in short, to be a desk compilation of a careless sort, and not the result of systematic inspection of galleries. The text is perfunctory and negligible; the two hundred cuts are about the only value in the book. Among errors sufficiently numerous we need only point out that Gardner Symons is not an original member of "The Ten."

Finance

SQUARING ENGLAND'S ACCOUNT.

War history is being written as rapidly in the money markets as on the battlefields of Europe. Nothing more extraordinary than the developments of the past fortnight in international exchange, for instance, has occurred in the money market since immediately after the outbreak of the war, and, though military and financial events are not to be compared, the effect of the fall in the rates of foreign exchange must inevitably be as far-reaching in its own way as any single part of the military campaigns.

At $4.64 on the pound, the price of sterling bills in the New York market compared with $4.76 last week and with a normal level of $4.867; French exchange at more than 6 francs on the dollar, and Italian exchange at 6½ lire on the dollar, each was far off from the normal rates of other years. Compared with the American dollar the pound sterling has been established at a discount of 4¾ per cent., the franc at a discount of 17 per cent., the lira at a discount of 25 per cent.

In Europe, as well as on this side of the Atlantic, bankers, keenly alive to the significance of these discounts, have for days talked of a possible large British credit at New York, against which bills of exchange could be drawn. Great Britain has never before issued a foreign loan, and such a thing at this time found strong objection at London recently, because it was looked upon as involving a confession of financial weakness. A week ago, indeed, the influence of these bankers manifested itself in rather dramatic form. Brought from London to Halifax on a war vessel and to New York by special express, $19,534,000 of gold reached Wall Street in payment of bills drawn here against London, for which London did not desire any extension of credit.

Since completing the £600,000,000 war loan last month, England's bankers were known to have devoted their attention to remedying the international credit machinery, which had been thrown so badly out of balance, and against England. But that they were contemplating record gold shipments here was not thought of; rather a banking credit or a thoroughgoing Government loan was thought possible.

For reasons known best to themselves, English bankers chose to see their country part with gold instead of negotiating a loan. That this market would take British credits up to a certain point had all the time been accepted as foregone. French and Russian credits were accepted. That credits even were offered is not unlikely. But the motor trucks drawn up at the Sub-Treasury last week embodied England's reply to any possible offer of credits. Plainly it had been "No, thank you, we'll pay gold."

As coming from proud Lombard Street, the central market of the world for centuries, there can be no cavilling at the magnificence of paying a foreign nation in gold now, when gold is so sorely needed at home. But are there not other considerations? Gen. Pierre Bosquet said of the charge of the Light Brigade at Balaklava: "It is magnificent, but it is not war." To say the same of the gold shipments, without knowing all the circumstances and also without knowing the purpose of the millions of British-owned securities that came with the gold, would be premature. But gold is a precious thing in Europe to-day.

Granting a continuance of the war for some time to come, and a further growth of our unparalleled export trade of merchandise, what is likely to be the course of exchange? That is a question whose answer puzzles the imagination. Brakes against the decline might be imposed in a number of ways; England might sell more of its vast store of American securities; credits might be arranged with New York bankers for London account; extensive further shipments of gold might be made to this country; there might be a general rise in money values abroad, inducing American capital to seek employment there.

In any or all of these ways it would be possible to stem the fall in exchange on London. But he would be a rash man who should say that any one of them could definitely check the fall in progress. It is an economic proposition that, if England sends enough gold, present sterling rates cannot endure. But enough gold might be an amount equal to England's purchases of munitions; manifestly so much cannot be sent.

Yet exchange is going down at an alarming pace. The largest single consignment of gold London ever sent came in last week, yet within a few days bills on London had gone from a discount of 2½ per cent. to a discount of nearly 5 per cent. Because of the huge purchases of munitions from our manufacturers, the demands for payment are extraordinary.

At this moment, London is planning to send gold to us from South Africa and Australia; further shipments by way of Halifax will probably be attempted. The question then is, Can England possibly finance the movement of war material, now that immense payments on contracts for munitions are coming due, unless much larger advances are obtained from this market, either through the sale of short-term paper or the negotiation of one or more direct loans? The answer cannot be long delayed.

The Decoration and Furnishing of Apartments

by **B. Russell Herts**

8°. 8 color prints. 24 black and white plates. $3.50 net.

An illustrated analysis of the problems of the modern apartment from a decorative and architectural viewpoint, treating of the requirements of apartments ranging from two rooms to the duplex and triplex. Types of furniture, what must *not* be done, how the greatest usefulness may be obtained from the rooms of a small apartment, the achievement of variety for bedrooms, and numbers of other essential suggestions are treated practically and with necessary thoroughness. A unique volume that will fill a real want.

Neurasthenia

A New Book

By Dr. John Harvey Kellogg

In his new book "Neurasthenia," Dr. Kellogg maintains that "nervousness is a symptom—*not a disease.*" He further maintains that nervousness may be controlled and corrected through cultivation of natural habits. The method is set forth in his book. Dr. Kellogg speaks from the standpoint of over forty years' practice. During most of this time he has been Superintendent of the great Battle Creek Sanitarium, where he has treated and prescribed for thousands of cases of nervousness. Therefore, his knowledge comes from experience. Dr. Kellogg deals with facts and his book gives directions which are invaluable to nervous people. You are told how to diet, exercise, rest and sleep so that you may obtain relief from the dread fangs of nervousness. Over 300 pages, with numerous illustrations. The regular price of the book is $2. but, to give the work wide distribution, Dr. Kellogg permits an edition in library paper covers to sell at $1. per copy. Send your order and remittance today. You take no risk. If you are not entirely satisfied with the book, it may be returned for prompt refund. Address your order and remittance to—

The Nation

NEW YORK, THURSDAY, AUGUST 26, 1915.

Summary of the News

The White Star liner Arabic, sailing from Liverpool to New York, was torpedoed without warning by a German submarine off Fastnet, on the south coast of Ireland, last Thursday morning. This is not far from the place where the Lusitania was sunk. The Arabic went down within ten minutes after she was struck, but owing to the courage and efficiency of captain and crew, who got the passengers off with little confusion, the loss of life was comparatively small. According to a statement given out at the White Star office Saturday night, all but thirty-nine of the 423 persons on board are known to have been saved. The missing and the known dead comprise twelve cabin passengers, six steerage passengers, and twenty-one members of the crew. Among the lost are two Americans, Mrs. Josephine L. Bruguière, of New York, and Dr. Edmund F. Woods, a surgeon of Janesville, Wis., who was returning to this country after a service of three months with the American Ambulance at Neuilly, France.

Doubt as to the status of the Arabic at the time when she was torpedoed was in great measure removed by a communication sent to Washington by Ambassador Page, who stated that the vessel was not under convoy of British warships, and, further, that the submarine gave no warning of its attack. The British Admiralty also asserted that the steamer Dunsley, which was torpedoed in the neighborhood of the Arabic shortly before the latter was sunk, was not a patrol boat, but a "peaceful and unarmed trader." But it was understood that until the sinking of the Arabic was definitely established as a case entirely parallel to that of the Lusitania the President would proceed most cautiously. On Monday Secretary Tumulty gave out the following official announcement: "As soon as all the facts regarding the Arabic are ascertained, our course of action will be determined."

The tenseness of the situation was considerably relieved on Tuesday when Ambassador Bernstorff forwarded to the State Department a communication which he had received from his Government. This document, though not a direct disavowal of the act, is marked by a friendly spirit. Germany states that no official information concerning the sinking of the Arabic was available, and asks that before taking a definite stand this Government will hear the German side of the case. The most significant clause is the following: "If Americans should actually have lost their lives, this would naturally be contrary to our intentions. The German Government would deeply regret the fact, and begs to tender sincerest sympathies to the American Government."

Italy's declaration of war against Turkey dates from Saturday, on which day the Italian Ambassador at Constantinople presented to the Ottoman Government the formal announcement, together with his country's reasons therefor, as follows: the support given by Turkey to the revolt in Libya and the detention of Italian residents in Syria. This action by Italy was foreshadowed in dispatches of last week which reported at Otranto and other ports a mobilization of fast cruisers and transports headed presumably for the East; and on Monday it was announced that the ships had sailed under sealed orders.

Italy's appearance in the eastern theatre of the war may or may not be taken as the prelude to Rumania's entrance on the same side. Although present indications are that one or more of the Balkan states will soon set aside their neutrality in favor of the Allies, the situation is so complicated that prediction is not easy. Bulgaria is apparently waiting for satisfactory concessions from Servia and Greece, and, though Servia seems ready to accede to the agreement, Greece, at present writing, even with the pro-Ally Venizelos back at the head of the Government, is coyly non-committal. An entirely different outcome of the situation is foreseen in dispatches coming from Berlin to Sayville, which affirm that Turkey and Bulgaria have signed a new treaty, "Turkey granting Bulgaria her desired direct railway connection with the sea, and Bulgaria agreeing to observe a benevolent neutrality, if not more."

By the capture, on Thursday of last week, of the fortress Novogeorgievsk, the Austro-German armies came into possession of 700 guns and a large quantity of war material, took prisoners variously stated at 20,000 and 85,000, and seriously imperilled Russia's second line of defence. On August 23 Ossowetz fell, and now the strong Russian position at Brest-Litovsk is said to be almost untenable. In the north the capture of Kovno has been followed by a fresh offensive on the part of Gen. von Hindenburg with the object of taking Riga and the Warsaw-Petrograd Railway from Vilna northward. This attack was met with stubborn resistance, and a German fleet which entered the Gulf of Riga, to coöperate with von Hindenburg, had to withdraw after suffering severe losses. Between the 16th and 21st of this month, three German cruisers, eight torpedo boats, and one submarine are said to have been either sunk or disabled, while a German Dreadnought, possibly the Moltke, is reported to have been torpedoed by an English submarine.

The presence of this submarine in the Baltic probably explains the destination of another English submarine, E-13, which ran aground on the Danish island of Saltholm, and while in that helpless condition was fired on by a German torpedo boat. It appears also that when the crew abandoned the submarine, they were attacked by machine guns and shrapnel. The survivors have been interned in Denmark, but Danish newspapers profess indignation at what is called a deliberate infringement of neutral territory, and it is probable that Germany will be called upon to explain this action.

If they had come in a week less filled with important happenings, the naval engagements of the past few days would receive first place in any summary of news. Aside from the encounters already recorded, it should be noted that on August 19 five German torpedo-boat destroyers are said to have met a small British cruiser and eight destroyers off the west coast of Jutland, sinking the cruiser and one destroyer. According to the report, which comes from Berlin, the German craft suffered no losses. Also, on Sunday French torpedo boats sank a German destroyer off Ostend, the French Admiralty has announced. Meanwhile German submarines have had a busy week. Leaving out of account the Arabic and Dunsley, already mentioned, they have sunk, since we last wrote, eleven British steamers, one Spanish, two Norwegian, and one Belgian, besides three sailing vessels whose registry is not given in the dispatches. An official statement given out in London places the loss to British shipping in the week ended August 18 at thirteen vessels. Eleven were sunk by submarines and two by mines. Their gross tonnage was 22,970.

A formal declaration was issued by the British Foreign Office, on August 21, designating cotton an absolute contraband of war, and France is expected to make a similar statement. Accompanying the announcement is a proposal by the British Government to initiate measures to relieve the depression which temporarily disturbs the cotton market. And in this country, which is expected to enter a protest against the declaration, Secretary of the Treasury McAdoo has announced that he will deposit, if necessary, $30,000,000 in the Reserve Banks at Richmond, Atlanta, and Dallas to enable them to assist in financing the cotton crop.

A favorable reply to the Pan-American note directed to the leaders of the several factions in Mexico has been received from Villa and Zapata, but it is understood that Carranza is still holding out defiantly. As some difficulty has been experienced in locating the generals of the various leaders, whose assent to the note is desired, the work of the conference is likely to be delayed beyond expectation.

Order was not entirely restored in the Republic of Hayti by the election of a President, which we announced last week. To reinforce the American marines already there, the Navy Department has dispatched the armored cruiser Tennessee carrying the Marine Artillery Battalion, which comprises 350 men and twelve 3-inch field pieces.

The American steamship Dacia, condemned by a French prize court owing to her transfer from German to American registry after the outbreak of the war, has been sold. She has been rechristened Yser and sails under the tricolor.

The letter to ex-Gov. Stokes of New Jersey in which Justice Hughes refused to permit his name to be considered as a Presidential candidate in 1916 was published last week. Justice Hughes states emphatically that his duty to the Supreme Court forbids his entrance into politics.

The Week

A new phase has been put upon the case of the Arabic by the communication sent to the State Department by the German Government on Tuesday, through its Ambassador, Count Bernstorff. This document, which is quoted in part in other columns, is not indeed a direct disavowal of the act, and will no doubt be interpreted in some quarters as a sophistical argument. It will be asked, How, if Germany was bent upon continuing her policy of torpedoing merchant ships without warning, could she have expected that the lives of American citizens would not sooner or later be lost? If the act was contrary to orders received from the Admiralty, why should she not have said so in so many words? But the main point is that Germany has, by this latest communication, shown a desire to maintain friendly relations with this country, and has asked, quite reasonably, that the Government at Washington wait until the German side of the case can be examined before taking a definite stand. The way seems certainly left for a peaceful settlement of the matter.

Names like Delbrück, Dernburg, Harnack, Theodore Wolff, von Donnersmarck are subscribed to a memorial addressed to the German Chancellor protesting against the demand for annexation of conquered territory as one of Germany's peace conditions. In numbers the anti-annexationists are apparently in a minority, but they stand so close to the ruling powers as to raise the question whether the protest has not the sympathy of the Kaiser and his Ministers. The memorial challenges the wisdom of annexation as a general policy, dwells on the difficulties which Germany has experienced in assimilating alien populations, and emphasizes the long heritage of hate which a ruthless policy is bound to leave behind it. There are, of course, immediate considerations, though these are not stated in the memorial. But it must be plain that any tendencies towards peace outside of Germany will be discouraged if Germany lets it be known that she is determined to exact her pound of flesh. It means, in other words, a prolongation of the war, a fight to the bitter end. The annexationists would pretend that Germany can face such a contingency boldly. But we have now some of the best-known names in the empire as evidence to the existence of a very real longing for peace among a large part of the German people.

We speak of the anti-annexation element in Germany as apparently in a minority, because most of the important political parties have spoken out in favor of exigent peace terms. The Agrarian-Conservative forces were the first in the field. The National Liberty Party took an emphatic position. Last week the parliamentary committee of one of the radical parties, the *Freisinnige Volkspartei*, pronounced in favor of future guarantees through necessary territorial expansion. Thus all shades of opinion, from reactionary to radical, and not impossibly a shade of Socialist opinion even, are for a policy of Thorough. But, on the other hand, the great bulk of Socialist opinion is unquestionably opposed to territorial expansion, and the Catholic Centre has not spoken out as yet. Between them, the Socialists and Centrists have a majority in the Reichstag and among the electorate. The jingo element is therefore not so superior numerically as its activity would indicate. The Socialists by themselves would have to be reckoned with seriously, and we may yet see the curious alignment of Socialists with men like the signatories of the protesting petition in favor of moderate terms of peace. It would be a powerful combination.

Problems of war finance have become acute in every belligerent state. They are possibly more acute in Germany than elsewhere, because Germany's war expenses must have far exceeded those of any other belligerent, and because, in Germany, the profits of productive industry must have been disastrously impaired by her exclusion from foreign commerce since the war began. Nevertheless, it would be wholly premature to say that Germany's economic resources are exhausted. Wars have been fought, long before this, on the basis of forced loans, or what is more euphemistically and familiarly known as issue of irredeemable government paper money. To this, as a direct expedient of the state, Germany has not yet resorted. No Government in these days would willingly have recourse to an expedient so discredited, and so certain of bad results in the longer future. But the fact remains that even the most costly war has never heretofore been stopped by the mere inability of a Government to place its long-term loans. Whether, now or hereafter, the demoralizing financial possibilities of the continued war expenditure will induce the German Government to negotiate for peace, is another question. It is one thing to say that a Government can continue to command the resources necessary to pursue a war; it is something different to assume that the people will acquiesce in the incidental burdens. Beyond this, it must always be remembered that this war, with its absolutely unprecedented daily cost and its far-reaching influence on the accumulated wealth of the nations involved, presents in some respects an economic problem new to history.

In France the truce of parties which arose out of the national need with the outbreak of war has been showing signs of strain. The controversy which has arisen over the transfer of Gen. Sarrail from command of the army of Verdun to the army in Gallipoli marks the reappearance of the old jealousies between radicals and conservatives, between clerical and anti-clerical. After the early disasters of the war, Gen. Joffre received a free hand in clearing the army of incompetent general officers. The crisis had to be met. To-day the feeling is apparently that there is no need for summary action, especially in the case of the man who helped greatly to win the battle of the Marne. In this respect the situation resembles the one in England during the unsuccessful drive of Northcliffe against Kitchener. But in France the question is something more than one of personalities. In Paris there has been a general movement for the vindication of Parliamentary authority as against the Cabinet and the high command. The parties in the Chamber have demanded that representatives of the Parliamentary commissions be kept in full touch with affairs military and political, and Premier Viviani has virtually consented. Here we see something of the traditional fear among French Republicans of centralization of power, fear of oligarchy, or, as the extremists would put it, of dictatorship. Germany might point to such party stirrings in France as a cheerful augury for her own cause. But it is just as reasonable to argue that there would be no internal bickerings in France if the menace from the outside were as real as it was a year ago. If defeat were confronting the nation, the claims of parties would not be asserted.

The entrance of the Italian army into the Dardanelles campaign should mean something more than the addition of so many men to the Allied forces—namely, increased efficiency. Given the enormous importance of a large amount of ammunition, the proximity of the source of supply is a factor that counts. From Marseilles to the Dardanelles by the regular commercial routes is about

ten days. From England the time must be near a fortnight. From Brindisi to the Dardanelles by direct transport is three days or less. The landing place for the Italian troops will probably be Enos, well above the neck of the Gallipoli Peninsula. This has the double effect of threatening the communications of the Turks operating in the Gallipoli strip, and, by forcing an extension of their line, weakening the resistance along the present points of contact with the British and French forces. Of further significance is the effect of an extension of the Allied line upon sentiment in Bulgaria. Statesmen may be decided in their course by considerations far beyond the moment. But popular opinion is feeling shaped by tangible facts. The extension of the Allies' line into the interior of Turkey, a close approach to Constantinople, would be a concrete fact powerfully affecting Bulgarian sentiment. As the war moves nearer to Constantinople, to Adrianople, to its own frontiers, Bulgaria's hesitations must come to an end.

The business shrewdness of Henry Ford, and the emphasis he lays upon practical reasons in announcing his crusade against the militaristic propaganda in America, will inspire respect in circles that would be inattentive to an Eliot or a Jordan. His appearance in the lists, moreover, will encourage those who believe that thousands of hard-headed business men like himself feel precisely as he does, though perhaps not with that intensity which his idealistic strain gives him. Why the unthinking should look upon all military advocates as tough-minded men, and all peace advocates as tender-minded, is no mystery. It is easy to label an unwillingness to be scared by bogies as a visionary optimism, and a prejudice against needless burdens and exaggerated "preparedness" as a trait of the mollycoddle. The tough-minded man is the one who looks behind all this throwing of epithets and raising of nightmares, and applies a pragmatic test to the assertions of those who urge arming to the teeth. Mr. Ford plainly admits that he does not know exactly how he will go about his work; but he avows his belief that Americans can be taught "that war does not threaten us, that war cannot reach us, that the fulness of peace is our inheritance, not the burden of militarism, with its heavy hand that curbs liberty, and its foul sustenance upon the blood, the liberty, and the toil-earned happiness and goods of the worker." Such confidence is simply confidence in the penetrating common-sense of the people.

Just when we were being constantly assured that improper practices of railway officials and directors had come to an end, we got so shocking a story as that recently of the looting of the St. Louis & San Francisco. Now we have the true inwardness of the ruining of the Rock Island Railroad by the conscienceless syndicate that plundered it. As in the cases of the Alton and the New Haven, the whole trouble was that the managers exploited the property for their own benefit. No one cared a straw about the rights of the stockholders. The Interstate Commerce Commission traces $20,000,000 wasted in unwise and improper deals "outside the proper sphere in which stockholders had a right to suppose their moneys were invested." Of this $1,000,000 was calmly voted to the officers in the form of gratuities. The crux of the whole thing lies in the attitude of directors like Mr. Daniel G. Reid, who testified that he burns his books at the end of every month, and so could not explain his profits from the various transactions in which he as a director took part, and in the testimony of George P. Boggs, a director and the secretary of the board of directors:

Question: Do you consider that the directors of a railway company, a public-service corporation, have the right to do whatever they please with the money of the railway company?

Answer: As in their judgment seemed right; yes.

Question: Did it ever occur to you that the money in the treasury of the railway company was the result of taxation of the public in passenger and freight tariffs, and that the public had an interest in the funds in the treasury?

Answer: I don't know that I ever thought of it particularly.

Question: And did it ever occur to you that in taking money from the treasury of the railway company, a public-service corporation, an additional burden was placed upon the passenger and freight traffic in order to make good the loss?

Answer: No; I never thought of it in that light.

Question: You don't believe it now, do you?

Answer: No.

Surely, the public-spirited railway men of this country must recognize that it is revelations like this that prevent friendly relations between the public and their roads. It would be extremely wise if railway officials like President Elliott, of the New Haven, President Rea, of the Pennsylvania, and President Holden, of the Chicago, Burlington & Quincy, would jointly let the public know how they feel about these disclosures.

Judge Hughes shows that he is *tenax* as well as *justus* in the matter of a possible nomination for the Presidency. In his letter to ex-Gov. Stokes of New Jersey, he made it plain to his fellow-Republicans that they must give up all hope of having him as a candidate next year. The Judge simply will not have it. He even goes so far as to say that, if nominated in the face of his protests, he would not accept. This seems to be final. And it is no ostentatious refusal of what could not be had. We did not need the Colonel's expression of willingness to accept a Republican "like Hughes," to make it sure that, if the Judge would only silently acquiesce in a movement to nominate him in 1916, it would gain irresistible force. But Mr. Hughes made the great political renunciation when he accepted appointment to the Supreme Court. To his mind, this meant complete devotion to judicial work, which he would never permit the buzzing of politicians to interrupt or impair. However much we may regret this decision, no one can deny that it is a fine example of a lofty sense of public duty. At a time when the judiciary has been exposed to such varied attacks, and made the object of so much suspicion, Judge Hughes appears to have felt that he could perform no greater service than, so far as in him lies, to take one high court out of politics. And we may be certain that he has set a precedent that will long endure. Supreme Court judges have not, in the past, been so scrupulous in putting away political ambition. Chief Justice Chase had so long been an aspirant for the Presidency that he could not wholly give it up even when on the bench. Judge Stephen Field was often talked of as a Democratic candidate, and did not say the party blandishers nay. But hereafter, we believe, the position which Judge Hughes has taken will be regarded as binding upon at least all judges of the Supreme Court of the United States. When men enter that great tribunal of justice, they must abandon all hope of political preferment.

In this year of unparalleled human slaughter it is noteworthy that the committee of the Constitutional Convention to which the question of the death penalty was referred has decided upon an amendment which at least leaves with the jury the choice between death and life imprisonment. This would put New York in line with the bulk of the American commonwealths, twenty-seven of which have such a law. The advocates of the abolition of capital punishment will, of course, be disappointed; they had hoped that New York would be the eighth State to abolish it, particularly as Mr. Osborne has thrown himself so whole-heartedly into their

cause, and his Assistant Warden, Mr. Johnson, who supervised the killing of Becker, is so emphatic in his opposition to any further executions. To offset any criticism as to the substitution of life imprisonment at the option of the jury, the Albany Committee has specified that no one sentenced to life imprisonment shall have that sentence commuted or be pardoned, save on legal proof of his innocence. This is a complete answer to those who oppose life-imprisonment on the familiar ground that "a 'lifer' almost never serves out his term."

"About this time, begin to look out for the Committee of One Hundred." Thus might read a line in any accurate Philadelphia almanac for August, 1915. The contractor-politicians have recovered from any dismay they may have felt when Blankenburg was elected four years ago, and seem to be prepared to take the bold step of nominating for Mayor one of the notorious Vare brothers. The machine is divided now as then. The Penrose-McNichol part of it is no more favorable to Vare's candidacy than it was in the last campaign, and has suggested name after name in a hunt for that much-desired "harmony" which went to pieces in 1911. But the Vares are uncompromising. They see a chance to "come back." Penrose won in the primaries with Earle four years ago, but lost the election. Why should not the Vares face the primaries again as contentedly as their party rivals? Meanwhile, steps are being taken to bring about a new fusion among the opponents of both their houses. Beginning with the Washington and Democratic City Committees, the Committee of One Hundred plans to weld into a single organization every independent political force in the city. The problem will be to select a strong candidate who is acceptable to the diverse elements behind him.

Leo Frank's lynching convulsed the country, but a day later three negroes were lynched in Alabama, and the event passed unnoticed. What was the terrible crime of these black men? They had been "accused of poisoning mules"! Held by the authorities on that charge, of which it would seem there was no proof, they were let go, only to be murdered by a mob. It is all of a piece with the lynching of Frank. The fearful thing is the spirit of utter lawlessness and brutality; the victims of it do not signify, except as now and then a case of exceptional ferocity acts as a lightning-flash to show to the nation the abyss on the edge of which it has been standing. What we have to reckon with, and what we have to fight, is a monstrous state of mind. We have allowed infuriated men to believe that they are right in brushing aside judges and juries and the officers of the law, and making themselves the instruments of vengeance. A man named Crum, a citizen of Tennessee, was recently lynched in Arkansas. The Memphis *Commercial-Appeal* had a letter from Osceola, Ark., signed "One of the Executioners of Crum," in which the writer boldly took the ground that he and his fellow-lynchers "did not propose taking any chances" of having Crum tried in court for his alleged crimes. This is the barbarism, naked and unashamed, which inheres in all lynching. As it is a direct blow at civilized society by savages, civilized society has to gird itself in defence against this irruption of cave-men into the modern world.

If we are sending destruction to Europe in the form of munitions, we are also doing our best to care for her culture. At regular intervals, our fellow-citizen, Walt Mason, who gets his mail at Emporia, Kan., forwards to the London *Chronicle* one of his characteristic effusions. There they appear under the head, "War Lyrics." A recent one was entitled "A Hymn of Hate." Mr. Mason bears no ill-will against "the greasy Turk who stabs me with a rusty dirk. He thinks he is within his rights, he acts according to his lights." He does not bear a grudge against even "the howling Hun who shoots me with his ten-foot gun." What roughens his spirit is "the fraud who loudly rants of virtue while he drowns my aunts." If anybody in England can write like this, he has carefully concealed his ability. Only our own poetry-factories are capable of turning out this product. Fairness would require that it be shipped to both sides in the war, with, of course, such changes as would adapt it to the respective sensibilities of its several recipients.

The latest list of Prussian losses brings up the total to exactly one and three-quarter millions, according to a Copenhagen dispatch, which then proceeds to estimate the losses for the whole Empire at three and three-quarter millions. This is like the undergraduate's expense account, which itemizes $250 and adds a thousand dollars under "sundries." The casualties for the non-Prussian states of Germany may be safely estimated at about one-third the Prussian wastage, so that on the basis of the published lists the casualties would run up to 2,300,000; and if we remember that the lists are always in arrear, the German losses at the present moment may be placed at about two and a half millions. These figures are very nearly confirmed by the estimates made by a member of the British General Staff about a month ago in connection with certain proceedings in the prize court. Major Dillon reckoned the German wastage then at about two millions, describing his figures as probably an underestimate. With a monthly loss of about a quarter of a million, owing to the grand sweep of German operations, we obtain virtually the same results as the published lists would indicate.

More impressive than the drain of actual casualties are the figures illustrating the strain involved in Germany's mighty efforts to raise and maintain her armies. The German trade-unions published at regular intervals figures of the union members summoned to the colors. In July, 1914, the union membership numbered 2,300,000, or one-fifth of the total male wage-earning population between seventeen and sixty. By last May, 45 per cent. of the union membership had been mobilized. By now the rate is probably near to 50 per cent. In other words, of the 11½ million wage-earners, more than five million have been brought under the colors. Applying the same ratio of 50 per cent. to the five million German males of the professional, learned, official, and leisured classes, we get another two and a half millions, which would make a total of more than seven and a half millions. These figures are confirmed by the statistics for aid rendered to dependent families in Berlin, which would show that Berlin has sent 220,000 men to the war, a ratio which for the whole Empire would give 7,414,000 men. Finally, add the standing army at the outbreak of the war, about 880,000 men, and you obtain a grand total of 8,300,000 men in service. Subtract the casualties, with allowance for the return of the less seriously wounded, and you get six and a half million men. Deduct further about three-quarters of a million men still in training and the garrison troops in the interior, and you get about five million men as the present fighting strength of Germany. As for the remaining working population, from the five and a half million workers between seventeen and sixty, we must subtract the men engaged in serving the needs of the war, estimated at more than three millions, so that about two and a half million workers are left to supply the general needs of the Empire.

OUR RELATIONS WITH GERMANY AGAIN IMPERILLED.

It is needless to heap up words to show how critical is the situation caused by the latest German outrage at sea. The facts in the matter of the torpedoing of the Arabic speak for themselves. The whole tale is not yet told, but enough is known to prove that the commander of the German submarine acted in defiance of the distinct warning given by President Wilson in his last note to the German Government. For this it is possible that the German authorities may apologize. The first step taken by Washington would naturally be to demand such an apology. It has all along been a peril to our friendly relations with Germany that they were left at the mercy of some hot-headed or blundering lieutenant of the German navy. If the officer in command of the submarine which sank the Arabic, without warning and without pity, exceeded his instructions or disobeyed positive orders, Germany should promptly disavow him and offer amends. She should quickly receive the chance to do so, in order that she may not be able to say, as the *Frankfurter Zeitung* said of the commander of the submarine which sent the Lusitania to the bottom, that it was impossible for his Government to disavow an officer whom it had already praised and rewarded for the very act in question.

It is a hideous business, this sinking of passenger ships at sea, whether American interests are directly involved or not. It is a clear violation of the rules of civilized warfare. It is an indelible blot on the reputation of a country guilty of it. That in this instance nearly all the passengers and crew escaped with their lives does not in the least affect the moral or even the legal character of the act. Between a murderous assault that fails and one that succeeds there is no ethical difference; there is very little difference in law. The outrage and the lawlessness are the same, whether one life was lost or one thousand. Either way, it is a thing to be denounced by all humane men. But the American Government has, of course, no occasion to move in the affair determinedly, unless American rights were violated. Were they?

Notice, in the first place, that none of the pitiful excuses advanced in the case of the Lusitania can be applied to the Arabic. She was sailing west, not east. She had no war munitions on board. There is no room for the lame theory of a secondary internal explosion to account for her sinking so quickly. It cannot be alleged that Germany was saving the lives of her own sons by destroying a cargo of guns and shells destined to her enemies. To be sure, the convenient but damnable doctrine of "military necessity" might be pressed into service. The Arabic was sailing to bring back more ammunition, therefore it was the same as if she had it in her hold! This argument would, obviously, justify the murder of any one engaged in the preparation of war supplies, all the way back. Germany could assassinate men in our mines or mills and then say, with as good a grace as in the case of the Arabic, that it was "necessary" in order to prevent bullets or rifles from being used against German soldiers.

Americans were on board the Arabic, as they had full right to be. Two of them were lost, and the lives of other Amercians "put in jeopardy" by the submarine attack; that was the phrase which President Wilson used in his solemn warning to the German Government. Were these Americans few or many, in the second-class or in the steerage, the duty of our Government to protect them in their rights, and to assert the full measure of our dignity as a neutral nation, remains unquestioned. And apart from President Wilson's notification, which was explicit enough, the German Government had ample reason to know that another event like the Lusitania would bring on a crisis with this country. The expressions of the American press left no doubt of that. It is also generally understood that from the German Embassy in this country, and from other sources of German information, Berlin was plainly told that if a war with the United States was wanted, the surest way to bring it on would be to go on sinking merchantmen with Americans on board.

Now, that Germany really desires war with this country, we have never believed and do not now believe. Nor do the people of the United States wish to go to war with Germany. Unhappily, the relations of two nations sometimes become hostile without any real popular animosity on either side. And that the still unsettled controversy over the Lusitania, with the perilous question of the Arabic now added to it, constitutes something like a crisis, it would be in vain to deny. It is to President Wilson that his countrymen will now look for the right leadership. All the dispatches from Washington agree that, while he is greatly concerned, he has not lost poise or calm. He will first ask for all the facts. Then he will come to his decision. No one imagines that he will for a moment think of retreating from the positions deliberately taken by him in his official communications to the German Government. The only question is in what way he will fulfil his pledge to omit no word or act to uphold the unquestioned rights of Americans on the high seas. If the whole truth about the Arabic shall make it evident that her torpedoing was what the President described in advance as a "deliberately unfriendly" act, then our relations with Germany cannot, without apology and reparation from her, remain friendly. In that event, and in case the German Government gives us no satisfaction, the probability is that we shall see what has so often been talked of in Washington—namely, the recall of Ambassador Gerard and the withdrawal of Ambassador Bernstorff.

COTTON AS CONTRABAND.

Great Britain's decision to declare cotton contraband of war was evidently come to very reluctantly. The Government yielded only to great pressure. This was partly military, partly popular. And it was strengthened by the public utterances of English scientists, like Sir William Ramsay, who pointed out the indispensable part which cotton plays in the manufacture of high explosives. To keep supplies of it from reaching Germany was, therefore, it was argued, the same thing as keeping from the enemy munitions of war. But this is no more clear to-day than it was a year ago. Why was not the step taken then? Why did Sir Edward Grey give assurances not merely that cotton had not been placed on the contraband list, but that it would not be?

The explanation is to be found in a variety of motives. England was anxious to avoid disturbing the export trade of the United States. She was also desirous that the neutral countries of Europe should receive their normal supplies of American cotton. There were thus trade reasons and also reasons of diplomacy why Great Britain hesitated. And the Government must also have been unwilling to reverse the historic British position respecting cotton as contraband. When Russia, at the time of her war with Japan, declared cotton contraband, the English Government made a vigorous protest. This did not avail, to be sure, but it served to put Great Britain on record. So did the Declaration of London, which enumerated cotton among the articles which should never be declared contraband. To this the British delegates agreed, though the Declaration was not afterwards ratified by

Parliament and is not regarded by our own Government as binding. Still, the British attitude has been so clearly defined in the past that the present abandonment of it must be a bit awkward for the Government. Of course, it can say that military necessity has compelled it to change its mind, but this somehow sounds like learning from the enemy.

American precedent has been cited for this English action. In our Civil War cotton was held contraband. But the two cases are not at all parallel. This was admitted in advance by Professor Holland, of the chair of international law at Oxford, when the protest against Russia's declaring cotton contraband was under discussion eleven years ago. He asserted that examination of the alleged American precedent would show that it had "no bearing on the question under consideration." The reason is plain. The North did not treat Southern cotton as if it had anything to do with munitions of war, except in their purchase. Cotton was the equivalent of money to the South. For that reason, it was classed among war supplies. As Secretary Bayard wrote long after in explanation: "Cotton in fact was to the Confederacy as much munitions of war as powder and ball, for it furnished the chief means of obtaining those indispensables of warfare." This is obviously very different from seizing cotton because it is an ingredient of explosives. The effect in the two cases may be the same, but the reasoning is unlike.

Many vexing questions arise in connection with contraband. Cotton is only one illustration. The fact is, as Prof. John B. Moore states in his pamphlet on "Contraband of War," the law of contraband is not settled. Can a belligerent declare anything it pleases contraband? The old contention was that it could. The right was supposed to be a part of a nation's "sovereign" power. But this is not now conceded. The general rule is held to be that "no extension of the contraband list can be made by any one sovereign to the detriment of all the rest without their consent." But how to get their consent? There's the rub. Despite all the efforts to obtain an agreement at The Hague and at London, the question of contraband remains, as Professor Moore puts it, "unsolved." It is one of the things which international Congresses will have to wrestle with after the war.

What recourse has a nation which believes that the inclusion in the contraband list of an article like cotton is a "detriment" to it? It can, first of all, register its protest. This the United States did at the time when Russia made cotton contraband. Our Government urged that there should be "no relaxation" of the established distinctions with regard to contraband, and that the one criterion to maintain was "warlike usefulness and destination." But to-day, of course, England will assert precisely that warlike usefulness in respect of cotton. Yet it is to be expected that Washington will nevertheless file a protest at London, which will look forward to possible claims for damages, after the war is over. This is the second remedy which a neutral nation has. It can also appeal to treaty agreements. Our treaty with Great Britain of 1794 would appear to give us clear ground for indemnification, in case cotton cargoes are confiscated. But all these questions, with the actual effect on our export trade, must remain for the future.

THE GERMAN BLOWS AT RUSSIA.

Of the great fortresses in Poland, only one, Brest-Litovsk is in Russian hands, and any day may bring news of its fall. The fall of Warsaw had more political than military significance. The conquest of Novogeorgievsk, while a brilliant feat of arms, had only a secondary meaning, since the tide of battle had surged far beyond the fortress, and its reduction was in the nature of a cleaning-up operation. With the fall of Kovno, on the other hand, there went down not merely a great fortress, but the northern pivot of the line to Brest-Litovsk, which was generally regarded as the second line of Russian defence. The Germans are in a position to assert that their deeds supply an immediate commentary on the boasts of the Allies. While people were reading the Russian Minister of War's apologia, his insistence on the line of the Bug and the Niemen as the real line of Russian defence, while he was emphasizing the failure of the Germans around Kovno, that place was already in German hands. With Brest-Litovsk it may be a question of hours. The line of the Niemen and the Bug is virtually gone. The question is where next the Russians can rally, if they rally at all.

If the Germans are not content with the new line along the Bug and the Niemen, if their object is to press forward until the destruction of the Russian armies is accomplished, we may take it that the aim will be not to throw a ring around the Russian armies, but to break the connection between the Russians in the north and in the south. A complete "encirclement" seems impossible on so vast a terrain. But if the Russians from Brest-Litovsk south to the Galician border can be separated from the armies falling back from the Niemen, the process of disorganization will have been notably advanced. If, on the other hand, unity of the Russian forces is to be maintained, it means a further retreat to the line from Vilna through the Pinsk marshes to Rowno in the south. Along this line there is railway connection. If Vilna goes, as seems not unlikely, a further retirement in the north becomes necessary until the Russians stand along the railway running from Minsk, to the west of the historic Beresina, southwestward to Pinsk and Rowno. In this position the Russians would still have railway connection with Petrograd, behind them would be the line to Moscow, and in the south the railways to Kiev would be intact.

Such a retreat involves difficulties. It means a retirement through great stretches of swamp land, with few roads and consequent strain on the railways. But this line once attained, it is doubtful whether the Teutons' drive would press it hard. The deployment of their forces would be hampered in turn by the unfavorable ground, their lines of communication would be enormously extended—Minsk is 215 miles from Brest-Litovsk—and time, which must still count in the German scheme, would run heavily against them. So that a close pursuit of the Russians far beyond the Bug is not very likely. To have driven the Czar's armies so far into the interior might be regarded as reducing them to comparative helplessness. In the north the attack might be pressed against Riga and Dwinsk, with the suggestion of a threat against Petrograd. On the greater part of their line the Germans would seemingly be at liberty to turn their attention to the Balkans, Italy, or France.

The question is whether the Russians, pushed so far back, can really be reduced to a point where they no longer count. Opinion in the Allied capitals is that they can always constitute a sufficient menace to keep engaged the great bulk of the German troops now massed in the east, and that, while the increase of German strength in the west may be considerable, it cannot come with sufficient force to threaten the Allied position there. This is not over-optimism. It is possible to draw a parallel between the situation to-day and in 1870-71. If we think of all Europe as a single theatre of war, corresponding to the France of forty-five years ago, then the great siege

operations in the west to-day may be thought of as corresponding to the siege of Paris in 1870-71, while the rôle of Russia to-day would be that of the French armies in the provinces. We know how busily employed the German generals were kept by those raw levies, whose ultimate defeat was certain, but who nevertheless gave Moltke many an anxious moment around Paris. We know how large a part of the German forces were diverted to the campaigns in Normandy, in the north, and around Belfort. Until total disorganization befalls the Russian armies, their influence on the main theatre of war will continue to be felt.

THE FIASCO OF THE INDUSTRIAL COMMISSION.

The Federal Commission on Industrial Relations expired by limitation on August 23. In public esteem, it expired long ago. In fact, it may almost be said to have died a-borning. This was partly on account of the nature of the task set it, but much more because of its personnel. The appointments to the Commission were not such as to do credit to President Wilson's information or his perspicacity. Two or three of the members were fit for their job, but the rest speedily showed that they were not. And the Chairman, Mr. Walsh, promptly seized the earliest and every occasion to advertise himself as a blatherskite. The fated result we now see. The Commission broke up in total confusion. There were nine members, and at least ten different opinions. No general report could be agreed upon for submission to Congress. Each Commissioner had to go it alone, or else be one of several small groups to sign separate and conflicting findings and recommendations. And in this multitude of counsellors who were quarrelling with each other, Congress expected to find wisdom!

We referred to the difficult duty assigned to the Commission, at the time of its creation. This was of a sort to test the skill and judgment of the ablest men in the country. Even they might easily have failed, except as they reached a few cautious and tentative conclusions. For who could be bold enough, and sufficiently sure of himself and all the facts, to assert that he had positively isolated and identified "the causes of industrial unrest"? Who could be so cocksure as to believe that he had discovered the appropriate and infallible remedies? To a man like Walsh, to be sure, all this seems ridiculously easy. All the knots in our industrial and social system he undertakes to unloose, familiar as his garter. But to sober inquirers and open-minded students, the whole problem is too vast, and at the same time too delicate, to be attacked by the methods of a country lawyer or an agitator. They know what labor, what patience, what racking of the brain must precede fruitful results in even a small portion of the extensive field of this investigation. Hence it is not strange that the cooler-headed members of the Commission refused to follow the vagaries of the heated Chairman Walsh. He accepted as gospel truth any statement of fact which any employee of the Commission chose to make. But Professor Commons and one or two other Commissioners with him pointed out that "the recommendations of investigators for the Commission are one-sided and incomplete, as they were not submitted for verification to the persons directly interested." One can imagine the scorn of Walsh for this idea that verification is necessary of anything which he has the will to believe true.

"Disappointing" is the word applied by the Chicago *Herald* to the final disagreement and disintegration of the Industrial Relations Commission. If these nine wise persons cannot tell us what is wrong, and how to right it, "what can the poor public do?" It is inferred that Congress will be much cast down at the failure of the Commission to lay before it a list of neatly catalogued industrial evils, along with cut-and-dried remedies for each. The consequence is that Congress will have to fall back on its own knowledge and conscience, and that is truly an appalling prospect. But it may be doubted whether the most sagacious Congressmen ever looked for any very definite benefits at the hands of the Commission. To create it was a convenient way of referring and delaying a matter on which it was hard, and perhaps unwise, to lay down a general public policy. Hence they may have been actuated by something of the motive expressed in the cynical saying of Lord Salisbury, that often the best way to dispose of a troublesome question was to let it die by means of a Royal Commission. For two years, at all events, Congress has let the Commission wrestle with the problem of industrial unrest; and if, in that period, it has done anything but muddle things up and add to the said unrest, the fact does not appear in any of its reports or in the impression which it has made upon the public.

We would not deny all value to the Commission's work. Several of its public hearings have been instructive. We believe thoroughly in the plan of getting men of different views together and letting them give the reasons for the faith that is in them. Inquiry and publicity are indispensable in all these matters. And even the speeches and the cross-examinations of Chairman Walsh have educated the public—in the way not to do it, and in the beliefs not to be accepted. When, however, one takes up seriously the previous reports of the Commission, and observes the confusion and bickering into which it has fallen at the end, it is hard to resist the conclusion that the whole affair has been a fiasco. The original idea of an investigation had much to commend it. Judiciously limited and placed in competent hands, it might have been of real help. But the thing was done otherwise; and about the only result of value, the chief lesson to the public, is the demonstration we now have that complete wisdom cannot be acquired in a day by those who have not at least a modicum of it to start with, and that the world cannot be set right by men unable to set themselves right.

"VILIFYING" A STATE.

To Gen. Sherman is credited the statement that he preferred never to give his reason in advance for any military operation he set on foot, because he might think of a much better reason when it was all over. The behavior of a large part of the people and the press of Georgia with regard to the nation-wide protest against the Leo Frank horror reveals the same process of reasoning by after-thought. Whether the dreadful deed is defended or merely explained away or only palliated, the argument has become standardized: it was the attempt of "outsiders" to dictate to the people and the Commonwealth of Georgia that is really responsible for the Frank tragedy. Apparently, a proud people was stung by outside meddling into convicting a man whom it otherwise might have set free, or putting him to death when the State's own will as expressed through one of its coördinate legal powers gave the man his life. So now to-day, when the question is what the people of Georgia will do to repair the shame that has come upon its laws, the same outcry against outside dictation goes up. Leave us alone, and we will see what we can do. "We feel warranted," declares the Atlanta *Journal*, which believes in Frank's innocence, "in saying a word to those scornful and rabid outsiders who are vilifying Georgia in sheer malice and are manifesting a spirit as violent and evil as that of the mob itself." It is the afterthought reason. If the people of Georgia did not feel that some excuse was

necessary, this pretence of dictation from the outside would not have been thought of.

No one of consequence has assailed the "entire people of Georgia," as the Atlanta *Journal* professes to believe. No reasonable person has "vilified" the State of Georgia. The State, as a political entity, did not lynch Leo Frank, did not even decree that he be put to death. It is true that the courts convicted and sentenced him, but the Governor of the State, in the exercise of his constitutional powers, granted the man his life. So far as the will of the State of Georgia was expressed through the counterbalancing action of the courts and the reprieving power, it was that Frank's life should be spared. Had that will been allowed to prevail, the Frank case would have brought honor instead of disgrace to the commonwealth; for it would have shown that on an issue over which popular passions were whipped into fury, in the face of the clamor of the mob for the death of Leo Frank, the sober thought of the Commonwealth speaking through its official representatives had prevailed.

What has really happened is that only a part of the people of the State, and probably a minority, has identified its own prejudices and acts with the State. When the conscience of the nation protests against the action of the Marietta mob, we are told that it is an assault upon the honor of Georgia. What is this Georgia beneath whose ægis the lynchers and their apologists are sheltering themselves? It is a convenient label. People who speak of the shame of Georgia do not mean that a certain iniquity pertains to the people within the boundaries of the State and ceases abruptly as soon as you cross the border into South Carolina, Alabama, or Florida. They are thinking of a fairly definite group of people who have perpetrated a definite outrage and who happen to live within the limits of the State of Georgia. No one is vilifying the State as a whole, because this at present is the very question: whether the State as a whole will identify itself with the Marietta criminals, or whether, by taking appropriate action, it will show that in denouncing the Marietta mob one is not vilifying Georgia. The surest defence of Georgia against vilification is for the State, speaking through its legal organs and its better citizenship, to express the same abhorrence of a criminal act that the "outsiders" have expressed.

And who were some of these "outsiders"? The United States Supreme Court was one of them. To have appealed to Washington was an infringement on the rights and dignities of Georgia. Judges and eminent lawyers of other States, who, from a study of the case, were convinced that injustice was being done and protested, were outsiders. Can Georgia really expect to surround herself with a Chinese wall of indifference to "outside" public opinion? New York, in the same way, might have protested against invasion of her dignity during the long years when Tammany was a national by-word. Philadelphia, during her long fight against corrupt politicians, should have resented the attention which the struggle drew from the press of the entire nation. No such insistence on her self-sufficiency comes from Georgia when it is a question of bringing outside capital into the State, or outside help into her educational institutions, or outside Federal assistance in marketing her cotton. On such occasions Georgia is willing to acknowledge herself a member of one great community. Can she afford to call up States Rights only for the defence or exculpation of an outrage against humanity and her own laws, as if lynching were another "peculiar institution"?

THE WAR AND THE AUTOMOBILE.

In dwelling the other day upon the difference between campaign conditions in Russia in Napoleon's time and to-day, Gen. von Bülow, one of the German commanders, pointed out particularly the changes in means of communication. Whereas Napoleon had to live on the country, or be supplied by convoyed wagon-trains over incredibly bad roads, to-day there are not only railways, but thousands of motor trucks, for whose use asphalt roads can be made to "grow as it were out of the earth." Beyond doubt, no recent invention, not even the aeroplane, has so affected the development of war as has the automobile. The first rush of the Germans into Belgium was facilitated by endless lines of motors, and the most striking military achievement of the war, the winning of the battle of the Marne, was made possible by the bringing up from Paris overnight in taxicabs and omnibuses of a fresh army of whose presence von Kluck was not aware until it compelled his hasty retirement.

Every sort of automobile has been requisitioned or constructed. There are ambulances, of course, galore; there are also bathhouses for the men, on four wheels, laundries, field- and soup-kitchens, sterilizing rooms, X-ray and bacteriological laboratories built on the ordinary chassis of trade or of pleasure—yes, the French have even little operating "theatres" that move to the wounded men instead of their being brought to the surgeon. The hastily armored cars of which we heard so much in the early days of the war have shown that they are of great value, but, so a British writer points out, are none the less dangerous because of their inability to turn quickly, particularly in narrow roads. There are even ladder-cars in use in the French army for purposes of observation; the instant they stop, a ladder is run up for the observer to climb. For dispatch carriers and scouting the automobile has proved its usefulness, as is shown by the multitudes of wrecked vehicles that litter the fighting-ground. It is even suggested that military motors hereafter be "double-enders," so that they may go in either direction without stopping to turn.

As for the automobile industry, it is one of the few that have profited immensely by the war. Some of the French manufacturers have divided their activities between turning out military cars and shells, the Government refusing to let them go on with their private business. But it is quite characteristic of the temper of the French people that these companies have not ceased their scientific development of the automobile. According to an American who has been watching the industry there, designers and experimenters have gone steadily ahead turning out new devices and improvements just as if there were no war raging. In England the industry has had an enormous boom. The English builders had gone further than any one else in the production of motors especially intended for the haulage of goods and for the conveyance of passengers in considerable number. The excellent British roads and the natural inclination of the British engineer to build machinery of a heavy and durable character have both tended to put the English ahead in the production of traction engines and heavy lorries. Certainly one sees nowhere else such long trains of wagons pulled by an engine—at times resembling the original steam engine—as are found in England.

It was not, of course, possible for the British to supply their Government's needs at the outbreak of war. Enormous orders were therefore placed in this country. The British builders of automobiles are now probably being mobilized under the Munitions act, as were the French at the outbreak of war, but even this speeding up of their production will not make it possible for them to

keep up with the need. Hence there will be a demand for trucks from this country as long as the war lasts. That this will have a favorable effect upon our truck business goes without saying. Marvellous as has been the development of our motor-vehicle business, the truck end of it has lagged far behind. The war has given an opportunity, therefore, to American designers and builders along this line which will furnish them with a knowledge and experience of the utmost value in the years to come. So obvious is this fact, that there is already great unrest in England, where the automobile industry has heretofore suffered from American competition only by the introduction of the Ford and similarly cheap cars. Thus the week before last a protest was organized in London against the purchase of American automobiles during the war, particularly while British manufacturers are at a disadvantage because their plants are turning out war contracts under pressure for certain types. Writing in the *Quarterly Review*, Horace Wyatt, a British authority, expresses great alarm upon this same point. He fears that during the war British manufacturers will have lost neutral markets under circumstances bound to tell heavily against them, for the necessity of maintaining a substantial output for the Government requires the purchase of great quantities of raw material a long time in advance at inflated prices, while the Government reserves the right to terminate any contract at the shortest notice. Meanwhile the British makers are, of course, wholly unable to supply the English demand for private vehicles.

What worries Mr. Wyatt even more than this is what will happen at the close of the war, when thousands upon thousands of second-hand lorries and cars will presumably be sold at auction at very low prices. Many of these will go into commercial service in a damaged condition, for the army or navy chauffeur has no time to keep his car in good condition; he simply flings it away and applies for another when it becomes unworkable. Mr. Wyatt feels that the slightly damaged cars when they return to the hands of the public will earn for their makers an unenviable reputation, besides preventing them from selling new products by reason of their flooding the market. He hopes, therefore, that the Board of Trade and the new Ministry of Munitions will devise some way of preventing the sale of these cars in bulk when the war is over, and will officially aid the industry to get on its feet again and compete with foreign makers anew.

Foreign Correspondence

AFTER ONE YEAR—THE SUBORDINATION OF THE INDIVIDUAL—HOSPITALS FOR HORSES—HENRY JAMES.

By JAMES F. MUIRHEAD.

LONDON, August 4.

It has been Germany's good fortune to be able, in a sense, to capitalize some of her less worthy qualities (over-docility, lack of individual energy or initiative, blind obedience, respect of persons) into a fund of unselfish devotion for the service of the State, while some of our best qualities (self-reliance, individual enterprise, sense of independence) have rather tended to disunion and selfishness, and need to be effectively curbed. I presume that, if it were feasible, the ideal system for a country at war would be a pooling of the national income and a redistribution of it on a basis of relative national service, with only such regard as was absolutely necessary to previous services and standards of living. All flaunting of wealth should be tabooed; sumptuary laws of every kind should be enforced. The sprat must be unhesitatingly sacrificed for the whale. It must be more and more clearly understood that normal ideals of comfort and liberty must be "scrapped" in abnormal times; that we must be ready to suffer practically anything during the short-lived present in order to make the endless future endurable. In their inability and unwillingness to realize this necessity, the selfish egoist and the doctrinaire idealist join hands, and thus are of almost equal danger to the State.

Yet it is certain that conditions of war mean self-denial in moral luxuries as well as in others. Surely it is a supreme tragedy that the man who hitherto would not have harmed a fly has now deliberately to face a situation in which he feels it is imperatively right for him to wish the death of other human beings, either by his own act or by proxy. What sacrifice is it to put down your automobile or give up dinners in restaurants and new frocks, compared with the horror of accepting this crimson stain on your soul? And millions of good men and women in Great Britain have had to accept this ghastly "no-solution" of the moral problem of life. Woe unto those, whoever they may be, who are ultimately responsible for this compulsory degradation of the finest feelings; who have imperatively limited our moral activity to a choice of evils; who have not only said "Evil, be thou my good," but have unavoidably imposed the same law (so far as practical action goes) on those who hate the devil and all his works.

In the July issue of *Our Dumb Animals* (Boston, Mass.), I read these words: "Regard for all laws, human and divine, has ceased on the part of both hostile armies. Each is ready to stoop to any barbarities the other may put in practice." This rather hasty and unguarded statement is open to objections on many different lines; but one of the most obvious and utter refutations of it is the noble work now being done by the Royal Society for the Prevention of Cruelty to Animals in conjunction with the Veterinary Corps of the British Army. Though this is so largely a war of mechanical haulage, it is estimated that there are at least one million horses employed at this moment in the armies of the various belligerents. The experiences of the Boer War showed the very unsatisfactory state of the organization for the care of horses in active service, and the Army Veterinary Corps was established in 1903. During the present war, this corps, consisting of about 700 officers and 8,000 men, has received most valuable assistance from the R. S. P. C. A., which is the only society authorized by the Army Council to raise funds for the provision of hospitals and other requisites for the horses in the field. The expenditure of the money thus collected is under the direction of the War Office, and Mr. Edward Fairholme, the chief secretary of the R. S. P. C. A., has been made an officer of the Army Veterinary Corps. There are now, in all, fifteen veterinary hospitals on the lines of communication or at the bases of the British army, two of which, with accommodation for respectively 1,250 and 1,000 horses, have been established with the contributions of the R. S. P. C. A. A third, to accommodate 1,250 horses, is in progress of construction. At the time of the latest returns 81,134 horses had been treated in these hospitals, with the result that 47,192 had returned to duty, 9,109 had died or been killed, and 22,991 remained under treatment. The staffing and equipment of these hospitals are as complete in their way as those of the hospitals for men, down even to hay-stuffed operating beds, on which chloroformed patients subside gently into a comfortable unconsciousness. Each patient is subjected to the Mallien test for glanders, and is then sent to the surgical, the medical, or the infectious ward as the case may demand. Pneumonia patients are isolated in loose-boxes, and a white tape round their necks indicates that they are not to be disturbed or taken out to water. The idiosyncrasy of mules is recognized by the provision of sand baths for their use. Local anæsthetics are employed for painful dressings. Just as many of the men at the front are better fed and cared for than they have ever been in their lives, so many of the convalescent horses, turned loose in a lush French pasture, are enjoying hitherto unknown delights. It is even asserted (I give the statement for what it is worth) that some of the coal-horses, accustomed all their lives to stuffy stables and artificial feeding, have actually to learn how to crop grass.

Motor and other ambulances have been among the most valuable contributions of the R. S. P. C. A., as they enabled wounded, sick, and tired horses to be transported with a minimum of distress. At one of the ports where large numbers of horses are landed, the steep hill which they needed to climb from the wharf to the veterinary station was found to be a real death-trap to horses that had contracted chills or pneumonia during the voyage. The Cricklewood Home of Rest for Horses, a daughter society of the R. S. P. C. A., provided a double motor ambulance for the comfort of these feeble knees, and the cost of this (£900) was saved in its first week's work. The society is able, in many other ways, to relieve the sufferings of the horses, largely through its ability to provide additional comforts and alleviations not prescribed on the military establishments. Its representatives report that the general treatment of the horses used by the army is as humane as the circumstances admit of, and that cases of mishandling are very severely dealt with. The society's educational work includes the giving of special lectures on the care of horses to N. C. O.'s and other soldiers. Altogether it may be truthfully

said that the claims of the horse to kind and considerate treatment have been recognized and provided for in this war, in a wholly unprecedented manner. If, as Mr. Galsworthy says, "we do violence to horses by employing them at all in this deadly business" we are at least doing our best to minimize the evil. The economic results have been as satisfactory as the humane. The figures already given show a marvellous improvement on the 66 per cent. of loss in the Boer War; and it has been estimated that the German cavalry use up at least three horses to our one, from want of care in unsaddling, removing harness, and feeding. The Boers used to catch our cast horses and restore them to condition for their own use; but there is now no waste of this particular kind in the British army.

Two personal incidents, one connected with an American in England, the other with an Englishman in America, have recently excited some interest here. The naturalization of Mr. Henry James as an English citizen has touched us all. Here and there, there has been an attempt to read into this action a measure of criticism of Mr. James's native country; but the general feeling neglects this possible negative aspect, and looks upon it merely as a loyal expression of sympathy with an old friend in distress, and of admiration for that friend; bearing of the strain. We remember that earlier in the war he wrote: "This grand old country has found herself again . . . at this hour she is in a perfectly magnificent moral position, the proudest, to my mind, of her history." In spite of his long residence in England and his deep regard for that country, Mr. James seems hitherto to have been unwilling to sever the ultimate ties with his old home; but now he apparently realizes that there can be no misconception of his real feeling when he transfers his spiritual treasures from the secure homestead to the harassed and menaced fortress. The garrison of the latter, at any rate, regards his adhesion as a marvellous compliment, and welcomes the new recruit with all its heart. "Harvard, of Harvard," has also found his way from the *Harvard Bulletin* to the English press; and the romance of his career has excited considerable interest in this latest recruit for the British army. His name seems of happy augury to the friendship between England and America; and it is believed that his American training will, without impairing his patriotism, help him to take the widest possible view of the cause for which he is about to fight.

THE WAR'S ANNIVERSARY—LEST WE FORGET.

By STODDARD DEWEY.

PARIS, August 7.

This first week of August has been given up to remembrances of a year ago. I wonder if those days, in history written after us, will not be reckoned weightier for the world's civilization than Alexander the Great's journeying from Pella to Granicus or Cæsar's crossing the Rubicon; dearer even than the New England day when,

> Their flag to April's breeze unfurled,
> Here once the embattl'd farmers stood,
> And fired the shot heard round the world;

or when, a first time, the tramp of the French Revolution crossed the Rhine:

> God said, I am tired of kings,
> I suffer them no more.

Perhaps, here in France, the people are counting too soon on peace that shall be worth such cost of war; but in their confidence is the spirit of great times once again:

> For He that worketh high and wise,
> Nor pauses in His plan,
> Will take the sun out of the skies
> Ere freedom out of man.

Yes, freedom from German "organization" in a conquering war-machine inspires France in this war.

One daily chronicler from the beginning of war—"Polybe" of the Paris *Figaro* (M. Joseph Reinach, who has been an artillery officer as well as a member of Parliament)—relates on August 1: "Yesterday and the day before, I was in the departments of the Marne and the Meuse. There I visited villages which, one year ago, were laborious and prosperous—and not a stone remains of them. Fire was set to them wickedly—by order—on coarsely lying pretexts. I saw along the roads and in the edge of woods and at the gates of towns—tombs, and then more tombs, and great collective burying mounds. I saw once more the cathedral of Rheims, mutilated, immortal, and the heroic city. I spoke with the poor who have lost all. I spoke with the wounded. To me the ruins spoke. The calendar shows we are entering the second year of war. Were it the tenth year, the same voice would make itself heard from ruins and hospitals and tombs:

"'We wish not to have suffered in vain. We wish not to have died in vain. We have suffered and died only to spare our children and our grandchildren, and the children of our grandchildren, the horrors and miseries which we have known. It would be a crime as great as the crime itself—to amnesty the crime. Not to destroy German Imperialism would be to amnesty the crime. Peace is not cannon that cease thundering and rifles returned to their stands. Peace is the victory of the liberty of peoples, the triumph of right. We wish not any other peace. We wish not a truce that would be an insult to our ruins, an outrage to our dead—a sacrilege.'

"And all the land of France—that which the foreigner still tramples, that which shall struggle until victory—answers that the sacrilege shall not be committed."

I go back to my own memories of a year ago. I am certain, with the certitude of one who saw the inmost springs of the French body politic at work, that war was not looked for. On the 25th of July I was speeding in a through train to Switzerland. In my compartment, off like myself to vacation, was a chief official of the P. L. M.—the great Paris, Lyons, and Mediterranean railway which, in a week's time, was to be called on for its utmost effort to get soldiers to the frontier. Talking with me in the dining car was a high official of the war office whose engineering services were to be needed urgently; and he, too, was on vacation leave. We were all preoccupied with Austria's demands on Servia—but even these two great public administrations, responsible for the National Defence, did not foresee what less than one week was to produce.

That Saturday night, Austria's ultimatum was made known to Europe. On Monday, one of my friends who would have a responsible place in any general mobilization, still thought so little evil that, with a military doctor in active service, he crossed into Switzerland for a motor tour. The doctor's military superiors gave him no other warning than to keep within reach of telegrams. Wednesday the two arrived at my hotel, turned back by a dispatch recalling the doctor to his post. It was agreed that he should send the earliest news. From the midst of a great Eastern army post, which would have to centralize the movement of troops when mobilized, he had nothing to communicate until Friday, the last day of July. Then only he telegraphed, "Prepare for the worst!"

Switzerland took alarm sooner than France. She set her militia in motion to guard the neutrality of her frontiers the next day, Saturday, the 1st of August. Rising early, I learned that orders had already been given to prevent the taking of any automobiles out of the country. I awaked my friend at the hotel, and we decided to make an immediate dash for France. In fact, we got his automobile safely across the frontier a few miles away at a country cross-road. Either the customs officer of the Swiss side was too sleepy, or he had not yet opened his orders, to stop us. It was not until Sunday, the 2d of August, that French mobilization became an accomplished fact, and my friend went on to Paris, to take his post in the army, which was at last moving to the defence of the frontier.

The day before, that is, the day before French mobilization began, a band of German troops swept over the frontier near Belfort and took "prisoner"—already—the *maire* of the little commune, eight other chief men, and sixteen horses. This violation of French territory before Germany had declared her state of war and before France had mobilized, was published in the Swiss newspapers that evening. I was the more interested as the *maire* belongs to a family with which I have had a long friendship. The nine men thus taken prisoner before war are still confined, after a year's time, in the depths of Germany. One has died lately. To be exchanged, as others have been, they have been told they must sign a statement that they were on German territory when—arrested! We respect legality or we do not.

My remembrance of this last day of peace sinking into the first day of war in the department of the Ain is still very vivid. I was most impressed by the utter disbelief of Parisians in their vacation that serious danger was beginning. The French Government, as I well saw, awoke at the last moment; and the intelligent people of France were yet slower to realize the possibility of war.

I went on to Savoy, where I witnessed the mobilization. It was this calling away from their work of all able-bodied men that made the first earnest impression. There, as I wrote at the time, I was able to foretell how the unprepared French people would astonish the world by their steadfastness under prepared Germany's attack. There was yet no question of Belgium. Neither Germany nor the world yet knew what French and Belgians had in them. But I heard from all these Savoyards, as they quit hayfield and harvest and crowded into their army trains, the one word which has been their strength in war until now—for more than a year. *Puisqu'il le faut* (since it must be)!

Such are the remembrances of only one man—but one of many, all witnessing the same. And this is enough to prove, with the physical certainty of personal experience, that France neither expected war nor had prepared for it. When the Emperor who was prepared and set the war going says on its first anniversary, "I did not wish it!" I can only answer "Metaphysics!"

S. F. B. Morse and the Telegraph

THE EVOLUTION OF A GREAT IDEA AND THE PATIENT ENDEAVOR BY WHICH IT BECAME A PRACTICAL ACHIEVEMENT.

BY FRANK JEWETT MATHER, Jr.

When Samuel F. B. Morse* conceived the idea of the electric telegraph, in 1832, he renounced a distinguished past. He was forty-one years old, a successful portrait painter, founder and president of the National Academy of Design. His life had been a broken one. In those days, a portrait painter was perforce an itinerant. He had not been able to live for any long time at home, and after nine short years of married happiness his young wife had been torn from him by sudden death, and their three children had gone to relatives. These vicissitudes had hardened his character for a new struggle far more bitter than any he had known. One feels this hardness in his European diaries of 1830 to 1832. He seldom relaxes in holiday vein. The superstition and the frivolity of the Europeans chiefly strike him. The Puritan asserts itself. He had gone to Europe in the hope of breaking out of the groove of portraiture, and realizing early aspirations to the historical style, but the mood is that of a tired and dissatisfied man. One would hardly credit him with the combative energy which he was to show for a bitter ten years to come.

The great idea came to him quite casually when returning to New York, on the packet Sully, in October, 1832. In the cabin one night the talk was of the new electrical discoveries. Dr. C. T. Jackson, of Boston, described the possibility of noting the current simultaneously at any part of a long circuit. Morse remarked: "If the presence of electricity can be made visible in any part of the circuit, I can see no reason why intelligence may not be transmitted instantaneously by electricity."

Unknown to Morse, others were working at the same problem, notably Wheatstone in England and Steinheil in Germany. Military and marine signalling already used the principle of the alphabet. Morse's merit was to conceive once for all the apparatus by which electrical telegraphy became practical. As he himself sensibly insisted during the unhappy controversies which accompanied the perfecting of the invention, the telegraph was not an idea, but a machine. The essentials of the machine he worked out before the Sully reached Sandy Hook.

Samuel F. B. Morse, his Letters and Journals. Edited and supplemented by his son, Edward Lind Morse, in two volumes, with illustrations and diagrams. Boston: Houghton Mifflin Co. $7.50 net. This is a sober and excellent biography woven together from abundant material. The author, Morse's son, has chosen a self-effacing rôle, but evinces good judgment in selection and proportions. Morse's own letters and journals furnish the bulk of a singularly complete and well-documented work.

I.

In view of subsequent controversies about the invention, it is unfortunate that the original notebook which Morse used on the Sully has disappeared. Yet there is no reason to distrust the copy which he made himself of the essential sheets. From the facsimiles in the new official biography, it is clear that Morse at once grasped the notion of the recording key. There is a sketch of a balanced lever with a stylus which bears on a moving strip of paper served from rolls. When the lever is held by the powerful magnet in the magnetic circle, the stylus scores the paper; when the circuit is broken, a weak local magnet raises the lever with its stylus from the paper. In other words, when the electric circuit was closed, a continuous line was made on the paper, and this line, by breaking the circuit for longer or shorter intervals, might be traced in dots and in dashes of any desired length. By breaking and closing the circuit at any point, the same dots and dashes would be recorded by any number of such keys. Mechanically and scientifically the apparatus was right from that moment in October, 1832, when Morse casually scrawled on pages 25, 26, and 29 of his pocket notebook. The perfecting of the invention concerned chiefly working the dots and dashes into the most convenient sort of code, and assuring circuits of sufficient power, length, and permanency. In all these later developments we enter a highly controversial field, with confusing claims and counter-claims. So we do well to remember that from the first flash of invention in Morse's mind there has been no radical change in the telegraph as an apparatus, merely refinements on Morse's principle, no change in the visible units by which the communication is made. Two of the most essential improvements have been claimed for his later partner, Alfred Vail, the alphabetic code and the relay which permits indefinite lengthening of the circuit. This matter we must consider briefly in its turn.

But before opening so contentious a chapter, one would willingly dwell on that flash of vision by which a difficult problem is once for all solved, a revolution effected in the turn of an eye. Of course, no such thing comes literally out of the blue. Morse had long had an intelligent interest in the new discoveries in electricity. At Yale, he writes with enthusiasm about Professor Day's experiment in the "Philosophical Chamber," and Professor Dwight's lectures. Later, in New York, he heard Prof. J. M. Dana in public lectures and demonstrations. He had never heard of Joseph Henry's researches at Princeton, which might greatly have shortened his labors and prevented the most infelicitous of his many controversies. Yet the smattering of electrical lore which he gained was enough. Men of his sort build on the broadest general principles which ordinarily they assume. Their business is with application. Their task is not that of science, but of supermechanics. Morse himself was wholly conscious of his rôle when he insisted that the telegraph was a machine. He was large-minded enough to distinguish between those who create and enlarge science and those who set it to work. It is a distinction that needs to be repeated and emphasized in an age that tends to confuse the Morses and Edisons with the Faradays and Kelvins.

II.

Fenimore Cooper, with other friends of Morse's, always insisted that before the memorable voyage of the Sully he had talked about and studied telegraphy in France. Morse himself had no recollections of the alleged conversations and studies, but was unwilling to question the memories of his friends. How much such stories lie in the realm of myth it is now impossible to decide. In any case, we do not need these European stages of the legend, for Morse plainly merely represents in its highest and most accomplished type the inventive Yankee, by birth and inclination. I suppose there are few of our old New England stocks where the family skeleton in disused closet or attic is not crowded by wooden and metal contrivances which are the models of patented or patentable inventions. Generation by generation the necessity to patent or copyright something persists in such stock, usually to their financial detriment, and those who have patented nothing at least dream of so doing, and lend money to those who put such dreams into action. Often it is an unselfish desire, half artistic, or a mere expedient to secure comfort. The best solution of the problem of bifocal spectacles has been worked out by the keeper of a knicknack shop in a small New England port. He has never taken the trouble to patent it. It is enough that his own glasses no longer bother him.

Of such a line came Samuel F. B. Morse. His father was an orthodox Congregational clergyman in Charlestown, Mass., but the family prospered, not by virtue of the salary, but from a geography and a gazeteer which the Reverend Jedediah had compiled. Morse himself, in his young manhood, had invented, as preliminaries to the telegraph, a pump, a fire engine, and a machine for mechanically reproducing sculpture. What is peculiar in Morse's case is not the super-Yankee inventor, but the fact that he belonged as well to the "Brahmin class," which is generally uninventive. He had withal a massiveness and persistency of character which is again commoner in the New England urban aristocracy than in the rural class from which the inventions generally come. He was an inventor superimposed upon an artist and an *intellectuel*. Of all the qualities he had need, and they were put to sore test before the day of ultimate triumph.

As soon as Morse landed in New York, he began to work at his model; but there were many threads to take up, and it was not until 1835 that he fully committed himself to the new venture. His decision was pre-

cipitated by the shipwreck of his artistic ambitions. Congress had voted funds for four mural paintings to complete the decoration of the Capitol at Washington. Morse, as president of the National Academy, had the best prospects of getting one of the panels. President John Quincy Adams, however, distrustful of American talent, entered a resolution opening the competition to foreigners. This action was sharply criticised in a letter in the *Evening Post*, which was generally attributed to Morse. It was, in fact, the well-intentioned championship of his friend, Fenimore Cooper, which had put him out of the running. From this chagrin Morse never recovered. He came to regret his devotion to painting. It was much more than the loss of a promising commission, it was the dashing of the hopes of a lifetime to excel in the historical and monumental style. He burned his bridges, but with prudence, gradually withdrawing from portraiture as other support offered, and resigning as soon as he honorably could the presidency of the Academy. Immediately he accepted a professorship of the literature of the arts of design in the University of New York, honorable drudgery which nearly afforded a livelihood. There, from 1835 on, in the now vanished building on Washington Square, he worked out the details of the great invention. At times his poverty was extreme. He lived frugally on the provisions which he brought into his studio after nightfall. As a great personage in New York, he must conceal the narrowness of his life.

III.

For several years he was on wrong tracks. He experimented with a dictionary code, the signals representing entire words and phrases. His feeling was still that the telegraph would be used only for important and secret business. But as early as the notebook of 1832, he had seen that the letter code must sometimes be used, as in proper names. For a long time, too, he made the signals by notched types which mechanically broke the current. Eventually this plan was abandoned for freehand manipulation of the key. For the key itself, after experiment with a pendulum form, he returned to the simple apparatus sketched in the memorable notebook. Before the year 1835 had closed, he had, unaided, carried the machine to the point where he could transmit messages through about forty feet of wire. It seems that he independently discovered the principle of the relay, but the difficulty persisted of obtaining current enough to record a message through a single circuit of more than forty feet. At this point a new colleague, Prof. Leonard D. Gale, came to the rescue. He was conversant with the recent discoveries of Joseph Henry. Once multicellular batteries and more powerful magnets were installed, it was easy to transmit messages over ten miles of wire.

In the late summer and autumn of 1837 Morse gave a number of demonstrations with a circuit 1,700 feet long. On September 2 there was present among greater notables Alfred Vail, a young alumnus of the University. His family owned the Speedwell Iron Works at Morristown, N. J., were prosperous and influential. He offered himself as Morse's ally, agreeing to finance the experimental stages of the invention, and to make the working models. Vail's mechanical cleverness was much superior to Morse's, and while any attempt to allot credit for the machine that finally was patented seems impossible, it is to be presumed that Vail's influence may be traced in the gradual simplification of the apparatus. It should be noticed, however, that such simplifications are invariably only so many returns to the sketch-book of 1832. The probability is, then, that at a time when Morse may have been somewhat confused by the many alternatives presented from his own teeming mind, Vail, reviewing the whole course of experimentation with greater coolness and detachment, aided substantially in the choice of the better possibilities. There is no question that he brought a great access of strength and encouragement to Morse at a critical time. It is not easy to exaggerate the moral support he brought to his partner. He was loyal under trying circumstances.

It is not unnatural that local patriotism and the piety of descendants have created a Vail legend which credits to him the invention of the alphabetical code and the local circuit. It should be said, however, that he never personally claimed either invention, and that the evidence seems conclusive that Morse had solved both problems before he met Vail in 1837. The claims for Vail, which have produced a considerable controversial literature, seem to the reviewer based on a misconception entirely honest but untenable. The machines which Vail unquestionably made are regarded as marking the discovery of the principles under which they were operated. The wording of his diaries often lends color to such a misinterpretation, quite innocently, for, of course, he was adventuring in a field new to him. As a matter of simple justice, however, one must insist that Vail's aid was chiefly moral and financial. Nothing that he contributed to the machine patented in 1837 was as indispensable as that counsel of Professor Gale, by which the telegraph was at once changed from an ingenious scientific toy, communicating across a room, to a practical means of communication across great spaces. And the candor with which Morse acknowledged the aid of Gale gives no color to any supposition that he consciously minimized any contribution that other associates may have made. It is well to recall that the three original partners always remained friends, and that in their lifetime there were no conflicting claims of any sort.

On January 22, Morse gave a private demonstration to many New York notables through ten miles of wire strung in his lecture-room. One of the spectators indited the bombastic yet not wholly inappropriate message: "Attention, the Universe, by kingdoms right wheel." The experiment was the occasion of intelligent and enthusiastic comment by the press, and the way of the inventor should have been thenceforth easy. As a matter of fact, it was five years before the Government sustained the project in the experimental line of 1843 between Washington and Baltimore. Meanwhile, Morse was harried by the insane claims of Dr. Jackson and by the treachery of later business associates, by the unfair and arbitrary denial of a patent in England, by the unexpected failure of a great contract with Russia. The general reception before the French Academy of Science, in 1839, where Arago explained the invention and Guy-Lussac and Alexander von Humboldt commended it, is one of the few bright spots in these years. But the French Government was as slow to move as the French savants had been quick. Morse returned disappointed to New York, where in 1840 he was within sight of death from starvation. Yet he won through, and after infinite difficulties, largely overcome through the zeal and patience of Alfred Vail, the wires were stretched from Baltimore to Washington. The test message which Morse sent from Washington to Vail at Baltimore was, "What hath God wrought!" Vail returned it correctly to the sender. Before that momentous experiment, the telegraph had sensationally proved its effectiveness by picking up from a train the news of Frelinghuysen's nomination as Vice-President, and getting it to Washington a full hour before the train's arrival. Soon the doubters in Congress and the business world were on Morse's side. At fifty-three, he had gained a new fame, this time world-wide. After eight years of poverty fortune was assured.

How weary he was of the struggle, how moderate were his personal ambitions may be understood from his offer to the nation of his controlling interest in the telegraph for $110,000. A month after the brilliant test of the Washington-Baltimore message he would gladly have exchanged prospects of wealth for a modest competence. The refusal of Congress to entertain the proposal must be reckoned as one of the major instances of official shortsightedness. If Morse was easily satisfied on the financial side, as regards the telegraph itself, he was consumed with a zeal of perfection. He tried every possibility, constantly revising the mechanism and its accessories, even in the vexatious times when the experimental line was being built. Shortly before the successful test, he discovered the principle of duplex telegraphy. In the summer of 1842, as the result of actual tests, he confidently predicted transoceanic telegraphy in a public report to the Secretary of the Treasury. Other improvements, such as reading by ear, had come almost as a matter of course.

IV.

To trace the remaining career of Morse is unnecessary. It was varied by frequent European trips, in which he received the highest social and official honors. A happy

second marriage in 1848 brought tardily the domestic joys which fate had earlier denied him. He settled down in a delightful country place at Poughkeepsie, an impressive and venerated figure. Fate still reserved sore trials for him, partly in the defection of business associates, partly in harassing controversies concerning the credit for the invention of the telegraph. Of these the most gratuitous and deplorable was the feud with Joseph Henry, which was occasioned by a needless oversight on Alfred Vail's part. Morse took these infelicities the harder, that he held a fairly mystical idea of himself as individually inspired by Providence. From the first, he dwells upon the benefits of the telegraph to society. In 1855, when the cable was being laid, he writes to a friend:

> The effects of the Telegraph on the interests of the world, political, social, and commercial, have, as yet, scarcely begun to be apprehended, even by the most speculative minds. I trust that one of its effects will be to bind man to his fellowman in such bonds of amity as to put an end to war. I think I can predict this effect as in a not distant future.

So speaks in old age the man who in youth had aspired to equal Raphael, Michael Angelo, and Titian. To perceive how much delusion may accompany the highest character and the greatest practical capacity should work toleration even in a critic. As a matter of fact, the generous youth had died very early in Morse. It is pathetic to find the patriot of the War of 1812 merely disgusted with the Civil War, declaring that there was glory for neither side, and willing to accept peace at any price. Throughout Morse appears more admirable than amiable. In his letters and journals there is seldom a touch of humor or sentiment, often something hard and schoolmasterly in quality. To his most faithful associates he was none too considerate; he had suffered too much from faithless allies. Yet in a man of his moral massiveness and tenacity we can hardly expect the more adaptive graces. A certain Olympian detachment is not compatible with full charity. It is odd and instructive to find Morse at the very moment when his invention needed all his forces, wasting himself in pamphleteering against a wholly imaginary conspiracy of the Roman Catholics. Yet it was, however mistakenly, a question with him both of his religion and loyalty. The converse of the positive strength of such a character is its capacity for moral repulsion. The penalty of such concentration is narrowing the vision and distorting it. In Morse unquestionably there was some sacrifice of the man to the inventor. Yet this self-imposed restriction has its austere nobility. It hardened the fibre for a particular work, and the justification of a process in which an able artist perished utterly and a man of culture was warped into a particular mould must be found in the sure immortality which Morse won for himself among the great inventors and benefactors of the race.

Poetry

DRAGON'S TEETH.

By RICHARD BUTLER GLAENZER.

When I review the dark
Year that is gone,
I wonder whether God regrets the ark;
If it is He who locks away the dawn:
I dare not ponder why our prayers to Christ
Have not sufficed.

August, so fair, so rich
With fruitful life,
Bartered her golden harvest for a ditch,
Her scythe of silver for a butcher's knife:
She who wore once the grateful farmer's wreath,
Sowed dragon's teeth.

Alas, no Cadmus crop
Sprang from the earth,
But fiends whose bent no royal word can stop.
The blood they spill but teems with viler birth:
So sweet to them is hatred's poisoned breath,
They thrive on death.

Twelve fateful moons ago
Man prospered, proud
Of primacy. How swift his overthrow!
Blacker and lower broods the horrid cloud:
What will its depths disclose? Thy Peace, O Lord,
Or Flaming Sword?

Notes from the Capital

AN APOSTLE OF THE MEAN.

Though everywhere recognized as a courageous man, William E. Borah has never been given to acting on impulse. His views on our foreign relations, as set forth in his recent speech at Spokane, are probably, therefore, the well-considered outlines of a policy which he thinks it but fitting for one in his position to make public at this juncture. They point, moreover, pretty plainly to the part he may be called soon to play as the compromise Presidential candidate of the Progressives led by Roosevelt and of the regular Republicans typified by Root. How well his pronouncement will be received depends on the passing temper of the people at large, whether they feel like nodding assent to his down-right disparagement of our national spirit or object to being advertised to the world as an easy mark for every international bully. Other orators, as a rule, even if they do not approve in all respects of the diplomatic course pursued by the present Administration, have tried to save its face by putting the disagreeable things they had to say into the future subjunctive rather than a past tense. But that is not Borah's way. He does not warn us of what is likely to happen if we leave the country unprepared for war; he reminds us of what has already happened. Our men "have been" murdered; our women "have been" brutally maltreated, our flag "has been" insulted, he declares, and we have done nothing to right these wrongs. This has somewhat of a Rooseveltian ring. On the other hand, the Senator does not advise taking the aggressive now, rushing in and smashing our adversaries to smithereens. He only urges preparedness, so that, if similar occasions arise in the future, we shall be in a position to act at once as may seem best.

Here is the man on middle ground, blinking nothing as it stands, but pleading that untoward conditions be not allowed to remain as they are. His friends are very careful to draw the distinction between a straddling disposition and his poise of broad responsibility. They claim for him a strong sense of justice towards both sides of every question. The first case he tried as a lawyer in the rude frontier country where he had hung out his shingle was in defence of a ruffian charged with murder, and he won it. He was personally willing, and of course professionally glad, to save the fellow's neck, but he did not rest till he had done something to compensate the county for helping one of its human nuisances to escape elimination; so he seized the opportunity to reason with his client while the latter was still in a grateful mood, and induced him to disappear and never return. Again, though he was ready to risk his own life to rescue a negro whom a mob was preparing to lynch for wounding a constable in a street fight, this did not prevent him from approving President Roosevelt's dismissal of the colored troops at Brownsville without trial, on the ground that short shrift must be given treason.

He recognizes the human weaknesses of many judges, yet believes that we should not visit these shortcomings on the courts as a whole by subjecting them or their decisions to the recall, but should "cling to an independent judiciary as the men of old clung to the horns of the altar." He does not deny that a few amendments could profitably be made to the Constitution in response to the demands of modern life on its social side, but has no patience with the chatter about doing away with it, insisting that "our fathers understood the science of government as no other single group of men has ever understood it," and that probably, "if the plan upon which they built fails, with it will pass the hope of a democratic-republican form of government." And after successfully fighting the battle of a poor and obscure claimant against a powerful corporation, he was just as prompt to turn prosecutor in the cases of the leaders of the Western Federation of Miners accused of supplementing legitimate agitation with dynamite bombs and a campaign of terrorism. Quite as characteristic was the position he took in the campaign of 1912, sympathizing with many of the principles avowed by the Progressives and deploring the neglect of the Republicans to adopt them, condemning the steam-roller methods of the national convention of his party, yet telling Col. Roosevelt flatly that the secession of the malcontents was a colossal blunder, and himself supporting Taft in spite of all that had evoked his disapproving comments on the regular platform and ticket.

Looking at Borah, one can hardly help wondering how he came by his calmness of judgment and manner; for his cool blue eyes are more than matched by his pugnacious nose, and his facial features and coloring suggest a rather recent Irish descent. He has an abundance of straight, black hair, a round face, lips that are full but not bulging, and

cleft chin. His whole effect is boyish, as he looks straight into your eyes with his habitual expression of cheerful candor. He is of good size rather than large, his well-knit frame and firm carriage giving you an impression of bulk which later proves a trifle misleading. He dresses simply, but with no affectation of carelessness, his black wide-awake hat and sack coat being the familiar costume of his Western home. In his daily intercourse with his fellows he is not at all a talkative man. As a public speaker, the first things about him that attract you are his quiet pose, his musical voice, and his clear enunciation; next, the air of good comradeship with which he draws you over to his view, instead of driving you like La Follette, or wearying you into helplessness like half the orators against whom he finds himself matched in the Senate.

VIEILLARD.

Book Notes and Byways

LUTHER S. LIVINGSTON: THE MAN AND HIS WORK.

By JOHN THOMAS LEE.

I.

"An American scholar died on December 24, 1914. Self-made, the doors of opportunity opened to him a few months before, and with many misgivings he passed through them. He found himself among men of recognized attainments who, to his surprise, welcomed him to their assembly and conducted him to a seat beside the most honored. While he was still wondering how best to show his appreciation for their recognition, he died."

These words fitly introduce a sympathetic and carefully written sketch of the life and work of Luther S. Livingston, printed for private distribution by Mrs. Livingston. Although the little volume in its final form (attractively made by Mr. Bruce Rogers, who also drew the accompanying portrait) is issued without the author's name, it is no secret that the lovely tribute is from the pen of Mr. George Parker Winship, librarian of the Widener Memorial Library at Cambridge, Mass.*

Mr. Livingston must have possessed rare charm of personality and nobility of character to have won the enviable place which he now holds in the hearts of men. His achievements in horticulture, book-selling, and bibliography, notable as they were, could not alone have gained for him the fame which rightly seems his, for fame none the less it is, though circumscribed. The man was greater than his work. And it is a fine and stimulating thing to encounter in this time of hurry and sordid endeavor a scholar with the freshness and sweetness of the open about him: such appears to have been Luther Livingston.

When, a hundred years hence, some kindly and learned antiquary undertakes to write of the American booksellers and bibliographers of the twentieth century, he will single out for especial notice, I am sure, the name of Luther S. Livingston. He will tell his readers with charm of phrase (let us hope) that Livingston was not musty or unlovable or self-centred, as sometimes are those of his calling; that from small beginnings and none too well equipped with what the schools had to give, he, nevertheless, with good sense, diligence, and a clean heart, made a lasting place for himself in the world of books. And, what is far better, he at the same time cultivated and retained the friendship of the men whose money he took for honest service. Our historian, too, will dwell with emphasis on the man's love of flowers, his poise and mental integrity, and his fortitude in meeting physical suffering. Distress of body did not undo him or shake his faith in God or man. His fortitude seems to have been invincible.

The reader should know that these words are written by one who never met Mr. Livingston face to face, and who knows him only through his work and his friends. Why, then, should I care to write about him? Perhaps because such men, in a hundred ways, make their influence felt by those who never clasped hand with them, through leagues and leagues of space.

II.

I may be pardoned, I think, for giving a few biographical details before proceeding to notice Mr. Livingston's work. For Mr. Winship's sketch, on which I must rely, limited as it is to two hundred copies, will not have a wide circulation. And, moreover, it is necessary to know something of the principal facts of our subject's life, if we are properly to appreciate his work.

Luther S. Livingston first saw the light in Grand Rapids, Mich., on July 7, 1864. At the age of seventeen he left the high school, and obtained employment in a local book-shop. Some years later he was obliged to relinquish this work, on account of ill-health, and spent a summer in the open, collecting butterflies and wild flowers. In 1887 he became the shipping clerk of Dodd, Mead & Co., of New York city, with whom he was for many years to be identified.

Being an outdoor man, who did not take kindly to city ways, he, in 1888, took up a Government land claim in Florida. "The inspiration for this venture," says his biographer, "came from the books of Thoreau"; but, "after a year of unremunerative grubbing at palmetto roots, Livingston returned to the New York book-store."

Early in life he evinced a fondness for flowers, and his familiarity with the technical names of plants, together with his accurate information concerning them, prompted the firm of Pitcher & Manda, of Short Hills, N. J., to offer him a place on their staff, which he accepted. His first work was the compilation of catalogues, and here his aptitude for the niceties of description was shown from the first. It is said that the catalogues prepared by him have become classics among horticulturists. He was later sent to Colombia to execute an important commission—the collecting of orchids, a most engaging pursuit, one would think. His experiences in South America were duly chronicled in his notebooks and in charming letters to his mother. Fortunately, as I like to think, the financial crisis of 1893 was the cause of his return to the business of books. He remained with his old employers, Dodd, Mead & Co., until 1912, when a cruel accident robbed him of his physical vigor and consigned him to an invalid's chair.

Mr. Livingston married, in 1898, a friend of his boyhood, Miss Flora V. Milner, of Deer Lodge, Mont. At Scarsdale, nineteen miles from New York city, they made their home; and here Mr. Livingston transformed his three acres of woods, cliffs, and swamp into a wonderful garden, in which, we are told, he spent the happiest part of each week. "Under his wizard touch, this little country home lot became a botanical museum," writes Mr. Winship. "Month by month he added to his treasures, until he was nearing the consummation of his ambition to possess a healthy growing specimen of every variety of flowering plant that could be induced to take root in the latitude and longitude of New York city. . . . The parting from that garden within sight of the reflected lights of Broadway was not least among the tragedies of Livingston's last year."

*Mr. Winship's tribute to the memory of Luther S. Livingston, in abridged form and with a bibliography, was first printed in the Papers of the Bibliographical Society of America, Vol. VIII.

Correspondence.

THE GERMAN PROPAGANDA.

To the Editor of The Nation:

Sir: Some Americans are asking to what lengths the German propaganda may dare to go; others, how far German militarism is setting back the clock of civilization. The following statement of fact may aid their estimates. Lest anyone believe the statement unbelievable, I will add that I have it not from the newspapers, but from a friend who is well acquainted with the victim.

Among the hundreds of poor street-venders now in Athens, a man was last week crying out his picture-postals and cheap prints of distinguished people. An officer of the Greek navy hearing him asked: "Whose pictures have you there?"

"Pictures of the King, the Queen, Venizelos, and others."

"Haven't you any of Gounaris?" (Gounaris is the pro-German Prime Minister.)

"No."

"Why not?"

"Because there is no sale for them; nobody wants them."

The officer beckoned to a policeman and ordered the man's arrest. The policeman obeyed. The man was imprisoned, and was not released till the next day.

This is the whole story. I have suppressed no detail which could mitigate the officer's conduct. The act stands as a clean-cut statuesque example of German propagandism and militarism combined. It takes place under a constitutional monarchy modelled after that of England, but now, unhappily, in the hands of a pro-German King, whose energetic wife is sister of the German Kaiser. The clock of civilization, as it seems to me, is thus set back exactly 700 years, to the time before Magna Charta.

L. L. Forman.

Athens, Greece, July 27.

EXTRA-LEGAL "DUTIES."

To the Editor of The Nation:

Sir: It is with great satisfaction that I follow from week to week your consistent and powerful support of the side morally right in the lamentable European struggle. For how easily does the issue become confused! Even the change of seasons affects men's moral intuitions—so frail a thing is man's conscience! The price of a pound of cotton now threatens to determine our attitude towards democracy and autocracy in their death struggle.

So much is said of our rights, but has not a nation also duties? While the Government upholds the nation's rights, surely it behooves the nation to consider seriously its duties.

Neutral let our government remain so long as that be morally possible, but the citizenship of the country has never been neutral since Austria sent her fateful ultimatum to Servia. Except for the German-Americans and a small minority of our other citizens, that ultimatum inevitably ranged us on the side of the present Allies. The crisis is too sharp, the issue too vital, the contentions too utterly at variance for us to be at heart passive spectators. We share vitally with the Allies in their struggle for national freedom and independence. It is our own struggle, even though we must for the present refrain from participating with arms. But if it is our own struggle and we must not participate with arms, what must be our bearing and deportment during its progress?

Alas, that so many of us determine our bearing and deportment on the basis of Iago's advice

Put money in thy purse!

Doubtless the munition-makers of the North are actuated largely by this advice, but fortunately they make money by means which happen to be in keeping with the interests of the nation and the welfare of the world. If they have no other motive in the manufacture of munitions than the making of money, then are they of all men most contemptible. But the cotton growers of the South in their clamor against England and their determination to sell cotton to Germany are in deadly opposition to the interests of America and the world: they seek to feed the cannon of the Teutons. Is it too much to expect of human nature that we should look beyond the price of a season's crop and lend at least the weight of our financial sacrifice to the cause of human liberty? OLIN DANTZLER WANNAMAKER.

Auburn, Ala., August 12.

WAR SONG OF FRENCH WORKMEN.

TO THE EDITOR OF THE NATION:

SIR: These verses, some strong, none pretentious, and the whole of them together giving an impression of the force beyond words which animates all classes in France, are published by the *Bataille Syndicaliste* of Paris. This is the organ of those Labor Unions which, in peace, separated themselves most from the present organization of human society in Europe. Now, under war, they hark back to their fathers of the great Revolution who, in 1793, marched as one man on the invaders of their country. Then, as now, the invaders formed what Arthur Balfour, on this first anniversary of renewed war on the Liberty of Peoples, calls "alien and despotic Militarism."

This new "Hymne du Départ" accepts—"if it must be"—that sorest trial of "one year more" of war. Its author speaks in the name of a Labor Revolution which was verging, as many of his own fellow-countrymen were convinced before the war, on Anarchy. If the Frenchmen who adhere to such Labor movements quit themselves like men to-day, it must be that they were essentially good citizens yesterday. And this dispels another illusion regarding France and the people generally and so may help towards an end surely unforeseen by the organizers of this war—

In the Parliament of man, the Federation of the world.

I have tried to give only a very literal translation, line by line, so as to keep something of the tramping rhythm of these French toilers' feet marching to the wars. Since I witnessed the first call to arms and military mobilization of these workmen and peasants of France, I have often written in my letters of the strong, sane impression made on me by words with which I heard them universally comforting each other—*"Puisqu'il le faut* (since it must be)!" After a year's hard service of war, they repeat their words in their poet's verses. What American can read them and not hear echoing within himself his own Emerson's "Voluntaries"?

So nigh is grandeur to our dust,
So near is God to man,
When Duty whispers low, *Thou must,*
The youth replies, *I can.*

STODDARD DEWEY.

Paris, August 5.

WINTER CAMPAIGN.

By Raphael Périé.

The day that Germany opened up the abyss,
One and one only word, peaceful, sublime,
Was spoken by the one-minded people:
It must be.

Toil of the hands, labor of thought,
You must quit the work you've begun:
It must be.

You must depart as in Ninety-three:
You must quit your mother and your wife:
It must be.

You must quit, for atrocious war,
Your sweet little girl and your good little boy:
It must be.

You must kill to save your country
And liberty and wounded justice:
It must be.

You must will the attack under shellfire
Or the trenches when not in the battle:
It must be.

You must will the gas that chokes and the mines,
The hand-to-hand fight, the shadow where they slay,
Feet that freeze and mud and vermin:
It must be.

Dear workman, put off your hope
To do away with hunger and suffering:
It must be.

Dear peasant, your wife wears herself out;
She is sobbing as she pushes the plough:
It must be.

Ah! well I know—sister, young brother,
Old parents—'Tis hard, such misery;
'Tis not I will say the contrary:
It must be.

Soldier of France, finish the work.
You must remember sorrowful Poland:
It must be.

You must think of the great misery
Of Rheims and Arras and of the Belgian your brother,
And, beyond, how Alsace weeping awaits you:
It must be.

Yes, your flesh bleeds and your heart eats itself away,
But you will hold out yet one year more,
If it must be.

THE IBERIAN.

TO THE EDITOR OF THE NATION:

SIR: The fourth paragraph contained in the "Summary of the News" of the issue of the *Nation* of August 5 is somewhat disappointing reading. Really, is there not more to be said on the killing of the three Americans on the Leyland liner Iberian than that "the case, however, is likely to present no international difficulties, since on the evidence before us, it would seem probable that the Iberian was summoned to stop and was only shelled by the submarine when the captain disregarded the order"?

If our citizens, as we maintain, have a perfect right to be safe anywhere, even on board belligerent passenger steamers, why should this not hold good in the case of the Iberian also, so far as the captain's responsibility towards neutral passengers is concerned? In other words: What right had the captain of the Iberian to impose the gravest risks to life and limb on the Americans on board, as he did by "disregarding the order" of the hailing submarine? It surely has not come to this that English captains shall be free to hold the lives of Americans and other neutrals more cheaply than the vessels they command!

It seems to me, if we insist upon the right of free passage for our citizens, and will hold Germany to "strict accountability" in case of loss of life, we must also insist uncompromisingly on the corollary of this assertion, viz.: that captains of English passenger steamers, having American travellers on board, must stop under all circumstances, when legitimately hailed by enemy undersea craft, or our Government will hold them, and Great Britain, to as "strict accountability" as we do Germany in the Lusitania case.

This view of the case, as given above, I have missed altogether in your otherwise very clear-cut delineation of the affair. I hope you will make this side of it the burden of some paragraphs in a future "Summary of the News." WM. B. SCHULZ.

Baltimore, Md., August 10.

[The right under international law of the captain of a merchant vessel to evade or resist capture by an enemy warship has never been disputed.—ED. THE NATION.]

HENRY JAMES AN ENGLISH SUBJECT.

TO THE EDITOR OF THE NATION:

SIR: The decision of Henry James to become an English subject must have been arrived at very suddenly, for he evidently never dreamed of it a few short weeks, or even days, perhaps, before taking this action. I received a letter from him dated "London, June 23d," and posted even a day or two later, to be read at our annual Cornell Reunion in Europe, which occurred here in Paris on the 26th of last month. From one end to the other, this rather long letter breathes only the most ardent and sincere affection for America. It opens with a proud reference to "our American Volunteer Ambulance," of whose committee Mr. James is chairman, and then he goes on to say: "I am struck at every turn more and more with the amount of active coöperation that the inspiring cause of the Allies can look to from our countrymen—there, in fact, seems no limit to it." In my letter to him, I had said that the spirit of the gathering would be "decidedly pro-Allies," whereupon he replies: "'Decidedly,' my dear countrymen, is the palest of adverbs to describe the helpful passion that I myself have become acquainted with among us all"; and then he proposes this toast: "To the inspiring idea of our collective American rally to the aid of Civilization as menaced as never in the world before—may its shadow not grow less!" And again, in closing, he mentions "our boundless goodwill for France."

Mr. James was granted naturalization on July 26th. His petition for this end must have been sent in some days before. It is safe to say, therefore, that at some time within less than a month after writing his Cornell letter, Mr. James decided to abandon American citizenship, which evidently filled his heart to overflowing on June 23d.

One of the many lessons taught, on both sides of the ocean, by this present war is the chariness one should show in this matter of changing one's nationality. In the past, the

spread-eagle American has now and then found fault with Mr. James because he is "an American residing in England." But it is safe to predict that in the years to come Mr. James may hear his new fellow subjects chide him with being "a naturalized Englishman residing in England," for Mr. James should not have forgotten the profound reflection of La Rochefoucauld. that "L'accent du pays où on est né demeure dans l'esprit et dans le cœur comme dans le langage." THEODORE STANTON.

Paris, July 31.

APROPOS OF THE ALLEN SURVEY OF THE UNIVERSITY OF WISCONSIN.

TO THE EDITOR OF THE NATION:

SIR: Here's a useful rhyme for those who've read good Dr. Allen's prose:

An expert in Efficiency (don't think good Dr. Allen he), now having proved by rigid rules all educators blundering fools, determined deftly to proclaim all poets very much the same. Here is a page from his report (except I've tried to cut it short): "SECTION 9, EXHIBIT K. ON POETS' PUTTERING AND DELAY: THE CASE OF MR. THOMAS GRAY. This poet piddled seven years with ink-pot, foolscap, books, and shears; and frayed his breeches past all patching whilst his slow Elegy was hatching. Seven years—an inefficient Gray. I had my clerk the other day (an average lady as to rhyme) write out for me said Elegy by up-to-date stenography; and seven minutes was her time."

O Expert, you and I, we two, know all there is to know, we do: I know that you're a chump at best, and you—O you know all the rest. UNCLE SILAS.

Madison, August 1.

LEONARDO DA VINCI.

TO THE EDITOR OF THE NATION:

SIR: A review of Thiis's "Leonardo da Vinci" in the *Nation* of June 17 contests some of the results of that important work. I agree closely with the reviewer's idea of the probable development in style shown by Leonardo's early drawings and pictures, and should like to argue a point or two in detail.

And first as regards the landscape in Verrocchio's Baptism of Christ, my chief reason for believing it Leonardo's is that it exhibits, in an obviously immature phase, characteristics peculiar to Leonardo as we know him in authenticated works. Certain of these may be briefly described as follows: (1) The generalized rocks, surviving from mediæval art, but modified, probably in memory of effects, seen from Vinci and even from Florence, of the sharp peaks of the Carrara Mountains under special atmospheric conditions; effects reinforced by the views of the Monte Rosa chain from the plains of Lombardy and culminating in the Alpine vistas of the St. Anne. In relation to this traditional archaism we may observe that the ground in Leonardo tends to a conventional flow of its masses and lines, rather than to the firmly organized natural structure characteristic of Masaccio. (2) This conventional geology serves, however, to focus the thrilling cosmical meteorology, the concrete and plastic sense for air and light as almost illimitably yet objectively imagined. The backgrounds of La Gioconda and the St. Anne are not fantastic, romantic experiments, but supreme achievements in landscape truth, which have for counterparts in European style only the works of men intellectually transcending merely professional standards—men like Rembrandt and Turner. (3) But Giotto has a broad and plastic elemental meaning—shown in his limning of light by sharp definition of shadow, and Masaccio the noblest cosmical sweep; what was needed to establish landscape style upon classical foundations, as distinct from a merely phenomenal aspect of things, such as determines Northern naturalism, was the working out of pictorial texture, which Leonardo gives us, with some inadequacy of technical resources, indeed, on a grander scale than any of his contemporaries. The conjectural early works are incomplete experiments, but in their application of pictorial texture to the more primitive patterns or the more sculpturesque drawing of traditional practice they exhibit an initiative for which Leonardo's authorship seems to me the only reasonable explanation. I find the first steps to such details as the great tree in the St. Anne, perhaps the noblest tree in art, in the foliage of conjecturally early pictures like the Uffizi Annunciation, where the complications of refracted and reflected light in the leaves are attacked with an elaborate fervor absent from mature work. In this picture, which shows more skill and must be a little later than the Baptism, Leonardo has not discovered his technical limitations and is thus more the ambitious pure painter than later on. I cannot, by the way, see two hands in the execution here, or even the repainting asserted to exist as an essential factor in certain passages.

There is no measurable demonstration in a rapprochement of the authentic landscape drawing of 1473 to the Baptism landscape, yet many students have felt a similarity in style and temperamental quality—the design is quite different. The drawing is a mere scrawl, very rapid in stroke, and probably, I should say (to judge by observation of a modern artist at work), rather a mnemonic and even half reflex note for a picture than a study from nature; yet it contrives somehow to translate very vividly a real scene. The squared fields, the definite contours of foothills, the tree masses, etc., are summarized in exactly the fashion of Far Eastern drawings of the later classic landscape periods—as in Sesshiu's open landscapes. We have a vague means with a concrete result—a sort of elemental impressionism. The rapprochement to Oriental modes is, however, *pace* the German theorists, a natural affinity.

As regards the date of the little Louvre Annunciation, I think the technical evidence should be conclusive. To me, as it marks an emancipation in composition from the conventional patterns of the early Renaissance, it might be as late as the Adoration of the Magi, but for a certain naïveté in its types. But it is a by-product, an academic exercise, compared to its Uffizi prototype, which engaged an artist's whole strength—whoever did it.

There are other points in Dr. Thiis's view of the early career of Leonardo to which I hope to contribute an opinion on further study of the book. I am not sure, however, that any scholar has explained a peculiarity in the early drawings—which, I think, is less marked as Leonardo works at sculpture seriously—and would call the attention of students to it here. I refer to the odd failure of many of the figure drawings in articulation or proportion of limbs. I need not particularize examples, as the fault is obvious when attention is called to it. It would seem that the naturalistic studies of the young master and his training under Verrocchio—an impeccable draughtsman in the matter referred to—gave correctness in detail, while the sketching habit and a generalizing tendency inhibited at times a vision of the figure in action as a whole, so that we have arms, especially those out of the figure plane, which are out of proportion with or do not belong to the body. There is a question here also of a habit of "frontality" in pattern, which I will not now discuss. I may say that the point concerns the authenticity of the Madonna of the Pink at Munich. Morelli noticed the bad drawing of an arm in the Christ Child in this much-damaged picture, and used it as an argument against Leonardo's authorship. As a matter of fact, the awkward arm is, so far as it goes, a sign of authenticity, as the peculiar fault occurs in many absolutely genuine drawings.

WILLIAM RANKIN.

Roselle Park, N. J., June 21.

"THE STYMIE."

TO THE EDITOR OF THE NATION:

SIR: As a golf enthusiast for twenty years, I am struck by your comment, in the Centennial number, on an article by Mr. John G. Anderson advocating the abolishment of the "stymie." What occurs to me, and what I would call your attention to, is that neither in your editorial nor in Mr. Anderson's article, apparently (I have not seen the article), is the logical reason for the abolition of the stymie discussed. There is, as a matter of fact, a reason historically logical, why the stymie should never have become a part of the game, is not a proper element of it, and should be removed as soon as the amputation can be accomplished without disturbing the world-wide uniformity of the game.

Golf differs from most recreations in many respects; in one respect it is entirely different from all other games played with a bat and ball—such as baseball, cricket, lacrosse, polo, hockey, tennis, croquet, billiards, pool, etc. That is a sweeping statement and sweeping statements, when substantiated, deserve serious consideration. When anything differs from all other things of its kind in any one respect, that respect must be an important one. Golf differs from all other games played with a bat and ball in that nothing which either player does directly affects the other. The game is utterly individual. Each contestant must observe the effect of his opponent's play without interference, and with the self-control of a stoic. Then immediately he has to make his own performance in sharp contrast, again without hindrance; Epicurean now, he must achieve "Pleasure by avoidance of trouble." This demand upon the psychic forces of the player is the essence of the charm of the game. Without this, would hundreds of thousands of serious-minded, purposeful men and women become absorbed in agitating a small object from point to point over a well-kept sward? But there is one exception—neither player interferes with the other's game except in the case of the stymie. When the position of one player's ball interferes with the execution of the other's shot, strict individuality of play ceases. The stymie thrusts across and violates the very principle of golf which distinguishes it from all other games.

I said in the beginning that the stymie is historically illogical. All things have a beginning, and the first stymie established the custom. This was the way of it (why not?): The Dominie and the Major came to the last green all square. The Dominie putted and his

ball came to rest between the Major's and the hole. The Major, honest soul, said, "Ye maun lift yir ba." "Na, na," quoth the Dominie, "putt ut as ut lies." The Major weakly yielded (he deserved to lose the match) and an anachronism crept into the game of golf. British love of status quo has kept it there ever since; but they cut off a king's head once, when he displeased them, and perhaps we can persuade them some day to abolish the unfair, unscientific, and iniquitous stymie.

Mr. Anderson proposes that the U. S. G. A. legislate against the stymie. Emphatically, no. Let golf be the same game the world over. Let us not repeat the history of football. Let every golf club in the association take a postcard vote by its members on the question, "Should the stymie be abolished?" Let the clubs forward the results to the central body. Let the officials then report to St. Andrews the state of mind in this country and ask for a similar test of English, Canadian, and Australian public opinion. So we would correct the history of the game and not make new history. W. R. T.

THE ART OF MISQUOTATION.

To the Editor of The Nation:

Sir: The reviewer of Hutchinson's "Life of Sir John Lubbock (Lord Avebury)," in your issue of July 15, tells us that, "although he was distinguished in many ways, his name became almost a household word as the author of 'The Hundred Best Books' and 'The Pleasures of Life.' He was an omnivorous taker of notes, and he had the faculty of seizing on the books and quotations which would appeal to the best popular taste. As a result he wrote these books with almost no effort."

A little effort is, however, required from even the most facile and best documented of writers. Sir John Lubbock's faculty of seizing upon quotations which would appeal to the best popular taste affords no guarantee for the accuracy of their form when they appear in his books. By that time they have occasionally suffered a sea-change into something not "rich" though "strange."

Thus, at page 106 of the forty-first edition of "The Pleasures of Life," published by the Macmillan Co., there may be found, in a chapter on "Poetry," the following verse which is attributed to Wordsworth:

> I think of Chatterton, the marvellous boy,
> The sleepless soul, that perished in his pride;
> Of Burns, that walked in glory and in joy
> Behind his plough upon the mountain-side.

A reference to Wordsworth's poem "Resolution and Independence" will show how wide a departure the above is from the original.

On the same page is an alleged quotation from Coleridge: "that which comes from the head goes to the heart." There is a proverb centuries old, based upon universal experience, that "what comes from the heart goes to the heart" ("was vom Herzen kommt, das geht zum Herzen"). The supposed saying of Coleridge given above appears to be a distorted version of this aphorism.

The author of "The Pleasures of Life" sins, however, in good company. A few illustrations will suffice. Prof. Thomas Arnold, in the article on "English Literature" in the ninth edition of the "Encyclopædia Britannica," says of Chaucer that he "saw life *thoroughly* and saw it whole," evidently imagining that he was borrowing a line from his brother's sonnet "To a Friend," but Matthew characterized Sophocles as one "who saw life *steadily*, and saw it whole."

Matthew Arnold himself gives two lines of Keats, in his essay on Maurice de Guérin, as follows:

> moving waters at their priestlike task
> Of cold ablution round Earth's human shores.

This is by no means an improvement on the poet's expression "*pure* ablution."

R. W. Shannon.

Regina, Sask., July 21.

A PLEA FOR LAWLESSNESS.

To the Editor of The Nation:

Sir: As the *Nation*, I know, endeavors to be sane at all times, perhaps you will permit me to say in print that of the twenty or thirty people with whom I have discussed the Frank case I have found only one who did not thoroughly approve of the lynching. They, furthermore, considered it a most justifiable rebuke to the outside influence which tried to settle the case and to Slaton, "che fece per viltat' il gran rifiuto" W. H. Allen.

Woodhaven, N. Y., August 19.

Literature

A GERMAN MADE, NOT BORN.

Immanuel Kant. By Houston Stewart Chamberlain. Authorized English Translation by Lord Redesdale. 2 vols. New York: John Lane Co. $7.50 net.

Mr.—or, as one should doubtless rather say, Herr—Houston Stewart Chamberlain is a phenomenon more instructive than the books he writes; his career, indeed, tends to refute the most characteristic teaching of his books. He has been one of the chief apostles of a great nineteenth-century superstition, which has had no small part in producing that tragic madness now raging throughout Europe—the superstition of race. His "Foundations of the Nineteenth Century" is among the most extreme, as it is among the most celebrated, expressions of the belief that there are specific ideas, modes of thought, or types of culture which are the peculiar possession of particular races or nations; that a *Weltanschauung* is somehow transmitted through the germ-plasm as an ethnic character; and that the salvation of humanity therefore depends less upon the diffusion of truth than upon the perpetuation and dominance of the stocks which are the hereditary custodians of truth. Thus, as he tells us, "a final judgment shows the intellectual renaissance" of the later Middle Ages "to be the work of Race, in opposition to the universal Church which knows no race." Yet earlier the Roman Empire "was the embodiment of the anti-national principle; this principle led to racelessness and simultaneously to intellectual and moral chaos; mankind was rescued from this chaos only by the more and more decisive development of the opposite or national principle." It is by Race that the individual as well as the species is saved:

> The man who belongs to a distinct, pure race never loses the sense of it. The guardian angel of his lineage is ever at his side, supporting him where he loses his foothold, warning him where he is in danger of going astray, compelling obedience, and forcing him to undertakings which otherwise he would never have dared to attempt. Race lifts a man above himself.

And by a race Herr Chamberlain means not only such a broad generic type as *der Germane*, of which all the peoples of Northern Europe are representatives, but also individual nations. "It is almost always the nation as a political structure that leads to the highest and most individual activities of race." It is an absurdity to maintain "that a nation of such distinct individuality as the English does not represent a race." "The English people, the Prussians, and the Spaniards have a distinct and absolutely individual character."

Now, to one of these "distinct, pure races" Herr Chamberlain belongs—to that one which, not long since, he was still disposed to regard as "the strongest in Europe." Yet, unlike the hero of "Pinafore," he has been quite unable to resist the temptation to belong to other nations; from a Briton *pursang* he has been spiritually translated into a character *plus Prussien que le roi de Prusse;* and "the guardian angel of his lineage" has of late been prompting him chiefly to disquisitions upon the nature and causes of the moral depravity of the race from which he descends. The son of an English admiral, and member of a family long distinguished in the British naval and military service, he settled in Germany at an impressionable age, read deeply in German philosophy and literature, and experienced the full tide of those new ideals, enthusiasms, and intellectual fashions—nearly all of them strongly impregnated with a sort of mystical nationalism—which swept over Germany after the Franco-Prussian War. The consequence is that he is one of the most conspicuous recent evidences of the fact that "national" traits of mind are chiefly the products, not of heredity, but of training, of the intellectual atmosphere a man breathes, of social suggestion in all its myriad forms. With the late Professor Cramb, with Professor Münsterberg, with our own Professor Burgess, he serves to show how little the possession of habits of thought or tendencies of feeling which all the world at present labels "German," is dependent upon race. Herr Chamberlain, meanwhile, has done much to intensify among his adoptive countrymen the tendencies which he has acquired from them; he has lent to some of their least rational and most dangerous enthusiasms the welcome ardor of a convert. His "Grundlagen" is reputed to be especially admired by the Emperor; and that exalted disciple has shown so much missionary zeal for the propagation of this gospel that he is said to have incontinently bestowed a copy of the book—two ponderous volumes in German—upon an American business man who was granted an audience for the purpose of soliciting the imperial patronage for an American world's fair.

Even the philosophy of Kant is, in the present work, represented as significant

chiefly by virtue of its relation to the anthropological conceptions of the "Grundlagen des 19ten Jahrhunderts." Kant is the Teutonic philosopher *par excellence;* and therefore—any reader of the former book might readily have predicted this—he is the complete antithesis to all that is Semitic in philosophy and religion. It is through his doctrine that "we may emerge washed and purified from Semitic delusions after milleniums, able to adopt as our own that most modern form of primeval Aryan religion which is accurately fitted to the thought of the living present." The Kantian "idea of God is the direct contradiction of the deity of the Jewish Thorah, which to this day poisons our religious conceptions and with them all our conscious and unconscious thinking." Judaism, however, is not the only enemy of the true Germanic spirit. "The empire of intellect raised by the Teuton, the first systematic attempt to make and educate a really free, inwardly free, race," is, like his political empire, threatened by a veritable *Einkreisung* by hostile powers: clericalism on the one side, on the other "a so-called empirically scientific philosophy—a philosophy which is nominally empirical, but solves everything in abstractions and hollow balderdash." Herr Chamberlain, however, is not long content with a mere analogy between national and philosophical antagonisms; he soon slips back to his characteristic method of literally identifying them:

> Such is the state of things in the life-giving centre of Western Europe. All round is a swarming population of Tartarized Russians, a lovable people, richly gifted, though brought up and emasculated in the most contemptible superstition, in un-freedom and ignorance, destroying with the sure instinct of slaves every racial element that had up to the present given it strength and importance; far away across the world the busy, soulless yellow race; the dreaming, weakly mongrels of Oceania and South America; finally, the millions of blacks, poverty-stricken in intellect, bestially inclined, who are even now arming for the war of races in which there will be no quarter given. The man who with an open eye looks round the world to-day, a century after Kant's death, will shudder to the marrow of his bones. No danger from outside would be invincible if we true men of northern Europe, not contaminated by the slavish blood of Syria and Carthaginia, the *homines Europæi* of Linnæus (Teutons, if we only understand the word with sufficient largeness)—no danger from outside need be feared if we only had the courage to stand united and strong in the possession and in the consciousness of a freedom won, never to be lost.

How ineffably in the humor of latter-day Germany that is: the pseudo-scientific air of it all; the naïve confusion of philosophical with enthnological categories; the preoccupation with the idea of race, the hypertrophied racial self-consciousness; the national arrogance strangely combined with a panicky apprehensiveness and a habit of seeing imminent hobgoblins—Slav perils, yellow perils, black perils—on every side; the honest inability to understand the modes of thought and life of alien peoples or to conceive that the diversity of human types is a thing worth conserving; the earnest sense of a mission to save culture, otherwise in danger of perishing from the earth; withal, the touch of self-complacent cant, the loving rolling under the tongue of those blessed Teutonic words, *innere Freiheit!* How much does such a passage—written in 1905—help to make intelligible the recent conduct of the German educated public!

Towards Kant, Herr Chamberlain takes, of course, the orthodox attitude. Kant was "the keenest analyst of all times." The categorical imperative was "the sublimest thought that ever, since the days of Christ, has been thought by man":

> Right is on the side of the man with the strong fist; yet with improved lyddite bombs and such weapons we may rise superior to him; but the man with a strong head is a cosmic phenomenon, just like the sun or the dog star; he is HE; taken as a personality he is neither right nor wrong; if we wish to understand him, we must look upon him as something that is, not as something which is yet to be; he is eternal.

Whence, except from a mind that had acquired its temper in Germany, should we be likely to get quite so turgid a dithyramb, quite so extreme a manifestation of the craving to lose intellectual self-possession in an ecstasy of hero-worship—and with the worthy metaphysician of Königsberg as its object? Kant was a highly important modern philosopher; but it would need to be a small and peculiarly Germanic cosmos in which he could appear as a figure of cosmic grandeur. His personality, though, in the main, eminently deserving of respect, was meagre in its sympathies, not magnanimous, stiff, with a touch of pedantry. His one opportunity of heroic action in defence of freedom of thought and teaching he lost, exhibiting instead an unadmirable mixture of submissiveness to authority with a sort of verbal trickery. And, however significant and valuable some of his speculative *aperçus* may—or may not—be, he is scarcely the exemplar of "the man with the strong head"—unless "strength of head" carries with it no implication of clarity. There have been few professional logicians capable of such depths of logical muddle and confusion as may be found in every part of the "Kritik der reinen Vernunft." If Kant achieved new and important insights—which is debatable—it was usually more by good luck than by intellectual good management.

Herr Chamberlain's method of elucidating Kant requires that some six hundred pages be devoted to essays on Goethe, Leonardo, Bruno, Descartes, and Plato, before Kant himself is directly dealt with. The reader will therefore find in the book a more diversified range of topics than the title might lead him to expect. The interpretation of the Critical Philosophy to which all this leads need not be set forth here; it is not, in the reviewer's opinion, of great importance. This opinion, it should be said, is not shared by the author. He does not hesitate to declare that the true meaning of Kant's doctrine is now for the first time disclosed. "Upon the living centre of Kant's way of looking upon the world" the reader is warned that he "will find little or no instruction in the writings of the professional philosophers." "The starting-point of Kant's whole thought" has hitherto "been left almost universally ignored or misunderstood." "We hold centenaries in honor of Kant, but of his personality, of his philosophy, we know little or nothing." "To break this ban" was the task set himself by the author. Nor is it Kant alone whom Herr Chamberlain conceives himself virtually to have discovered. "The true Descartes," too, is "as good as unknown"; "few of our professed philosophers are so equipped as to be capable of understanding Descartes." Those, therefore, who are disposed to take the book at its author's valuation, may expect to find in it a contribution of unprecedented importance to the history of modern thought.

The translation so far transcends in badness the average badness of translations from the German that it deserves some special comment. Its most extraordinary eccentricity is the constant rendering of *Erkenntnis* by "recognition"; thus *erkenntniskritische Untersuchungen* becomes "investigations in the criticism of recognitions"! The book abounds in such schoolboy blunders as "worldly wisdom" for *Weltweisheit*, "scholasticism" for *Gelehrsamkeit*, "unanswerably careless" for *unverantwortlich vernachlässigt*, "covering name" for *Deckname*. The sense of the original is constantly missed; for example, where the author speaks of "the germ of the entire 'Kritik,'" the translator converts this into "the germ of all criticism." As for English grammar, Lord Redesdale's conception of its possibilities is illustrated by the following sentence: "Kant defines culture as 'the bringing to the front of the aptitude of a reasonable being for any and all object, consequently in its freedom.'" Yet the translator declares that the author "has read the translation from Alpha to Omega" and has certified to its "exactness." This, if literally true, can only mean that the author has become so thoroughly expatriated that he has in great part forgotten his native tongue.

CURRENT FICTION.

Penelope's Postscripts. By Kate Douglas Wiggin. Boston: Houghton Mifflin Co.

After twenty-odd years of intermittent flow, the stream of Penelope's experiences runs rather thin and pale. The truth is, Penelope is already a trifle antiquated. Her piquancies and audacities have been possibly imitated, certainly outdone, by a multitude of feminine successors on the page of fiction. Beside them she appears retiring, almost commonplace. Conventional standards have so far shifted that she no longer appears so delightfully near the ragged edge. Her very witticisms are of a fading fashion, and we blush for the feeble limericks and anecdotes with which she is fain to enlarge

these concluding pages of her confidences. At least we understand them to be concluding pages, though a Penelope would be quite as easy to resuscitate as a Sherlock Holmes or an Allan Quatermain. They certainly give us, within reasonable limits, the "ever after" of Penelope and her friends. After sundry rather perfunctory journeyings, in Venice, Switzerland, Devon, and Wales, dressed out in the whimsical manner (as far as her author can achieve it) of the Penelope of old, we get a glimpse of the wanderers at home. Francesca is married to a minister of the Established Church of Scotland, and by exceeding virtue lives down the American splendors of her clothes, before the eyes of an Edinburgh congregation; Solemina yields to a middle-aged widower whom she has loved from youth, a professor in Trinity College, Dublin. Upon Penelope herself, now Mrs. Beresford, and mother of several children, the curtain falls in an idyllic posture in a New England orchard surrounded by her adoring husband and babes.

Michael O'Halloran. By Gene Stratton-Porter. New York: Doubleday, Page & Co.

Anne of the Island. By L. M. Montgomery. Boston: The Page Co.

If it is painful to reflect that the better order of American fiction has become almost hopelessly feminized, it is still more ominous that the same thing should be happening to popular fiction. Melodrama has its faults, but it is not all slush and mush; at its best there is a kind of male strength about it. Perhaps it is better that the national type of auditor should be even the tired business man, rather than the silly high school girl—the flapper, as Britain hath it.

We have here the latest goods of two successful dealers in flapper literature. They have established their "line," and have only to keep up the output. The author of "Michael O'Halloran" is no doubt remembered by many grateful hearts as writer of "A Girl of the Limberlost" and "Freckles." She is mistress of a recipe of cuteness, triteness, and sentimentality which cannot fail. Her persons and plots may be absurd, her manner ridiculous, a compound of the comic supplement and the ladies' supplement—so much the better. Machael O'Halloran's newsboy rigmarole cannot be too boldly contrasted with the real elegant language of her ladies and gents.

"Happily," says the hero, Douglas Bruce, to his potential father-in-law who has just offered him a political job, "happily, I have sufficient annual income from my father's estate to enable me to live until I become acquainted in a strange city, and have time to establish the kind of business I would care to handle. I am thinking of practicing corporation law; I specialized in that, so I may have the pleasure before very long of going after some of the men who do what you so aptly term the dirty jobs."

"A repetition of the customary chorus," replies Mr. Winton, "differing only in that it is a little more emphatic than usual. I predict that you will become an office-holder, having party affiliations, inside ten years."

Michael is a little more amusing than this, in spots, but this orphan newsboy who adopts and rears a slum child has as little reality as Little Lord Fauntleroy. The ridiculous episode of the rich Minturns who permit their youngest child to have her skull cracked by a French maid, and conceal the cause of her death, again brings home the truth that people of wealth and fashion are commonly brutes and wantons, while newsboys and beggar maidens vainly set them examples of virtue and good manners.

Miss Montgomery's Anne of the Island is of course none other than the Anne of Green Gables and of Avonlea, who has hitherto found a market (say her publishers) to the tune of some half a million copies, and who threatens to become another Elsie for sequels. She is here brought to the verge of matrimony; so the worst may be over, since this is the kind of fiction which naturally ends with wedding bells. It is an altogether foolish and adequate account of Anne as a "co-ed." An adoring Gilbert appears on page three, who is clearly Anne's chosen, but, of course, the author puts him off by a series of transparent expedients till it is convenient for him to do the trick. It all "comes out right" in the end, which is the main thing. All that is desirable in this kind of fable is a perfunctory fumbling with obstacles in the interest of sentimental contrast.

AN IMPUDENT FRAUD.

The Secrets of the Hohenzollerns. By Dr. Armgaard Karl Graves. New York: McBride, Nast & Co. $1.50 net.

This volume would not be worth noticing in a review were it not for the fact that the unwary reader is likely to be deceived by the author's apparent possession of a great amount of secret and accurate information. The bald statement, however, of his most important "secrets," when stripped of the apparently circumstantial detail which he freely invents to suit his purposes, is sufficient to show their absurdity. Thus, though it is well known that Bismarck settled the *Kulturkampf* himself in the late 'seventies, "Dr." Graves transfers the whole question to the 'nineties, and has Emperor William II settle it by a personal visit to the Vatican (pp. 39-43). The present war was caused by the Czar's confessor, who felt himself insulted at not being allowed to board the yacht Hohenzollern by the gangway reserved for royalty (pp. 78-84). The Archduke Frederick (*sic*) and his consort were sent to their death at Sarajevo because it was so willed by one of the lady-friends of the Emperor of Austria (pp. 84-87). The German Crown Prince was banished to Danzig (*sic*) after his father, discovering him in the rooms of an (unnamed) American girl, "had hauled off and planted a resounding whack on the left side of his son's proboscis" (p. 92). The Crown Prince Frederick became an enthusiastic advocate of the Franco-Prussian war because he was refused a dance by Empress Eugénie when he went to a ball in Paris in disguise (pp. 96-97). Most ludicrous, perhaps, is "Dr." Graves's explanation of Madame Caillaux's shooting of the editor of *Figaro* (pp. 116-139). Emperor William II went to Paris incognito to talk with M. Caillaux; the meeting was discovered by M. Calmette; as it would never do for the existence of such a meeting to be made public, the German Government secretly egged on Madame Caillaux to assassinate M. Calmette. On one page the knowing author states that "it is a notorious fact that wars and acts of aggression are never entered into by the Hohenzollerns until they have reached the age of forty" (p. 12); a little later this same "notorious fact" becomes "the greatest secret of the Hohenzollerns" (p. 98). Of course, this fact is not a fact at all; for, to mention only the Kaiser's two most illustrious ancestors, the Great Elector was only thirty-one when he made a war of aggression on Neuburg, and thirty-six when he treacherously attacked Poland; and Frederick the Great was only twenty-eight when he began the notorious Silesian wars of conquest.

The author's *modus operandi* would seem to be to take some well-known event and then to draw from his own fertile imagination a wild, romantic explanation for it. Intermingled with the resulting "secrets" is a strange mixture of gossip, platitudes, and political sense and nonsense, such as a porter or courier might overhear in lobbies and smoking-rooms of European hotels. To give an air of verisimilitude to the unwary, "Dr." Graves strews his pages glibly with foreign names and expressions in italics, but it is characteristic of his carelessness and ignorance that most of these are misspelled. He is equally in error in thinking that the Blacks and Clericals are distinct parties (p. 35), that Bismarck's successor was von Hohenlohe (p. 37), that Sir Edward Grey is an earl (p. 95), that "Dalmatia is purely Italian in intent and proclivities" (p. 217), and that "analogous" is synonymous with "conglomerate" (pp. 214, 217). The "Pariser Bahnhof" in Berlin, of which he speaks familiarly (p. 132), never existed, nor would the Emperor starting on his alleged journey to the Vatican depart from "the *Lehrter* (depot)," (*sic*, p. 39). When the author's statements are particularly untrustworthy he has the impudence to add a footnote asserting his personal part in the affair as proof certain of his veracity. "The author himself carried the documents" which were to insure the neutrality of Italy in the present war (p. 200); "The author was instrumental in gathering information" which enabled the Hohenzollerns to prevent a marriage between the Belgian royal family and a German house, "thus frustrating a hope of the Braganzas (*sic*) of making the two countries one" (p. 193).

Aside from other considerations, the author's charlatanry is sufficiently indicated by his presuming to reproduce the Kaiser's exact words, with quotation marks, at most secret interviews when no one was present

except the chiefs of the secret service. So we see the Emperor "pounding the table" and defying both grammar and philology as he curses, "*Beim Annherrn* ("by my ancestors," *sic*, pp. 127, 131). "Dr." Graves likewise describes a very select dinner given to Prince Henry of Prussia by the late J. P. Morgan; after the Prince had "sojourned to the bar where three Scotch and sodas were imbibed in as many minutes," questionable stories began to circulate, the atmosphere became "pretty torrid," dress-coats were "peeled off," and the great financier announced dinner with the words, "Come on, boys, and grab some eats" (p. 233).

The really astonishing thing is that a self-respecting publishing house should issue such a book under any other guise than fiction.

REALISM AND FANCY.

Borderlands and Thoroughfares. By Wilfrid Wilson Gibson. New York: The Macmillan Co. $1.25 net.

This latest volume of Wilfrid Wilson Gibson, author of "Daily Bread," "Fires," and "Womenkind," shows improved workmanship, with no loss of vigor in expression or imaginative fancy. The longer and more ambitious pieces constituting the "Borderlands" are markedly superior, in almost every way, to the cruder and more laborious sketches of the "Thoroughfares." Unequal as his work yet is, there can be no question of poetic ability. "The Queen's Crags" is a most effective bit of swift and vivid descriptive dialogue between an old hind and a young one on the Westmoreland Fells. For the most part it is the simplest prose chopped into irregular lengths, but it is good prose, singularly appropriate to the speakers and the wild environment, rugged and crisp, and constantly illumined by flashes of pictorial suggestion. The spot is associated with a legend of Arthur and Guinevere, the time is midsummer eve, and the talk is of queens. The old man, garrulous, tells how in his youth he was enamored of a gypsy queen in a circus, and his description of the dazzling creature in the arena, in the curtest and homeliest phrases, is a striking example of realism gilded by fancy. Once again, with his wife by his side, he encountered his charmer, crippled and broken, but still able to bewitch him, with the glory of her eyes and teeth and shining black hair. The young man, a dreamer, tells how, in a thunderstorm, he surprised Guinevere herself, in a secret cave, seated, like the circus majesty, on a golden throne, combing her golden hair. A second time he saw her, in the open, and he is confidently awaiting a third encounter. In his relation there is the happiest combination of simple speech with aptness of natural imagery. Suddenly the pair are confronted by the apparition of a queenly form framed in the rays of the setting sun, who presently is revealed as a local beauty, the red-haired Peggy Haliburton. The blend of realism and fancy is, throughout, exceedingly felicitous.

"Bloody Bush Edge," the longest piece in the collection, exhibits a similar power of poetic description in blunt phrasing—though it contains several passages of pure poetry—but is chiefly notable as a study of contrasts in habit and character. Virtually a dialogue, the interlocutors are a half-witted vagabond and a cockney criminal tramp, who meet at midnight on the moors on the Scottish and English border. Daft Dick, whose only industry is poaching, is a voluntary denizen of the wilds, loves no roof but the sky, is familiar with every border legend, and peoples his haunts with ghosts of which he has no dread. The tramp, gutter-bred, is only happy in the crowded slums of cities, from which he is driven by the police, loathes solitude, and is a prey to every superstition. The cough of a sheep has sent him floundering, in breathless terror, through bog and heather, until he stumbles upon the irresponsible and fearless Dick. The conference between the two is delightful in its naturalness and psychological insight. Mutual confessions lead to mutual recriminations. Dick tells stirring tales of reivers' forays and ghostly sallies, until his companion's nerves are all on edge, and finally starts him scampering anew through bog and brake to avoid the onset of phantom beeves. Pregnant speech, atmospheric verity, and vivid imagery contribute to the dramatic interest.

In "Hoops," a wastrel hunchback—once a gentleman, now a circus stable-hand—rallies a stalwart clown, who is downhearted because he has, for the first time, missed a hoop and fears the approach of physical decay. Here, too, the power lies in the apt expression of picturesque and vigorous thought in rugged lines, but occasionally the educated cripple rises to flights of eloquent and musical verse. In describing the elephants and camels, among which his lot is cast, he contrasts the brutes in realistic and apposite terms which Kipling could scarcely better, but when, in fierce contempt of the sturdy clown's lament and his own warped trunk, he expatiates upon the privileges and beauty of perfect manhood, he speaks with pathos and melody. His visions of a Mediterranean diver, a dancing fisherman, a cragsman of St. Kilda, a Cleveland puddler, a marble Hermes, and a dream figure of Diana are pen-pictures of great beauty and distinction. The philosophy of the poem is sane and virile.

The shorter pieces of earlier date, in "Thoroughfares," are mostly thumbnail sketches, suggested by incidents of city life. The best of them, however, "The Vixen," "Ragamuffins," and "The Goose," are of the country and owe no inspiration to the town. Mr. Gibson is at his best when nearest to nature. His mastery of pungent and significant vocabulary is exemplified in many of his fragments, but most of them, even when graced by touches of fresh imagination, are labored, artificial, and extravagant. As studies in concentrated expression, they are often interesting, but they resemble exercises rather than the fruit of inspiration.

DR. BILLINGS.

John Shaw Billings: A Memoir. By Fielding H. Garrison. New York: G. P. Putnam's Sons. $2.50.

Even in our American life, where versatility is prized as a mark of leadership, it is seldom that one of our great men wins real and lasting distinction in more than a single calling. One of the rare exceptions to this general rule was the threefold career of Dr. John Shaw Billings, who, as an operating surgeon in the Civil War, attained the front rank of his profession, in later years became perhaps the foremost medical bibliographer of his time, as well as one of the ablest of hospital administrators, and died as the executive head and organizer of one of the world's great libraries. Nor was he merely a coördinator of other men's learning; by right of his own sound wisdom and practical sense he was an authority in hygiene, consulted and respected by European scientists as were few other Americans. Although never a practicing physician, Dr. Billings was one of the small group who to Europe represented the medical profession of the United States. The late Dr. Weir Mitchell, his life-long friend, was another member of that group.

An authorized account of Dr. Billings's life and labors has been prepared by Dr. Fielding H. Garrison, of the Surgeon-General's Office. This volume naturally emphasizes the importance of Dr. Billings's earlier services, some of which had been partially lost sight of in recent years amid changed scenes and activities. Fortunately, letters and journals were available, and Dr. Garrison has utilized these and similar materials to good purpose. In the main, they tell the story.

Born in southeastern Indiana, in 1838, young Billings, in his early struggles for an education, faced conditions that we commonly associate with frontier life. He worked his way through Miami University at Oxford, Ohio, and then through the Medical College of Ohio at Cincinnati. The outbreak of the war in 1861 found him a graduate in medicine and a demonstrator in anatomy at his medical college. He volunteered as an army surgeon, and after examination was appointed first lieutenant and assistant surgeon. Before the ink on his commission was dry he was placed in charge of Cliffburne Hospital, at Georgetown, D. C., which he developed into one of the most important of the army hospitals surrounding the Federal capital. That so young a man—he was then only twenty-four—with no previous military experience or training, should have such responsibilities literally thrust upon him early in the war, was not an altogether exceptional instance; what was really significant was the masterful way in which this young man dominated the situation, created order and system, inspired those about him with his own sense of loyalty to his calling, and accepted the most exacting duties with the easy self-confidence of a veteran in the service.

Dr. Garrison's account of the young army surgeon's experiences (one of the few contributions to that branch of Civil War history) is noteworthy more as a study in administration, and a picture of conditions in time of war, than for any light that it throws on the professional practice of the time. In a day when antiseptic surgery was unknown, we can only wonder that the percentage of deaths was not far greater than it was. At Chancellorsville and Gettysburg Dr. Billings performed many operations with a success that shines the more brilliantly against the limitations and handicaps of improvised field hospitals (at times under fire) and the myriad distractions of battle.

The war ended, the scene of action is shifted to the national capital, where for thirty years Dr. Billings, remaining in the army medical service, found his opportunity for working out original plans for the advancement of his chosen science. At first there was everything in his duties and environment calculated to smother ambitions of that kind. An associate described his work at that time as "arid drudgery among invoices and receipts, requisitions and bills of lading, treasury drafts and auditors' decisions." This was not a favorable atmosphere for either the conception or execution of scientific undertakings; yet it was during these years of tiresome routine and grind that Dr. Billings blocked out the "Index Catalogue" of medical literature—a work which within a very few years gave him a place among the foremost bibliographers of any age or country. The library of the Surgeon-General's Office, growing rapidly under his direction, was the basis of this work, but the compilation of such a catalogue was a distinct service to medical science throughout the world and has been so recognized. It was admirably supplemented by the monthly *Index Medicus*, conducted for many years by Dr. Robert Fletcher, a colleague, and at present edited by Dr. Garrison, the author of this memoir.

Here was a man whom the routine of office could not confine. Such was the range of his interest and his zest for constructive learning that within the first decade of his life in Washington he had gained a national reputation as an expert and statistician in hygiene and sanitation. As an outcome of this came the call to supervise the erection and organization of the Johns Hopkins Hospital at Baltimore. This was a task that called for the best that was in him. It demanded a dozen years of planning and building and then the assembling of a faculty and staff and the creation of a school of medicine such as this continent had never known.

Dr. Billings had behind him a record of thirty years of constructive effort when, at the age of fifty-seven, he was called to the directorship of the New York Public Library, created by the merging of the Astor, Lenox, and Tilden foundations. After his retirement from the army, he devoted the last seventeen years of his life to a task that might well have demanded the energies of a younger man—a task, too, that revealed in the doer unsuspected abilities. In the planning of the great central library building and the system of circulating libraries made possible by the Carnegie bounty, Dr. Billings rendered an enduring service, which New York has not failed to recognize. Indeed, those achievements of his later years are so well known that Dr. Garrison seems to have thought it unnecessary to give as much space in the memoir to their recital as to the matters already mentioned. In this judgment most readers will probably concur; yet we could have wished a somewhat fuller presentation of the views of library management and the relations of a library to its constituency that prevailed in fixing the policy of so important an institution as the New York Public Library.

Surveying this unusual career as a whole, one can hardly avoid the conclusion that its chief distinction was in the two fields of bibliography and the administration of hospitals, rather than in librarianship. The New York Public Library would somehow have been set going by other hands. There were helpful models already in operation, Boston and Chicago, for example. But it may well be questioned whether any other American could single-handed have originated an "index catalogue," or built the Johns Hopkins Hospital in the '70's and '80's of the last century.

An important feature of the memoir is a bibliography of Dr. Billings's writings prepared by Miss Adelaide R. Hasse. There is also a genealogy of the Billings family in America.

MISSIONARY INDIA.

The Arya Samaj: An Indian Movement. By Lajpat Rai. New York: Longmans, Green & Co. $1.75 net.

India: Its Life and Thought. By John P. Jones. New York: The Macmillan Co.

Written from rival camps in the world's oldest mission field, these two books lend themselves to an intimate juxtaposition. For the student of missionary India each complements the other, and to our mind they adumbrate the same idealism. Both writers have worked passionately for India's future. Mr. Rai's endeavor, backed by an aggressive society in its purpose of reviving Hinduism to its pristine, intellectual standard, has, on one occasion, led to his summary deportation by the British, while Mr. Jones records the experience of a long exile as a Christian missionary-educator. Both writers give a definite idea of the political, religious, and intellectual ferment now agitating India.

It would be misleading to indicate that these or recent writers on India report a great, widespread renaissance: the fact remains that, besides lacking homogeneity, India's submerged masses proportionately equal China's. Not for another decade will the beginnings of compulsory education, as incorporated in the late Mr. Gokhale's tentative bill, bear fruit. And yet the latest Blue Book is sanguine, stating that since 1912 the total amount allotted for education has grown from 3¾ to 5¼ millions sterling. These figures are, of course, hopelessly disproportionate to the illiterate masses of India, yet Mr. Jones's discouraging statistics "that only 1 in 10 of the males, and 1 in 144 of the females can read" may rapidly become obsolete. The phenomenal growth of literates in India, due to greater social fluidity and the spread of modern ideas, is perpetually flouting the statistician. What the bazaars accomplished of old is now augmented by a growing vernacular press and increased facilities for travel. Of the Indian press Mr. Jones remarks that in hardly any country does it enjoy greater liberty, and "there is no land where that liberty is more abused."

The two books are thus concerned with those vitalizing currents which are at work upon the vanguard of India's reformers. Both writers, however, tell us from a full experience that these manifestations are not, as the cables infer, an expression of a united India, but rather of her intellectuals. In Mr. Jones's more comprehensive study we are immediately plunged into the matter of India's unrest, while Mr. Rai tacitly admits that his society has been suspect of the British. It is, after all, in the manner by which she shall fulfil her promised destiny that our two authors disagree about India. Mr. Rai's hope of India's salvation is not unlike Mr. Lowes Dickinson's: his vision of her nationalization allows of any but Christian or European influences. With Mr. Dickinson he feels that, in her adoption of Western materialism, India will disintegrate, and lose her old spiritual consciousness. Mr. Jones predicts a great gain for India as a result of her contact with Christianity and Western institutions, and he attributes her awakening to a share of the present *Weltschmerz* that is obliterating the artificial barriers between East and West.

Though he is prone to a special view, Mr. Jones has given us a great deal of disinterested information. Including chapters on the political situation and on the more fortunate dependency of Burma, but omitting the nearer Ceylon, he has devoted most attention to the traditional religions of India and to her modern religious movements. Touching the question of Indian unrest, he is impartial and illuminating. While justly demanding extended suffrage and a larger share for Indians in higher administration, Mr. Jones considers them, as does Mr. Rai, their own enemies: Moderates and Radicals fail to find a common platform, and are themselves keenly sensible of this lack of public spirit. Attributing no small part of the present misunderstanding between emancipated Indians and their rulers to the traditional Anglo-Saxon self-sufficiency, Mr. Jones believes that the vital issue is the question of ultimate Indian or British paramountcy in India's administration. In this valuable political diagnosis it is a pity that he fails to estimate the new school of Indian political thought characterized by the "Servants of

India" movement, founded in 1905 by Gopal Krishna Gokhale. This political movement is strictly unsectarian, but the omission, and the absence of the great leader's name from the Index, is to be regretted. Conspicuously honored by the British, respected by Radical and Moderate for his devotion to India's cause, Mr. Gokhale's death last January is a loss that India will increasingly realize. Mr. Rai also debars the unsectarian Gokhale from his pages, though we run across the ubiquitous Tagore.

A great part of Mr. Rai's book is devoted to the life and activities of the Swami Dayananda, founder of the Arya Samaj, and a better idea of the purposes of the society is thus obtained than from the discursive pages on its subsequent growth. The Arya Samaj is a virile sign of the reaction against their own religious and intellectual decadence by advanced Hindus, and is inspired by the ruthless criticism to which that decadence has been subjected by Western scholarship. Dayananda's society questions the sources of Brahman authority, the irrelevant accretions of custom and myth acquired by the Hindu fabric under its Brahman hierarchy, and it insists upon a return to the pure inspiration of the Vedas and a pre-Brahmanic theocracy. A detailed account of its educational platform appeared in the *Nation*, Vol. 95, pp. 76-77. This propaganda of the Arya Samaj forms a considerable influence in that zone of intellectual Hinduism that is closed to Christian activity. Perhaps it is unfortunate that this theistic society should be regarded as inimical by missionaries. Mr. Jones feels "there is to-day in north India no enemy to the Christian cause so wide awake and so bitter as the Arya Samaj." Mr. Rai reminds us that his society, while opposed to Christianity and the current Hinduism, has for its chief object the reconversion of Mohammedan Rajputs to the new Hinduism.

It is significant to find in Mr. Jones's valuable chapter on these movements that caste is the issue on which there is dissent, and the steady growth of an emancipated type of Hindu must be regarded as one of the most encouraging signs of a new India. While the sturdy rationalism of this class is opposed to Christian influences, yet it is more virulent towards the discredited Hindu hierarchy of its ancestors. India will always remain the home of cults and creeds, and her complicated ethnic elements, in assuming national orientation, have now evolved numerous religious and political *samajes*, all of which greatly contribute towards her eventual emancipation. Mr. Jones loyally admits that the Arya Samaj "is a bulwark against drink, caste, idolatry, early marriages," and "vigorously promotes female education, the remarriage of widows, and various philanthropic institutions." To this we may add Mr. Rai's chary admission that "it would be futile to deny that Christianity is gaining ground. . . . It is no satisfaction to be told that the work of conversion to Christianity is limited mainly to the depressed classes."

Notes

Harper & Bros. publish this week "Pudd'nhead Wilson" in their new Limp-Leather Edition of Mark Twain.

Mr. John Trevena's new novel, "Moyle Church-Town," will be published in this country late in September by Alfred A. Knopf.

Artzibashef's Novel, "Breaking-Point," is announced for publication on September 10 by B. W. Huebsch.

Included in the list of autumn publications of the Yale University Press are the following: "Economic Aspects of the War," by Edwin J. Clapp; "Aspects of Islam," by Ignaz Goldziher, translated from the German by Kate E. Chambers; "The Hostage," a translation of Paul Claudel's "L'Otage," by Clara Bell, and "The Physiology of the Amino-Acids," by Frank P. Underhill.

The following are among the recent or forthcoming publications of Scribners: "The Freelands," by John Galsworthy; "Aunt Jane," by Jennette Lee; "The Real Man," by Francis Lynde; "Somewhere in France," a book of stories by Richard Harding Davis; "The Rose-Coloured Room," by Maude Little; a Life of Robert Louis Stevenson for boys and girls, by Jacqueline Overton; "Socialized Germany," by Frederic C. Howe; "A History of Christian Missions," by Canon C. H. Robinson, which will be followed presently by "The Latin Church in the Middle Ages," by André Lagarde.

We have received from the Oxford University Press the Oxford Edition of "The Arabian Nights," being a selection, for the most part, from Lane's translation, with 46 illustrations by A. B. Houghton and others. The price is one shilling sixpence net.

Prizes have been offered by Mrs. Harry Payne Whitney for the purpose of creating a competition in art on the subject "The Immigrant in America." For the best works in painting or sculpture the prizes are four in number, ranging from $500 to $50. There is a prize of $100 for the successful work in black and white drawing, and one of the same amount for poster design. An exhibition of the works winning the prizes and of others selected by the jury of awards will be held at Mrs. Whitney's studio, 8 West Eighth Street, from November 15 to December 15.

Incidental to the celebration of the semi-centennial of the opening of Vassar College to be held at Poughkeepsie in October, President Taylor and Miss Haight have written a history of the college for the American College and University series (Oxford University Press, American Branch). The book covers the life of the college from its beginning to the close of President Taylor's administration, and contains some preliminary discussion of the state of education for women before the opening of Vassar. It will be uniform with the earlier volumes of the series and will be published in October.

The fifth volume of the Oxford Historical and Literary Studies contains a selection of the works of Henry Tubbe, edited, with a biographical introduction, by G. C. Moore Smith. This very minor celebrity was born in 1618; was admitted to St. John's College, Cambridge, in 1635; took the degree of M.A. in 1642; was disappointed in his ambition to obtain a fellowship; abandoned his intention of entering the church, owing to the upheaval of the times and to a "scurvy cold" which never left him; and for the rest of his brief life (ending in 1655) was a retainer of some sort of the Hertfords at Essex House and then tutor to the sons of the Earl of Thanet at Hothfield. His works he left to posterity, beautifully written out in manuscripts collected in two volumes and preserved in the British Museum. One of these volumes was evidently prepared for the press and contains "Meditations: In Three Centuries," a title which immediately recalls the now famous work of Traherne. Four years after Tubbe's death a selection of these "Meditations" was printed, and a specimen of them is given in the present volume by Mr. Smith. The bulk of our reprint is from the poems in Tubbe's second manuscript volume. They have a mild historical interest, as showing the temper of the cultivated Royalist in those trying times. To our taste altogether the best of the poems is the first, which rises in some of its lines to real beauty:

> . . . when Thou & I
> That never single were, must part and dye:
> Our Friends (I hope) will be so liberall
> And kind, to let us have one Buriall,
> One Grave to blend our Ashes, as one Life
> Did mix our equall Hearts with mutuall strife
> Of friendship & Delight. There (as Wise Men
> Beleeve, that Love lives after Death) agen
> Our Spirits shall intermix, & weave their Knots;
> Free from the trouble of these earthly Grotts;
> Thence winged flie to the Elysian Groves,
> Where, whilst wee still renew our constant Loves,
> A Thousand Troops of Learned Ghosts shall meet
> Us, and our coming thither gladly greet.

Tubbe's letters, though not exciting, are of more value than his literature, and the editor has expended a good deal of diligence in weaving them into a narrative. Students of the age will find some material here, and there is a genuine human interest in the pathetic lot of this ambitious and thwarted poet.

A large part of John Burroughs's "The Breath of Life" (Houghton Mifflin; $1.15 net) consists of a delightful monologue, in which the author dwells upon the more baffling phase of the riddle of the universe. The treatment of the great mystery is not at all devotional, but is strictly reverential.

The Wordsworthian sense in nature of "something far more deeply interfused" than the principles of exact science, is probably the source of nearly if not quite all that this volume holds. To the rigid man of science this is frank mysticism; but without a sense of the unknown and the unknowable, life is flat and barren. Without the emotion of the beautiful, the sublime, the mysterious, there is no art, no religion, no literature. How to get from the clod under foot to the brain and consciousness of man without invoking something outside of and superior to, natural laws is the question. For my own part, I content myself with the thought of some unknown and doubtless unknowable tendency or power on the elements themselves, a kind of universal mind pervading living matter and the reason of its living, through which the whole drama of evolution is brought about.

The work may be regarded as a serious attempt to satisfy the mind with pantheistic conceptions, and it therefore contains many striking passages dealing with the most interesting of the modern theories of matter

and the forms of force. As might be expected, the author does not always present very clearly such obscure matters as radioactivity, the electrons, and the like, but he does not lead his readers far astray. The part of the volume which will appeal to a large number of thinkers is the chapter in which the European war is considered.

Four recent addresses by the President of Princeton are brought into a little book by Scribners with the title "The Higher Patriotism" (60 cents). "Preparedness and Peace" is the speech with which President Hibben fluttered the dovecotes at Lake Mohonk. "Might or Right" was delivered before an ecclesiastical audience. "Martial Valor in Times of Peace" is a baccalaureate sermon. President Hibben expresses with dignity and restraint the average enlightened view of patriotic Americans who are as far from militarism on the one hand as they are from extreme pacifism on the other. Of this resolute but generally silent majority President Hibben is the spokesman.

"Roger Bacon. Essays Contributed by Various Writers on the Occasion of the Commemoration of the Seventh Centenary of His Birth," collected and edited by A. G. Little (Oxford University Press), is a valuable volume, though it lacks the artistic finish appropriate in a memorial. More than a dozen British and Continental scholars have contributed papers to illustrate the many sides of Bacon's genius. The editor, Mr. Little, writes an excellent introduction on Bacon's life and works. A collection of this kind, popular in England of late, suffers almost inevitably, even after editorial revision, from repetitions, contradictions, and the lack of balance. It is like a statue on which diverse artists have collaborated, a realist fashioning the nose, an impressionist the lips, and a futurist the contour. Far better the ordinary *Festschrift,* in which the assemblage of different articles makes no claim to either unity or completeness. Or, if the raw material of the separate investigations had been turned over to Mr. Little or M. Picavet, who gives an admirable account of philosophic movements in the thirteenth century, either scholar could have produced a comprehensive, illuminating, and interesting treatise on Roger Bacon. The present work, like the various Cambridge Histories, must be consulted, but it does not invite consecutive reading.

Apart from this general criticism, we have nothing but praise for the contents of these essays. "The Influence of Robert Grosseteste" (L. Baur), "The Latin Vulgate" (Cardinal Gasquet), "Philology" (S. A. Hirsch), "Mathematics" (D. E. Smith), "Optics" (E. Weidemann), "Alchemy and Chemistry" (Pattison Muir), "Gunpowder" (Col. H. W. L. Hime), "Medicine" (E. Withington), "English Literature" (Sir J. E. Sandys)—these titles and authors indicate the range of subjects and the competency of the treatment. The composite picture shows us in Bacon a man of erudition, devoted to exactness in science, mathematics, and philology, and yet headed towards theology as the supreme goal of thought. His last dated work is the "Compendium Studii Theologiæ." Though original in methods and in observation, humanistic in his passion for texts, and notably disdainful of authority, Bacon, no less than St. Thomas Aquinas or Albertus Magnus, was committed to the scholastic programme; incidentally, the scholastic programme had room for many things. Mr. Little concludes the volume with an extremely important appendix, containing a list of Bacon's works, with references to the manuscripts and printed editions. Part of a fund has been raised to publish Bacon's still inedited treatises, a cause deserving every encouragement and, we hope, not abandoned in the grim necessities of the hour.

A book valuable as a survey of the subject indicated by its title, but more notable as a document in the debate between advocates of "dual" and of "unitary" control of the elementary and industrial schools, Frederick William Roman's "The Industrial and Commercial Schools of the United States and Germany" (Putnam; $1.50 net), represents eight years of study following the author's appointment by Kentucky to investigate European school systems. The historical survey of the development of industrial and commercial continuation schools in Germany since 1836, and the account of the more recent rise of trade schools, are pedestrian enough; and the parallel description of American industrial schools, treating those established by endowment, as the Pratt Institute and the California School of Industrial Art, the brewing schools, and other private special schools, and the recent wave of interest in State or municipal-supported vocational schools, is distinguished only by its thoroughness. Even the trade courses of the Christian associations and the work of the "business colleges" are included. An ever-present fault is the author's tendency to present a series of excerpts from the many reports and bulletins on such institutions without genuine attempt to digest them. His preoccupation with facts leads also to a neglect of theory, and of the social and pedagogical implications of the new movements. The final division, however, comparing American with German control and organization of the industrial schools, is an effective answer to those who have argued that European experience shows the necessity of putting trade instruction into the hands of joint boards representing labor and industry, while leaving the regular studies to the State. The question has had much legislative discussion of late. Mr. Roman defends the theory of "unitary" control, and shows conclusively not only that it predominates in south Germany, but that Prussia and Hessen are moving towards its adoption.

Mr. Stephen Graham's "Russia and the World" (Macmillan; $2 net), contains articles which have already appeared in the *English Review,* the *Atlantic Monthly, Harper's Weekly,* and the London *Times.* Mr. Graham has been the most prolific writer on Russia since the outbreak of war, but to many he has become a distinct disappointment and not a little of a puzzle. In his first writings on Russia he both charmed and convinced. He has seen and described one side of Russia, the Russian peasantry, which westerners have never had put before them with such force and charm, as in his "Undiscovered Russia." As other books came from his pen, one saw deeper into Mr. Graham's own psychology. He is an avowed enemy of the modern commercial spirit. When he penetrated into north-eastern Russia, it was perhaps in part to escape the materialism of his own country; he was most happy among the Russian peasants, the mystic side of their character having for him a strong appeal; he accompanied them in their pilgrimage to Jerusalem and gave a wonderful picture of these people of honest but simple faith. But, as he travelled more in Russia, he saw that "western" ideas were penetrating even into the village. The discovery grieved him, and in his subsequent writings the tendency to preach has become more and more apparent. "Russia the sanctuary from Westernism" is Graham's own phrase, and as he has found this sanctuary being "invaded," the preacher has developed into almost the crank. He departed from his original line of study, plunged into politics, and began to flounder about in a distressing manner. In the present book, one can admire the way the author has seized and described this or that fact of Russian life, but one-sided and unfair statements are numerous. Frequently we find a mere paraphrase of what we have heard from the Russian reactionaries. He does not want the Russian peasant educated: "If you educate the peasant, he will cease to want to plough . . . The peasants are happy on the land, thanks to the satisfying popular rites of their religion, thanks to village customs, village songs, village sociabilities. Do not pervert them *en masse.*" There is sufficient truth in some of what Mr. Graham says about Russia, especially about the peasants, to make one always read him carefully, but one resents his careless generalizations. The Russian peasantry is backward and still too apathetic, though there are many evidences that these faults are being corrected by the peasants themselves, on their own initiative. But Mr. Graham finds that "Russia's instinctive struggle is against 'Westernism,'" and by "Westernism" he means the very things which the best minds in Russia have been trying to develop.

There is one side of the Russian peasant's character, his strong humanity and kindliness, that Mr. Graham in his earlier books taught the western reader to recognize and appreciate. But now he tells us that "the Russian peasant soldier regards the enemy as vermin that must be destroyed"; though on the very next page we are told that "there is . . . no malice, no lust, not much delight in cruelty, but, on the other hand, no squeamishness." Again the writer contradicts himself when he discusses the closing of the vodka shops. He speaks of the "Russian nation's sudden passion for sobriety"; a few lines later he tells us that "when what was practically a national measure of local veto was adopted, the whole of Russia from Czar to peasant woman was swept with a temperance ardor . . . and long before the war thousands of spirit shops had been sealed owing to popular demand." Then we are told that "Russia was made sober not by act of Parliament, but by something more powerful than that, more ready, more simple—by word of Czar. . . . So Russia was rejoiced by the Czar, by one of the most amazing personal acts in the modern history of civilization." One must protest against the author's logic, as well as against his political theories. One regrets that Mr. Graham did not continue along his original line, and give us the results of his own actual study of the life of the Russian peasant. By his latest writings he has made many less ready to accept his judgment on this special aspect of Russian life, which he had come to know most intimately, and which he described with great accuracy and remarkable charm

"Quaint, quaint," will be the British comment of the American reader of "America of the Americans" (Scribner), by Henry C. Shelley, the latest addition to the long Countries and Peoples series. The impression will not be derived from the humor of the volume. The compiler has, to be sure, culled from his various sources many witty remarks, but they are quite by way of relief from the seriousness of the discussion. Nor will the quaintness be found in the numerous mistakes. The author does, indeed, speak of "prohibited laws" when he obviously means "prohibitive." He praises a celebrated critic under the name of Paul Elder More. He lists no *McClure's Magazine,* but does refer to *McClure's Monthly.* Surprising as such slips are, they do not betray incompetence. Mr. Shelley has prepared several books before this, and knows how to find and handle the various authorities on the phases of life in the United States which he selects for treatment. But he does betray a lack of personal familiarity with conditions here and a faultiness of perspective that at times lead to grotesque results. Of one of our newspapers he declares: "Another great service rendered by the *World* is the annual publication of its 'World Almanac and Encyclopedia,' the latest issue of which extends to no fewer than 836 pages of closely printed reading matter," and then makes the curious addition, "plus nearly 200 pages of advertisements." In discussing The Magazines he makes no mention of the *Atlantic Monthly* among either the popular horde or the three of higher grade. The superficiality of the treatment is most obvious in the chapter on Social Problems, where labor conditions and the negro question are taken up from one point of view and another with insufficient attention to consistency or to the underlying causes of unrest. It should be added, however, that the chapters are clearly written and that the insular prepossessions are a source of interest even in the unexpected prominence given to some features of our life. The thirty illustrations, chiefly half-tones from photographs, should help to clarify for English readers every subject attacked.

Two new volumes of the publications of the Champlain Society have just been issued: volume ix of the series is the second volume of Knox's "Historical Journal of the Campaigns in North America," edited by A. G. Doughty, the Dominican Archivist; volume xi is the third volume of Grant and Biggar's edition of Lescarbot's "History of New France." The second volume of Knox's Journal is devoted to the campaigns of 1759 and 1760. The editing is excellently done. There are many portraits, and some useful maps, particularly one of the Lake Champlain region. The text of this volume contains rather less of physiographical description and political and economic comment than the preceding one (see *Nation,* April 29), and its value is therefore more purely military. Besides a great number of official orders, the journal contains the text of the articles providing for the capitulation of Quebec, Niagara, and Montreal.

Of more general interest is Marc Lescarbot's charming history of New France, the present volume of which contains the most interesting part of all, the part devoted to a description of the manners and customs of the Indians. This part, the sixth book, has indeed a value for the student of the history of French thought as well as for the student of Canadian origins. The idealization of the "State of Nature" was by no means peculiar to the eighteenth century; and it is so characteristic a sentiment in Lescarbot's history that one might suppose him a contemporary of Rousseau, were it not for the quality of his prose and his attitude towards the Church and religion. He sings the praises of the simple life in opposition to the artificial conditions of French society, and of agriculture as opposed to commerce and the professional occupations, although, perhaps because, he was himself a lawyer. It is "Mother Earth" alone, he says, "that nourishes us, warms us, lodges us, is contrary to us in nothing, and she is set at naught, and those who till her are laughed at; they are placed below the idle and the blood-suckers of the people. All this is done here where corruption holds a great empire, but in New France the Golden Age must be brought in again, the ancient crowns of ears of wheat must be renewed, and the highest glory made that which the ancient Romans called *gloria adorea,* a glory of wheat, in order to invite every one to till well his field, seeing that land presents itself liberally to them that have none." It would be interesting to investigate the importance of the New World in forming that idealized conception of a state of nature which came to prove so attractive to the eighteenth century. The above passage may serve also to indicate Mr. Grant's skill as a translator. The task which he set himself, of giving the exact meaning of the text, but at the same time of preserving something of the charm of Lescarbot's style and something of the antique flavor of the prose of a past age, was a task which only a lover of literature and a historian who is deterred by no difficulties would have undertaken. It ought to be said that in this matter he has achieved a marked success. The rendering, so far as the reviewer attempted to make a comparison, is excellent, and in many difficult passages—for example, the preface to the sixth book—the English form has the identical characteristics of structure and the identical bewitching tone or timbre of the original.

Besides the publications of the Jesup Expedition (which dealt only with Northeast Siberia), we have had no description in English of the social life of the aboriginal Siberian populations. Now, in "Aboriginal Siberia, a Study in Social Anthropology" (Oxford University Press; $4), Miss M. A. Czaplicka, of Somerville College, Oxford, has brought together a large mass of material hitherto not accessible to English readers. She has utilized the labors of the large body of Russian ethnologists and anthropologists whose writings, being in Russian, are a sealed book to most European and American students. She has made a special study of Shamanism, and of the phenomena included in the designation "Arctic Hysteria." While her description of Siberian social and religious life does not pretend to be complete, her volume will be of great importance for the understanding of Northern Asia, and, it may be added, will have significance for all persons engaged in ethnological research. The value of the volume is increased by an extensive bibliography and a glossary of native terms.

The Rev. E. A. Wasson, rector of St. Stephen's Episcopal Church, Newark, N. J., has been at great pains in "Religion and Drink" (Burr Printing House) to prove that the burden of testimony in the Bible and in the writings of the early Fathers is in favor of the proper use of liquor. To this end he has collated every text bearing upon the subject in the Old and New Testaments and the Apocrypha, and has no difficulty in making out a case which, so far as it goes, is unanswerable. The churchmen of any sect who maintain that the wine used at the marriage in Cana of Galilee and at the Last Supper was unfermented, are in a decided minority, and it is doubtful whether many of them could be converted by the familiar arguments here employed. But the book is a scholarly and conscientious compilation of facts with many of which only students are conversant, and its explanation of the terms employed in the Hebrew, Greek, and Latin records are of general interest. The policy of the prohibitionists, however, does not rest entirely upon the mandates of Scripture, but largely upon questions of social, physical, and economic expediency. Nevertheless, Mr. Wasson takes a very strong position when he argues, in his closing chapters, that the best means of combating and vanquishing drunkenness are to be found in moral and religious education, not in legal authority, and that the churches especially should beware of forming any alliance with secular authority, a union which has, in the past, always resulted in persecution and abuses. Mr. Wasson, while believing that liquor is among the good gifts of a beneficial Providence, is, it should be unnecessary to add, a zealous advocate of temperance.

Written as a doctor's thesis in sociology, "The Sociological Implications of Ricardo's Economics," by Cecil Clare North (University of Chicago Press; 50 cents), proposes to round out the Ricardian literature by a chapter on the great economist's place in social philosophy. Other books have studied what Ricardo thought; this book is devoted to a study of what he did not think. For Ricardo, as is well known, based his economic reasoning on abstract hypotheses; few economists of the period before the rise of the mathematical school neglected so consistently the social foundations of economic science. The author follows a path that promises little profit. The most important part of his work has already been done for him. He holds "that the interpretation of Ricardo has failed to recognize two essentials facts . . . (1) that the Ricardian theories were worked out with special reference to specific technical measures which the author was interested in furthering; (2) that the economic data on which his conclusions were founded were not correlated with data of wider social significance." The first of these points was emphasized and illustrated by Cannan some years ago, in his "Theories of Production and Distribution"; the second has been a commonplace of economic thought for generations past. The review in detail of Ricardo's doctrines tends to become perfunctory, or to lose itself in the mist of what Ricardo seemed to think when his attention was really directed on some other object. The author does show how natural were some of the assumptions that Ricardo allowed himself; he presents a satisfactory review of the Ricardian literature, and he gives a sympathetic, even generous appreciation of Ricardo as a man.

Science

HEREDITY.

Heredity and Environment in the Development of Men. By E. G. Conklin. Princeton University Press. $2 net.

A number of publications have appeared in recent years with the avowed intention of giving a popular account of the interesting results and speculations that are current at present among specialists in biology in regard to development and heredity. Biology, in fact, has something to communicate upon these subjects, and, very properly, some of its leading workers have made the attempt to lay their results before the public. These attempts have not all been successful. It is a matter of great difficulty to present technical details to a popular audience in such manner as to be understood and yet not to depart from the lines of scientific accuracy. Professor Conklin's book seems to accomplish this difficult feat in a most satisfactory way. The author handles his material with the firm touch of one who is intimately acquainted with all its varied phases. He has been particularly fortunate in avoiding the multiplication of specific instances, a tendency that in many books of this character serves to confuse the reader. But the main facts are given clearly and attractively, and their applications to the practical sides of life are discussed in a suggestive and helpful way. The matters considered include such topics as the fertilization of the egg and the subsequent development of the body and mind of the individual, the mechanism of heredity and of sex, the explanations of hereditary resemblances and differences in the light of the Mendelian hypothesis, the influence of the environment upon development, the possibilities of eugenics, and, lastly, the bearing of all these newer facts upon the ethical sides of life. The author endeavors apparently at all times to speak as plainly as the knowledge of the question under discussion permits, so that it is not difficult to get his point of view. At the same time, conflicting speculations, old and new, are presented with a clearness and impartiality which win the confidence of the reader and tend to bring him to a sympathetic understanding of the aims and methods of modern biological investigations. It is, in fact, an admirable book that can be read with interest and profit by the non-specialist, in most parts at least. Some of the cytological details are of necessity difficult to follow for those who may not have had an elementary training in the biological laboratory. In his interesting comments upon the development of the mind and of consciousness, the author is perhaps somewhat dogmatic. It is entirely permissible to assume, as he does, that the mind, like the body, develops out of the germ, but when he states that the "elements out of which consciousness develops are present in the germ cells," and goes on to say or to imply that this conclusion is beyond controversy, he forgets for a moment the becoming attitude of the scientific man towards questions concerning which evidence is lacking or very incomplete. One may hold such a view as highly probable, but to assert that it is incontrovertible goes a step too far. We can understand very well how the various tissues may be evolved from the fertilized egg by processes of differentiation. Such changes are chemically conceivable. We can demonstrate the fact that the egg cell exhibits fundamental properties, such as irritability, sensitivity, responsiveness, and metabolic activity. From such raw material most of the specialized functions exhibited by the adult organism may readily be developed, or at least we can conceive such a course of development, and scientific observation has discovered many of the intervening stages. But who can assert that there is any positive evidence of the existence in the germ cells of a beginning of consciousness? In the denseness of our ignorance on this subject, no view can be accepted as incontrovertible. The proper attitude of mind for the scientific man is one of simple agnosticism, or, if he prefers some positive view, it should at least be stated in tentative terms.

Domestic science schools are multiplying rapidly, and with them treatises useful as textbooks. One of the most valuable and thorough of these is "Food Products" (Macmillan; $2.25), by Henry C. Sherman, professor of food chemistry at Columbia University, a volume of nearly six hundred pages of solid information on all kinds of edibles, their composition, food value, digestibility, economic importance, and the relative ecomonic importance of the industry. Lists of references appended to the different chapters facilitate further research. They strikingly illustrate the recent progress in the science of food.

Dr. Paul Ehrlich, one of the foremost medical scientists in the world, died on Friday of last week at Bad Homburg at the age of sixty-one. In 1908 he shared with Metchnikoff the Nobel prize for medicine. Dr. Ehrlich was born at Strehlen, Germany, on March 14, 1854, and was educated at the Universities of Breslau, Strassburg, Freiburg, and Leipzig. He first became famous because of his studies of blood. These greatly extended the knowledge of the cellular element of the blood, which forms so important a part of medicine to-day. John D. Rockefeller, learning of Dr. Ehrlich's contributions to medical science, authorized the directors of the Rockefeller Institute to place $10,000 at his disposal. Dr. Ehrlich was giving at the time much attention to syphilis, and aided by this appropriation he soon discovered (1909) a substance (an atoxyl derivative) which, upon being injected into the blood of a syphilitic patient, proved highly effective. A record of more than 10,000 cases showed "606"—as the substance was called from its place in a series—to meet the requirements of a cure. Dr. Ehrlich added to his fame by discovering the antitoxin for diphtheria. In announcing his discovery of nigrosin (1912), he expressed the belief that it would prove to be a cure for cancer. In 1914 he began experiments with a remedy for the sleeping sickness.

Dr. Charles J. Finlay, who first put forward the theory that yellow fever is transmitted only through the bite of a mosquito, died last Friday in Havana, Cuba, in his eighty-second year. He was born in Puerto Principe, Cuba, on December 3, 1833. He was educated at the Lycée de Rouen in France and at the Jefferson Medical College in Philadelphia, from which latter institution he received his degree in medicine in 1855. Returning to Cuba, he became one of the leading physicians on the island. He was a delegate from Cuba to the International Sanitary Conference in Washington in 1881. From 1902 to 1908 he was chief sanitary officer of Cuba, and in 1909 was made honorary president of the Junta Nacional de Sanidad y Beneficencia. Dr. Finlay was a member of the Havana Academy of Sciences, the Sociedad de Estudios Clinicos of Havana, the Société des Sciences of Brussels, the Royal Society of Arts of London, the College of Physicians of Philadelphia, and a member of the American Public Health Association. He was also a fellow of the Society of Tropical Medicine and Hygiene of England, an honorary member of the American Society of Tropical Medicine, and the Société de Médecine Tropicale of Paris, and corresponding member of the Académie de Médecine of France.

Drama

"ROLLING STONES."

Mr. Edgar Selwyn's play "Rolling Stones," which had its initial performance last week at the Harris Theatre, is above the average of pre-season productions. Nor is it belied by the author's own description, which styles the play "a melodramatic comedy." It has the crude outlines of melodrama and not only a happy ending, but a vein of genuine comedy. To the last will be owing whatever success the piece may achieve. For of solid construction or even "go" there is next to nothing. Indeed, it is surprising that a writer who has other plays to his credit should find so much difficulty in getting his machinery started. For the purpose of melodrama he has a sufficient theme. Partners of a flourishing candy business have died, leaving behind them an agreement that their fortunes shall go to the son of one and daughter of the other, provided these two shall marry each other. But the one who first disobeys the injunction by wedding another shall be deprived of any portion of the fortune. Of course, these two independent young people determine to marry whom they please, and a pretty intrigue is presently afoot.

It is in furtherance of this plot that the real comedy of the play appears. Dave Fulton (remarkably well played by Charles Ruggles), spurred on by an accomplice equally down and out, agrees to impersonate Jericho W. Braden, one of the heirs to the estate, who is supposed to have been killed in a railway accident. The combination of daring, and physical and moral timidity demanded by the author is most convincing in the representation of Mr. Ruggles, who throughout the play is an amusing and quaintly appealing figure. For the rest, it is enough to say that the play is no better than the usual productions with which managers attempt at this season to feel out their audiences.

F.

"The Growth of English Drama" (Oxford: the Clarendon Press; 3s. 6d. net), by Arnold Wynne, is a scholarly, comprehensive, and convenient handbook. To students of early English dramatic literature it has, of course, nothing new to offer, but for the casual or less diligent reader, desirous of acquiring intelligent acquaintance with the main outlines of a big subject, without the expenditure of much time or labor, it will prove uncommonly useful. Beginning with a brief sketch of early church drama on the Continent, it furnishes excellent summaries and descriptions of the miracle plays of the twelfth and succeeding centuries in England and of the late moralities and interludes. Here Mr. Wynne traverses old and well-trodden ground, but the critical acumen with which he points out the significance of each development, the copiousness of his well-selected quotations, and his concise analysis of plot give decided value and interest to his volume. He has been at pains to supply just the information which is missing from most short works of this description and which could only be obtained by reference to the original texts, or those standard commentaries which are not at everybody's disposal. Moreover, his individual comments are, as a rule, eminently sagacious, while his style is vigorous and attractive. Nearly one-half of his book is devoted to a consideration of the comedies of Lily, Greene, Peele, and Nash, and the tragedies of Lodge, Kyd, and Marlowe. In his comparative estimates of Lily, Greene, and Peele he is particularly happy, and in discussing Euphuism he displays a pleasing originality in dwelling on the potential graces rather than the obvious absurdities of the school. His remarks on the foundations and principles of dramatic construction are sounder than his application of them. In the light of Shakespeare—whom he does not reach—it is difficult to sympathize with his enthusiasm over some of these early tragedies. In characterization and action they are the crudest of rawhead and bloody bones melodrama. Their occasional literary felicities are another matter altogether. Mr. Wynne wofully exaggerates the value of Kyd's "Spanish Tragedy," even if it did, in some respects, mark a step in dramatic evolution. Marlowe's "Jew of Malta" is, undoubtedly, a work of poetic genius, but Barabas is a grotesque psychological impossibility, whom even Samuel Phelps, with all his declamatory and emotional power, could not galvanize into renewed life. Marlowe was a great poet, who knew how to cater to the theatrical tastes of his time, and he has an imperishable fame in literature, but his disappearance from the stage is, perhaps, sufficient proof of his essential defects as a dramatist. Of the splendor and power of many of his individual scenes there can be no question. Mr. Wynne's book amply fulfils its main purpose and may be heartily commended.

"The Unveiling" (Putnam; $1.25), a poetic drama in five acts, by Jackson Boyd, is an ambitious effort to explain, on scientific principles, the whole order and scheme of the universe from the first living atom to the final consummation, the establishment of ideal man in a kingdom of Heaven upon earth. The inhabitants of this Paradise, however, are to remain subject to the prevailing conditions of mortality. Man, it seems, is to work out his own salvation, by gaining wisdom from experience and acquiring a mastery of all the secrets of nature, which, of course, is not an original idea. The play is supposed to be the dream of a college student. In it Ormazd and Ahriman, the spirits of good and evil, are incarnated, and reveal to him—after he had elected to be a disciple of Ahriman—the consequences of his choice, brief success and final ruin. For acting purposes the play is hopeless, on account of its portentous length, its chaotic construction, the exceeding blankness of its verse, and the confusion of spiritual and material ideas, which the dream figment does not excuse or explain. But it is the work of a clever man, whose ideals are high—if not of the most inspiring kind—and contains some admirable individual scenes, in which theological opportunism and various social hypocrisies are assailed with refreshing vigor. What is a little strange is that the vision of a man of such determined optimism, and faith in the evolutionary forces of nature, should not be able to see further. But he should write in prose and study the art of condensation.

There is some charming work in "Earth Deities and Other Rhythmic Masques," by Bliss Carman and Mary Perry King (Mitchell Kennerley; $1.50). "The Dance Diurnal," in which Night, Day, Shine, and Shadow weave their figures to mark the eternal successions of light and darkness, is full of happy descriptive fancy, and "Earth Deities," in which visions of Vertumnus, Iris, Syrinx, Fauna, Psyche, Beroe, Ceres, Bacchante, Pomona, and Daphne reward the rapt student of Nature, is saturated with the old classic pagan spirit, and expressed with all the verbal felicity, perceptive imagination, and melodic grace characteristic of Mr. Carman's verse. The delicacy of the lines relating to Daphne contrasts admirably with the rattling roll and "frenzied throb" of the Bacchic lines. The "Pas de Trois," for Pierrot, Pierrette, and Columbine, to the accompaniment furnished by an organ man, is a delightful and ingenious jingle. "The Children of the Year" is of altogether inferior quality.

"Radisson, the Voyageur," a verse drama in four acts, by Lily A. Long (Holt; $1), is vastly superior to the majority of pieces of similar description dealing with the adventures, real or imaginary, of far western pioneers. In the first place, it has a fresh and solid historical foundation. The names of Pierre Radisson and his brother-in-law, the Sieur de Grosseillers, were entirely unknown to fame, until the accidental discovery of old manuscripts, thirty years ago, revealed the fact that their explorations, as hunters and trappers, led to the establishment of the Hudson Bay Company. They were among the first white men, in the middle of the seventeenth century, to penetrate the recesses of the great Northwest, and their actual adventures contained all the elements of romance, except a love story. This the author has very wisely and ingeniously woven into the actual records, with excellent effect. In the theatre the drama would be impracticable, for many reasons, but, as she suggests, it might easily —by liberal excisions—be converted into an admirable instrument for interesting and instructive outdoor pageantry. The Indian scenes offer a variety of spectacular opportunities. If the verse is not particularly rich in poetic inspiration, it is smooth, animated, and agreeable, while the tale itself is interesting and the different characters are sketched with spirit and vitality.

Music

MUSIC IN AMERICA.

Early Opera in America. By O. G. Sonneck. New York: G. Schirmer.

Studies in Musical Education: History and Æsthetics. Ninth Series. Hartford: Music Teachers' National Association. $1.60.

Oscar G. Sonneck, Chief of the Division of Music in the Library of Congress. is not one of those historians who compile their books from the tomes of their predecessors. A few years ago he issued a volume on "Early Concert-Life in America," which had involved a prodigious amount of original research in newspaper files and other documents. To this book he has now added as companion an equally scholarly and valuable treatise on early opera in this country. He admits his indebtedness to the three bulky volumes making up George A. Seilhamer's "History of the American Theatre," to which he refers as a work "truly monumental and so astonishingly full of information that merely to extract and copy the musical data would mean to have compiled a fairly exhaustive monograph on our early opera, opera singers, opera houses, and so forth." But the greater part of Mr. Sonneck's history is based on independent research. Much of the material contained in it was written originally for serial publication in the *New Music Review*. At one time the author was so impressed with the inadequacy of what he had been able to gather that he almost cast aside the projected book as "hopeless." Fortunately, this was only a passing mood, for while much remains to be done, chiefly by local chroniclers with unlimited time at their disposal, it is none the less true that Mr. Sonneck's monograph goes far towards reaching his goal of laying bare the roots of opera in America.

He reaches the conclusion—subject to correction by local historians—that the first opera advertised by title for performance on American soil was "Flora, or Hob in the Well," an English ballad opera, which was produced on February 18, 1735, at Charleston, S. C. Charleston was, throughout the eighteenth century, one of the country's chief musical centres, although at the end of the century it had only 20,000 inhabitants. Other centres at that time were New York, with a population of 60,000, Philadelphia (70,000), Boston, and Baltimore (about 25,000 each). One of the most striking results of Mr. Sonneck's investigations is that not only these leading cities, but smaller ones, like Providence (9,000), Salem (8,000), Washington (3,000), and Hartford (3,000), with many others of similar size, came in every year for one or several musical "seasons." The author considers this fact particularly significant, so far as the towns of New England are concerned, "for there, we have been taught, the pleasures of life were not looked upon as necessities, as down South." Another interesting reflection is

that in this early period there was an organization named the Old American Company, which had in its repertory, besides an equal number of tragedies, comedies, and farces, between fifty and sixty musical entertainments; which proves that, together with early concert enterprises, opera, using the word in its most elastic sense, filled our principal cities with music to an extent which cities of similar size do not possess to-day; a remark which, so far as quantity is concerned, applies even to New York. It should be borne in mind, too, that the presence of an opera company in a town resulted in concerts given by their principal singers.

Naturally, some of the details in this book regarding early performances and those who appeared in them make dry reading. Mr. Sonneck atones for this by providing amusing illustrations of the manners and customs of the olden times. There was not, in those days, the modern craze to witness first performances. A Philadelphia correspondent, in reviewing the reopening of the New Theatre, remarks that "as the *beau monde* repudiates the idea of a first-night performance, we were not surprised at meeting but few ladies there." A managerial announcement declared that "the music will be assigned for each evening—it is therefore requested that no particular tunes may be called for by the audience." Provincial orchestras were often made up in part of amateurs, who, we read in the *Pennsylvania Gazette* of November 30, 1769, "as they have no view but to contribute to the entertainment of the Public, certainly claim a Protection from any manner of Insult," such as, to cite another request printed in 1794, "throwing apples, stones, etc., into the orchestra." Such things, to be sure, may happen to-day; and in many ways the olden customs were similar to those of our time, as in the matter of endless encores at the concerts given by operatic singers, the result, in some cases, being that the entertainment was "protracted to so late an hour as to leave the contending songsters to a show of empty benches and a handful of tired-out hearers; the audience preferring to retire at a reasonable hour."

While it is doubtless true that, as pointed out by Mr. Sonneck, the American cities of all sizes had proportionately more musical entertainment, two centuries ago, than they have now, qualitatively the comparison is in our favor. One would, for example, look in vain in the olden days for even a germ of a volume like the Papers and Proceedings of the Music Teachers' National Association, the ninth annual volume of which is now before us. Every paper in this book bears witness, directly or indirectly, to the surprising growth of musical activity not only in public entertainments, but in homes and schools, where teachers are kept busy. It is almost startling, for example, to read, in the chapter headed Report of Public-School Conference, regarding Oakland, Cal., that in that city there are forty-two grade schools in which no fewer than twenty-three bands are organized, and twenty-one orchestras! It is impossible to exaggerate the importance of such a situation for the future of musical appreciation. Under the head of "A New Mission for the Violin," Prof. Paul Stoeving, of the Guildhall School, London, tells about the National Union of School Orchestras in England. Every year a festival is held by this Union at Crystal Palace. In June, 1914, the number of violin players heard together in that building reached the stupendous maximum of 6,800; yet these represent but a small fraction, the London pick at the most, of the actual number of school children who play the violin. In 5,000 schools all over the country, orchestras have been formed, with a total of something like 200,000 violin-playing children—"a movement of gigantic proportions and incalculable possibilities." Professor Stoeving believes that a similar American movement will soon render the English prototype "a mere apology"; and he is pleased with this amazing and steadily growing activity in both countries, at a time when concert-givers so often appear in empty halls. What has been wanting heretofore in England, as well as in America, is "music-making in the home"; and this will be greatly promoted by way of the flourishing condition of music in the schools. From this movement the writer expects much better results than from free concerts, the value of which seems to him problematical.

Among the other interesting papers in this volume may be mentioned an account by J. Lawrence Erb, of the Fifth International Congress at Paris in 1914; "Musical Evolution in Russia," by Jaroslaw de Zielinski; "Musical Education in the British Isles," by Percy A. Scholes; William Howard's "The Voice Teacher's Opportunity in the National Awakening"; "Music in the Pacific Northwest," by Elias Blum; "The Will to Practice," by the President of the Association, Charles H. Farnsworth; "A New Era in Piano Study," by Henry Holden Huss; "High-School Orchestras as a Stimulus to Instrumental Study"; "The Symphonies of Mahler," by P. G. Clapp; and a few pages on the Music Division of the New York Public Library, by Edward Silsky.

HENRY T. FINCK.

Prof. Edward Dickinson, of Oberlin College, is one of the leading musical educators of the time. To his three valuable books: "Music in the History of the Western Church," "The Study of the History of Music," and "The Education of a Music Lover," he has now added a fourth, "Music and the Higher Education" (Scribner; $1.50 net), which cannot be commended too highly, particularly to the professors and college trustees of this country. It is, in the main, a plea for the recognition of music in our institutions as one of the great forces making for true culture, a barrier against "the swelling tide of vulgarity and debasement." The author's profound yet lucid thoughts on the true inwardness and function of music will open the eyes of many college dignitaries who are still skeptical as to its value. His able arguments will be aided by the fortunate circumstance that the tide is turning in their favor. Edward MacDowell seemed to lose his fight for university recognition of the fine arts; but the cause is now winning. Up to a certain point, music has long been welcomed as a precious influence in college life. "The student song is a branch of the folk-song, spontaneous and inevitable. If a college could be found anywhere in the wide earth where singing was unknown, one would infer but dry returns from a mental life so hard and joyless." The religious branch of music has also long been fostered, as an aid to devotion, but secular art-music is only just beginning to get its dues. Professor Dickinson's book not only pleads eloquently for equal recognition of this great branch, but points out in detail what should be done to make it count as a true educational force. The second half of his treatise is concerned principally with the subject of musical appreciation. Emerson remarked that Thoreau had the eye of a bird. His "Journals," says Professor Dickinson, "display an almost incredible acuteness of vision," and his ear for the sounds of nature was equally keen. Ruskin declared that in one of Turner's landscapes there is not a space as large as a grain of wheat that does not contain gradations in color. Thoreau and Ruskin endow their readers with new senses. They taught appreciation of the arts, and teachers of appreciation of the fine arts, including music, are, in Professor Dickinson's opinion, what our colleges need.

Art

"The Art of the Exposition," by Eugen Neuhaus (San Francisco: Paul Elder), is a prettily made book devoted to the architecture, sculpture, and mural painting of the Panama-Pacific Exposition, excluding exhibits of gallery type. There are a number of illustrations. The criticism is generally judicious, but written in a very lumbering English.

"The Studio" Yearbook of Decorative Art for 1915 (Lane; $3 net) lacks perforce the usual articles and illustrations from continental Europe, but includes as recompense a rather fragmentary and desultory chapter on Architecture and Decoration in the United States, by Alfred Yockney. This latter department should be continued and enlarged, with a view to offering a really catholic representation of the best work of American craftsmen. The present selections seem to be confined to a few examples casually picked up in New York, Boston, and Philadelphia. Nothing is shown of the very active production of artistic handicraft in Chicago and elsewhere west of the Alleghanies. The British chapters, profusely illustrated, comprise Small Country Houses and Cottages, by M. Baillie Scott; British Domestic Architecture; Thatching, by Sydney R. Jones, a very fascinating subject; British Decoration, and Wall Paper Designers and Their Work, by Horace Warner. The text, as usual, is informational and much better written, in a literary sense, than that of average articles in our American fine art magazines. The pictures, like those of the 1914 yearbook, seem to prove that domestic architecture in Great Britain is in a very promising state, and that the applied arts are not altogether keeping pace with its development.

"Lost Mosaics and Frescoes of Rome of the Mediæval Period," by C. R. Morey, number IV of "Princeton Monographs in Art and Archæology" (Princeton University Press; $2), is a publication of drawings made for the antiquary Cassiano dal Pozzo, and now at Windsor. These rude colored copies Professor Morey identifies as the work of Antonio Eclissi. They were made early in the seventeenth century at a moment of general demolition and rebuilding. Happily, certain pious antiquaries took the pains to copy these disappearing monuments. Upon such copies, for example, we largely depend for our knowledge of the decorations of St. Paul Outside the Walls and of old St. Peter's. The Windsor copies, though well known as part of the Albani collection, from which they passed to George III only against Winckelmann's protest, have never been so fully published. Professor Morey makes a selection of the more instructive sheets. Some, as is the case in S. Lorenzo in Lucina and the Chapel of St. Nicholas in the Lateran, preserve designs which have been destroyed. Others, as S. Teodoro, SS. Cosme e Damiano, and S. Passera, throw light on the original state of much restored pictures. Virtually all the material presented is of work of the thirteenth century or thereabouts. Thus the study adds considerably to our data for the understanding of the movement that culminated in Pietro Cavallini. The seventeen illustrations, representing eight compositions, are accompanied by an elaborate and learned commentary. From it we may only mention a more convincing reading of the imperfect signature of Cavallini, at Sta. Maria Nuova. The Windsor drawings not seldom offer new epigraphic evidence. We shall await with interest the author's further cultivation of this field.

Finance

THE ARABIC AND THE MARKET.

It was natural that the news, last Thursday afternoon, of the destruction of the Arabic by a German submarine, with loss of American lives, should have instantly affected the Stock Exchange. Wall Street recalled the break of 10 to 30 points, in stocks which had previously been a focus of speculation, when the news of the Lusitania arrived on the 7th of May. Prices for these very stocks had gone still higher, during the intervening time. The outside public's speculative activities in them had extended widely. If fear of a breach with Germany had been the primary cause of the demoralized market of three months ago, that danger was unquestionably very much nearer now.

In the three or four days after the news from the Arabic, there occurred in fact a sufficiently violent decline. Prices of half a dozen of the most active speculative shares fell 9 to 18 points from the prices quoted just before the news came in. When this week's market opened, it was felt that the real test of the financial situation, in its relation to this latest German outrage, was at hand. The course of events on the Stock Exchange was peculiar, and perhaps significant.

The story of the market was of a violent break, with the sales coming largely from good financial quarters, followed by an even more violent recovery, in which the previous declines in prices were for the most part cancelled, and in which the outside public was a heavy buyer—wholly in connection with rumors as to the Arabic and the controversy with Germany. On Tuesday afternoon, at the top of an unimpeded upward reaction of more than one full day, came the news of Count Bernstorff's communication to the State Department, which on Wall Street, was interpreted as disavowing, in behalf of the German Government, the action of the German submarine.

A very remarkable incident in itself, this move of the Berlin Foreign Office was hardly less remarkable for the manner in which the Stock Exchange foreshadowed it. Apparently, it was an instance either of the prescience with which the stock market always measures the probabilities of an important situation, or, what sometimes amounts to the same thing, of the channels of private information possessed by the higher circles of finance, which find heir expression ultimately on the Stock Exchange. Yet, behind all this probable influence of secret knowledge in advance, the interesting fact of the present market has been the persistency on the part of the general "outside public," in the belief that even war with Germany could not arrest the revival of American prosperity.

Was this belief well-grounded, or not? Declaration of war with Germany would not necessarily have interfered with some of the elements in our present financial and industrial prestige. As matters stand in the European war, this country could not be invaded. Our land forces could not come into actual contact with those of Germany. Our trade with all nations outside the Triple Alliance would continue; those nations would still buy our agricultural and manufactured products, and the breaking-off of diplomatic relations with Germany would not sever our trade with her any more completely than it is severed already by the English blockade of the German coast.

In the more conservative circles of finance, the visible evidence of this country's powerful economic situation is as yet the bulwark against despondency and misgiving over the German controversy. With the public at large, the enormous orders for war munitions, causing activity in our factories and swelling our outward trade, is the main consideration. It is yet to be determined, how far the first ground of reassurance would persist if the dispute with Germany were to reach a state of war. Nor is it yet entirely clear to what extent even the "munitions exports" would be affected in such case. The speculative public's equanimity might be seriously upset, even by the calling of Congress in extra session; for a hot debate on our English and German relations, and effort to bring about an embargo on munitions exports would then inevitably ensue.

Common Sense Applied to Woman's Suffrage

By Dr. Mary Putnam Jacobi

New Edition with an Introduction by Frances Maule Björkman.

12°. $1.00 *net.*

The extension of an address delivered by its author before the New York State Constitutional Convention of 1894. The address was described at the time by friends and opponents of Equal Suffrage as the most weighty, dignified, and forcible statement that had as yet been presented in behalf of the removal of sex restriction on suffrage. The author's statements and reasonings are as pertinent to-day as they were twenty years ago.

A VOICE FROM THE CROWD

By George Wharton Pepper, LL.D.

The sincerity and earnest purpose of Mr. Pepper's lectures may perhaps best be expressed in his own words when he says: "Preaching is the public use of speech with intent to reveal God to man. While its aim is the revelation of God, yet one of its incidents is the unconscious self-revelation of the preacher. The function of a voice from the crowd is to offer practical suggestions to the man in the pulpit as to the way in which he may attain godliness and may enrich his humanity."

J. B. LIPPINCOTT COMPANY

The Manassas Industrial School OF Manassas, Virginia

A LITTLE school on the battle field of Bull Run founded by a colored woman some twenty years ago. It is doing invaluable work among the young colored people of Northern Virginia in giving them skilled training in many trades, and fitting them for intelligent citizenship.

The school has the endorsement of the Miner Board, the Slater Fund, the General Education Board and the Phelps-Stokes Fund, and its influence on the community life in that section is marked. It is largely supported by annual contributions, but its income from this source is insufficient. Your help to increase this income will be appreciated.

Contributions, large or small, are gratefully received, and may be sent to

A TEXT BOOK OF THE WAR

FOR AMERICANS

By J. Wm. White, M.D., Ph.D., LL.D.

"It is undoubtedly the most effective compilation of facts, quotations, and citations yet contributed to the vast literature on this subject. As an effective argument, it is a cross between the 42-centimeter cannon and the French 75—tremendously destructive like the former, and smooth in action like the latter."
—*Ex-Attorney-General James M. Beck.*

A New Book on Food and Digestion

This is the most original and most important book I have ever written. J. H. KELLOGG.

So many people suffer from indigestion and other more serious ills it leads to, that Dr. Kellogg has written a book, telling the causes and effects and how to avoid them. Dr. Kellogg is the world's greatest authority on matters of diet. He is a specialist on foods and digestions. The great Battle Creek Sanitarium, of which he has been Superintendent for nearly forty years, is the leading diet institution of the world. Dr. Kellogg, therefore, writes from the standpoint of knowledge gained by experience. What he tells is the result of actual practice. Yet—he writes so plainly anyone may understand. You may easily follow Dr. Kellogg's teachings in your own home. Send for his new book "Colon Hygiene." Nearly 400 pages. Many illustrations. Diet tables and instructions for exercise, rest and sleep. Cloth binding $2. Library paper $1. Send your order today. You take no risk. If not satisfied, return the book for prompt refund. Send order to—

NEW YORK, THURSDAY, SEPTEMBER 2, 1915.

Summary of the News

The crisis of America's issue with Germany over the sinking of the Arabic was passed on Tuesday of last week, when Ambassador Bernstorff forwarded to Washington expressions of sympathy sent by the German Government, together with the request that the American Government wait for further particulars before taking a definite stand. On August 25 Chancellor von Bethmann-Hollweg gave out a statement to a representative of the Associated Press in which he said that, if the commander of the submarine which sank the Arabic had exceeded his instructions, "the Imperial Government would not hesitate to give such complete satisfaction to the United States as would conform to the friendly relations existing between both Governments." The inference is that some time since the sinking of the Lusitania orders were issued forbidding the torpedoing of passenger ships without warning. On Thursday of last week the German Ambassador called at the State Department and, it is understood, gave assurances that the whole dispute over submarine warfare, so far as it concerns this country, would be brought to a peaceful settlement.

Nothing definite is known by the public as to the lines on which the German case will be presented. But it is reasonably certain that the President will insist upon a discussion of the question on its own merits, regardless of what the United States Government may have in mind in the way of attempting to modify the English blockade of German ports. Meanwhile the situation may be somewhat affected by the fear expressed in Berlin on Tuesday that the submarine which is alleged to have sunk the Arabic has been lost.

Informal negotiations by foreign trade advisers of the State Department have resulted in concessions also from England. The British Ambassador, Sir Cecil Spring-Rice, has explained that the concessions are especially designed to relieve the hardship of American importers who have contracted for goods made in Germany and Austria for the Christmas trade. The proposed relaxation of the Order in Council of March 15 will, it is understood, release American-owned goods of German origin now at Rotterdam and valued at more than $150,000,000.

On Thursday of last week Col. Roosevelt's name was once more to be found on the first pages of the morning papers, as a result of his attack made the preceding day upon President Wilson. On the invitation of Major-Gen. Wood Col. Roosevelt addressed the business men in training at Plattsburgh and instructed them mainly as to the meaning of the phrase, "standing by the President," his interpretation being that the President should receive the adherence of American citizens only when he was right, and he plainly implied that Mr. Wilson in his foreign policy had substituted "elocution" for "action." This speech brought a rebuke from Secretary of War Garrison to Major-Gen. Wood for allowing Mr. Roosevelt such latitude. Thereupon the Colonel shifted his attack to Mr. Garrison, upbraiding him for not having asked to see the now notorious speech in advance. Mr. Garrison countered neatly by remarking good-humoredly that he was too busy a man to hope to save the Colonel from his indiscretions. And there the matter rests.

Following up its designation of cotton as a contraband of war, the British Government has announced through the Embassy at Washington that assignments of cotton would be permitted to neutral countries to the extent of their normal consumption, but that "under the procedure of international law relating to absolute contraband, evidence of ultimate destination will be necessary to the condemnation of cotton as lawful prize."

The Austro-German armies have added considerably to their successes recorded in our issue of last week. It was announced last Thursday that the fortress of Brest-Litovsk had been captured, and later that the Russian lines in southeastern Galicia had been pierced at two points. If this latter statement is true, operations of the railway leading to Kiev may be seriously interfered with. In the Baltic provinces Gen. Hindenburg's forces have resumed the offensive. Grodno is holding out. According to reports, von Hindenburg still has hopes of cutting off the Russian retreat by capturing a portion of the great Warsaw-Petrograd railway north of Vilna. We leave our readers to fill in the details of the Austro-German operations from the extended discussion of the matter found in our editorial columns.

What is understood to be an inspired statement of Bulgaria's present attitude has appeared in a publication controlled by the Government of that country. It explains that it is the intention of the Cabinet to adhere to a policy of neutrality except in the event that the rights "filched from Bulgaria" under the Treaty of Bucharest after the second Balkan War are restored. Berlin, on the other hand, continues to believe that a Bulgarian-Turkish agreement has been signed and is about to go into effect. As for the concession asked of Servians to facilitate the entrance of Bulgaria into the war on the side of the Allies, dispatches from Nish and Rome, transmitted by London, give the positive assurance that Servia's reply to the Powers of the Entente has been received, and that it makes the "indispensable sacrifice." Until more definite proof is furnished, cautious observers of the situation in the Balkans will not look for action.

Malcontents who have recently been busy with a plan to embarrass the French Government in its conduct of the war, and especially to retire Gen. Joffre, were put to rout in a session of the Chamber of Deputies on August 26. Though intending to strike at the Cabinet, and particularly at M. Millerand, Minister of War, because of the secrecy in which Government business has been enveloped, such a feeling against them developed in the Chamber that, instead of recording their dissent from the Government, as expected, they voted the war credits asked almost to a man, the figures being 539 to 1.

Considerable activity has been shown during the past week by French aviators, who have bombarded at Dornach a plant where the Germans manufactured asphyxiating gases and also the railway station at Mülheim, in the Grand Duchy of Baden, besides repulsing an attack upon Paris attempted by six German aviators.

After a period of unusual success, the German submarines have during the past week relaxed their activity. Since we last wrote they have sunk two British merchantmen, two trawlers, and the Swedish steamship Disa. Lloyd's quarterly report for the period ended August 12 gives the losses to British shipping from submarines and other hostile craft and from mines as 68 steamships, with an aggregate gross tonnage of 180,713, and nine sailing vessels.

Hayti's Parliament has been given until the 17th of this month to act on the treaty urged by this country, according to which the American Government proposes to establish a protectorate for ten years over the island republic. Secretary Lansing on August 25 gave out a most important statement concerning American intentions. The purpose is to protect Hayti, by assuming control of her finances, against the machinations of grafting politicians. Mr. Lansing was emphatic in declaring that the Administration would be bound by its pledges to refrain from acquiring a foot of foreign territory. But he implied that if the Haytians would not accept the treaty offered, this Government was prepared to exercise force.

The American submarine F-4, which was wrecked in Honolulu harbor on March 25, with the loss of twenty-two lives, has at length been raised from a depth of 300 feet, and has been placed in dry-dock. Thus far only one of the bodies has been identified.

A report was current on Wednesday that Gen. Pascual Orozco, one of the supporters of Huerta, had been shot and killed in a fight between Mexicans and an American posse.

Agents of the Secret Service of the Department of Justice arrested at Washington last week Gustav Kopsch, a German reservist, on the charge of espionage. Kopsch had in his possession photographs and films of the fortifications at Fortress Monroe and pictures of the proposed fortifications at Cape Henry.

The receipts from tolls of the Panama Canal for its first year of commercial operation, ending August 15, were $5,216,149. This amount represents the passage of 1,317 ocean-going vessels, having a gross tonnage of 6,494,673, and a net tonnage of 4,596,644. The Suez Canal, during the past year, has received from tolls four and five-eighths times the amount taken in at Panama.

The Week

Hopefulness in Washington regarding the prospect of a settlement of our submarine controversy with Germany is fully justified. Berlin is indulging in a rapid series of manifestations of a desire to give satisfaction that are positively bewildering when contrasted with the iron attitude of non-concession that her press and her public men have hitherto maintained. First came the Bernstorff note, asking for suspension of judgment until Germany's side of the Arabic case had been heard. Then came Bethmann-Hollweg's interview. Now comes Bernstorff's explicit promise that his Government is prepared to give "full satisfaction." And all this volunteered from Berlin! From the Bernstorff note asking for a little patience on our part it is evident that the German Government had made up its mind to be friends. We were asked to wait until the other side had been heard. What could that other side be? Surely, not the renewal of the general question of Germany's right to sink passenger ships with Americans on board. On that, the note of President Wilson had taken so explicit a stand that there was no further room for debate. Evidently, listening to the other side meant giving Germany a chance to show, not that the sinking of the Arabic was perhaps justified, but that the act was contrary to Germany's orders. Of this we now have specific confirmation.

The reasons for the sudden change of front in Berlin are plentiful. In the first place, undoubtedly, is the desire not to make of us an enemy. The argument so often heard that Germany would not be averse to having us go to war, in order to cut off our supply of ammunitions to the Allies, or in order to make it easier for the German Government to acknowledge a general defeat by pointing to a world of enemies, was always metaphysical. Unquestionably, the victories in Poland have placed the German Government in a position where it can yield without seeming to do so under the fear of defeat. Add to this the growing recognition of the fact that the submarine campaign against England has cost more than it was worth. The British Admiralty's phrasing of the report regarding the destruction of a German submarine by an aeroplane goes to confirm the belief which has been current for many weeks that Germany's loss in undersea boats has been far heavier than she has admitted. Finally, comes the diplomatic reason. Having yielded to us on a matter which for half a year Germany has professed to consider of vital concern to her, she can now begin to press for action by our Government against England in the matter of blockade. The coincidence in time between the establishment of cotton contraband and Germany's giving in on submarine warfare may be significant.

Germany's yielding to the United States has surprised and impressed English newspapers. They speak of it as a great American diplomatic triumph, and call it a "fine moral victory for President Wilson." If such a thing had happened after our fleet had been mobilized, or plans announced for raising an army of 3,000,000 men, we know how jubilant our super-militarists would have been. As it is, they have been telling us that the country is so weak and contemptible that nobody pays any attention to our protests, and that our honor is trampled into the dust by every nation that chooses to do it. Well, what they have to explain now is the fact that the mightiest military Power on earth has eagerly sought to keep the friendship of the despised United States, and to do what we have demanded as a matter of law and neutral rights. This is the sudden and amazing change in German policy which has overcome the whole world with special wonder. Of course, much remains to be done. The settlement of the Arabic case, which the German Government now promises to our full satisfaction, has to be made the basis for the settlement of the entire large question at issue. From the one instance our Government will be able to advance to the general principle. This is that Germany wholly concede our contention as to past events, and give us assurances that nothing of the kind will occur in the future.

Not everybody in Germany is in agreement with Minister of Finance Helfferich in regarding the enormous war expenditures as an investment on which the returns will come from indemnities contributed by the Allies. The Berlin *Vorwärts* points out that after the war the interest on the Imperial debt and pensions alone will amount to two and a half billion marks ($625,000,000), which is only one hundred million dollars less than the total expenditures of the Imperial budget three years ago. In discussing the possible effect on internal conditions of the enormous problems in taxation which the future will bring, the *Vorwärts* plainly does not take it for granted that the Allies will pay the interest on Germany's debt, or that money will be obtained, as suggested in some quarters, by selling back the soil conquered by the German armies to its former possessors. Germany's vast outlays did not begin with the outbreak of the war. Shortly before that came the patriotic "war contribution" of a quarter of a billion dollars. Whereas the "extraordinary" expenditures in the Imperial budget during the years 1912-14 ranged between twenty-five and thirty million dollars, in 1915 they ran above $2,500,000,000. Of course, the financial problems that confront Germany must be faced by all the Allies in varying degree; and the result everywhere is bound to be what the *Vorwärts* foresees for Germany—a demand for a great extension of popular rights, as a reward for the sacrifices of the war and the vast new burdens imposed upon the people.

The arrival on Sunday of $19,500,000 from Europe, in part payment of the increasing indebtedness on the part of England and France to the United States for current trade, is in many ways a striking incident of the day. This particular consignment, though sent immediately from England, was not taken from the London market. It undoubtedly is part of the amount of gold (described in the dispatches as $40,000,000) which was shipped a week or more ago by the Bank of France to England. Such a shipment by the French Bank was made easy by the extraordinary manner in which the French people have responded to the request of their Government that they bring their hoarded gold to the Bank to exchange for notes. Since that request was published, on July 2, no less an amount than $107,000,000 gold has been added to the Bank's reserve, that great sum representing part of the hoards laid aside in safe corners, ever since the "Morocco episode" of 1911 foreshadowed the coming war. As for the indebtedness of the Allied belligerents to the United States, that is something which grows more spectacular as the war continues. In the popular mind, this excess of payments due to us from Europe, over payments due to Europe from us, is commonly ascribed to the enormous orders placed here for war material. Those shipments have undoubtedly played their part; including exports such as horses and woollen and rubber goods, which must be largely destined for military uses, we have sent out since August, 1914, perhaps $170,000,000 more than in the same months of the preceding twelvemonth. But the Government's report of our foreign commerce for July, just published, shows

that as yet the "munitions exports" are but a relatively small part of our increase in outward trade. In the seven completed months of 1915, our total export of merchandise ran $769,000,000 above that of 1914, while the surplus of exports over imports was larger by $900,000,000.

The Vatican has probably received with only partial gratification the suggestion of an improvement in the status of the Papacy, put forward in the course of the recent debate in the Reichstag. "The position created for the Pope by the war," said Dr. Spahn, leader of the powerful Catholic Centre, "reveals its untenability for the future and compels us to think of the international regulation of his status which shall be commensurate with the rights, dignity, and duties of the Papacy." This is plainly directed against Italy, the new enemy, as Bethmann-Hollweg called her in the same debate. Outside interference will be regarded in Italy as making only more difficult the relations between Quirinal and Vatican. Nor does it improve the international status of the Papacy to make its interests a war issue. The position of the head of the Church has been hard enough in a war in which Catholics are engaged in slaughtering each other, and in which the Princes of the Church have assumed the rôle of partisans. Cardinal Mercier's hot protest against the ills inflicted by the Germans upon Belgium must be reconciled somehow with the action of the Cardinal-Archbishop of Cologne in congratulating the Kaiser upon the triumph of German arms. The Catholic Committee of French Propaganda, under the patronage of the Cardinal-Archbishops of Paris and Rheims, has been circulating documents and photographs accusing the German armies of sacrilege as well as cruelty. The Church is suffering sufficiently from the strife of national passions without having the issue of the political status of the Papacy superadded.

It was as a result in part of our own Civil War, in part of Europe's development of iron hulls, that the American merchant marine rapidly began to lose place about 1863. As a consequence of the European war and the lower price of steel plates in America, it has now mustered a greater number of ships than at any time since that year. The American flag can to-day be seen on 2,768 vessels registered in the foreign trade; and whereas in 1913 the ports of Great Britain were visited by fewer American ships than even Greek, Russian, or Spanish, we now have a tonnage running close to that of France and Norway, or fifth in the world. It is not likely that there will be many more foreign vessels transferred to American registry, but our own shipyards are turning out an ever-increasing number. There was a time, when sailing navigation reached its greatest development early in the last century, that the American navy stood first on the Atlantic, and was seriously trying to wrest the Chinese trade from England. Frenssen's hero of that day, standing on the Hamburg waterfront and trying to catch the flags of the largest vessels in sight, could remark: "Of course—the Star-Spangled Banner." The new and unprecedented increase in tonnage is a reminder to us that we achieved our old station by building ships of superior speed, carrying capacity, and labor-saving devices. To gain or hold our own after the war will challenge our builders, while it already puts upon our legislators the necessity of repealing laws that increase labor-costs.

The Commons-Harriman portion of the report of the Industrial Relations Commission will receive discussion where Walsh's maunderings will be thrown aside. The plan is to create a permanent bureau in each State, and another at Washington, the former to administer and enforce all State labor laws, the other Federal laws. Associated with each should be an advisory council, representing capital, agriculture, and labor, and serving without pay. The whole idea is to entrust to an impartial body, coöperating with all parties, matters that are now fought out blindly in Legislatures and in manufacturing plants. It is easy to adduce reasons why practical applications of the plan will be slow. There is by no means unanimous agreement that the greatest cause of industrial unrest is the breakdown in the administration of the labor laws. The serious split in the Industrial Relations Commission itself breeds a doubt whether the permanent State and Federal commissions and their councils would be such harmonious bodies as Professor Commons envisages. With the members intrenched behind their six-year terms, deadlocks and quarrels might be endless. The report gains nothing by its inclusion of an inadequately sketched plan for an inheritance tax to support these new industrial bodies. It would be felt, too, that our State Executives could not always be entrusted with the appointment of a body of such far-reaching powers. Moreover, legislative interference is sometimes salutary. But the Commons plan may still be adjudged to stand out from the general wreckage of the Industrial Commission's findings, and it might be well if it induced some States to enter upon the experiment it recommends.

Cotton is holding his sceptre more steadily than he was able to do at one time. He has been immensely cheered by the announcement of Southern banks of importance that they will lend money on cotton at the rate of six or seven cents a pound, and an interest charge of only 6 per cent. a year. This announcement is made possible by the Federal reserve system. The Federal reserve banks were the first to express their intention of financing the crop, and the conditions they laid down were few and simple. They will require safe storage, a satisfactory warehouse receipt, and adequate insurance. Upon these conditions, they will advance, through their member banks, 75 per cent. of the market value of the cotton offered as collateral. Secretary McAdoo's announcement that he will place $30,000,000 in gold in the banks of the cotton belt without interest, to be used in making cotton loans, makes it possible for the reserve banks to lend through their member banks at the lowest interest rate. The result must be at once financial and psychological. Financially, as the Atlanta *Constitution* notes, the grower will be able to meet his obligations, to "take care of himself," and to hold his cotton until market conditions warrant his disposing of it. The psychological gain will be in his perception that sound financial methods avail more than spectacular ones.

A bulletin of the Federal Bureau of Labor Statistics on the effects of Oregon's Minimum Wage law presents a roseate view. "The average weekly earnings of all women in the six department, dry-goods, and ten-cent stores [in Portland] increased 10 per cent., or from $7.89 to $8.68 per week." At the same time the number receiving $9.25 per week increased 130 per cent. The slight displacement of women by men does not seem chargeable to the new rulings. The question arises whether causes were not at work which would have independently caused a rise in the weekly wages of women, and whether the six stores examined are typical of employment for women. The Bureau thinks that the financial depression of 1914, with the legislation restricting hours of labor, would naturally have tended to depress wages. It also explains that the six stores were the largest available for study. It is plain

that we need reports from other fields of industry. They should not omit the effect of increased labor-cost upon selling prices.

Ex-Gov. Blease's new freedom carries us back to the state of nature in a way to make cave men gasp. It is refreshing to see how his statement that, "when mobs are no longer possible, liberty will be dead" was rebuked at the Boston conference by Southern executives. His palpable inconsistencies were nicely punctured when Gov. Goldsborough, of Maryland, rejoined that if capital punishment was wrong, capital punishment at the hands of savage lynchers was infinitely its worst form. The amazing thing is to find Blease, as a man who thinks there is no such thing as liberty within the social system and political organism, resorting not to the arguments of raw Rousseauism, but to the stock justifications of the mob against order. The courts, we hear again, cannot be relied upon to do justice; and the "unmentionable crime" deserves a more signal punishment than mere civil hanging. If there were no Southern lynchings that killed innocent men and women, or that often cheated justice within a few days of the time set for an execution, we might have less conviction that they are not merely extra-legal, but anti-legal. If it were not that less than one-third the lynchings are for the grossest of crimes, and that a full third are for minor offences or no offences at all, the latter of his excuses would be more acceptable.

The kind of "preparedness" which consists in choosing for the administration of our military and naval affairs men like John D. Long, who died Saturday, will never meet anything but the warmest commendation. In his work on "The New American Navy" the ex-Secretary describes how, with the development of the war cloud in 1898, he brought the naval service in a few months from its unready condition to comparative efficiency; and his statement that "all the money disbursed by the Department was honestly spent and every purchase made in good faith" was hardly questioned. His record would have been notable even had it not stood in refreshing contrast to the work of the War Department. Apart from his Cabinet term, which closed in a controversy over which he had no control, and which no one regretted more than he, his service in many offices marked him the rare type of the gentleman and scholar in politics. The same year—1879—which witnessed his election as Governor of Massachusetts saw his publication of a translation of the Æneid; and it is still remembered that he found fault with the message dispatching Dewey to Manila for saying that war had "commenced" rather than "begun."

In several matters the New York Constitutional Convention has temporarily "got away" from its natural leaders, only to reverse itself later. This was happily the case with the proposed amendment—first adopted, but later defeated—to make ability to read English a qualification for voting. One obvious weakness of it lay in discrimination against literacy in other languages than our own. Ability to speak English is quite different from ability to read and write it. The Federal Government's naturalization regulations regard the former, with the ability to write one's own name, as enough. Large numbers of voters might muster enough oral English to pass the naturalization examinations, and yet be far from having a literary use of the language. If it was literacy that was alone at issue, the amendments might—as in other States—have required merely a general test. If it was the wish of its sponsors to strike at manifestations of disloyalty among the foreign-born, more direct methods would have been fairer and would have avoided depriving many loyal and enlightened men of the ballot, while giving it to most of the fomenters of discord. Several States require a general literacy test, but apparently only one requires literacy in English. The country's experience with such nativistic restrictions has proved them undesirable.

The action of the United States District Attorney in dropping his inquiry into election frauds in Vermilion and Edgar Counties, Illinois, has been approved at Washington. It seems the laws of Illinois are more effective for such cases than are the Federal laws. This is also true in Indiana. But, while the Indiana officials have obtained the conviction of the Mayor of Terre Haute and the indictment of more than a hundred others, including Taggart and the Mayor and the Chief of Police of Indianapolis, the prosecuting machinery in ex-Speaker Cannon's county and its neighbor is doing nothing in the way of emulating this success. The Chicago *Daily News* makes the sarcastic suggestion that this inactivity is owing to a desire not to bring embarrassment upon "eminent and influential citizens," but expresses its preference for the Indiana method of proceeding, which pays more regard to the embarrassment of the community than to that of individuals, however eminent.

Whoever introduced modesty into politics would be overjoyed at the example of it in Massachusetts. Ex-Gov. Foss confesses that he had foreseen that if he ran for the nomination again he would be charged with caring more for his own success than for that of prohibition. But he explains that he was forced into the fight. Mr. Bird would not be persuaded to "take" the honor, and Mr. McCall refused to declare for prohibition. Even so, Mr. Foss's modesty restrained him from doing anything hastily. But the immodest Mr. Weeks, "having completed his journey across the United States as the self-appointed 'favorite son' of Massachusetts, upon his return home ordered the Republican party of Massachusetts to declare against national prohibition." The most retiring diffidence could not endure this. To be himself effaced was no sacrifice, but when "even the strictest machine-man would soon see that the Republican party in Massachusetts needs me more than I need it," hesitation would have been treason. Foss has "salvaged from the wreck the party's only hope for victory." The sole remaining detail is to make the party see it.

The practical outline which Chancellor Jordan has been giving of the requirements of a college president chiefly defines what he must not be, and will delight those who have a cynical conception of his office. Three centuries ago Thomas Fuller discovered the foremost defects of the schoolmaster in his tendency to be a master to the children and a slave to their parents, and in his scorning to touch the school but by the proxy of the ushers. Chancellor Jordan hints at the president's respect for his peers in saying that he must not tell all that he knows about those around him. As for actual contact with the college, "he must not do anything he can hire some one else to do." Happily, these requirements permit of such broad interpretations that they do not carry the condemnation of Fuller's picture. And the practicality that is the essence of Dr. Jordan's definition is not marred when he says that a president must be a scholar to the extent of knowing truth from untruth. Every State university head extorting his millions from a Legislature, every head of an endowed college organizing his schools and courses up to the public demand of the moment, knows that this does not necessarily refer to philology and science. It may have reference to the pragmatic field where hypotheses are useful because they are true, and truth is what is useful.

A GAMBLE ON INDEMNITIES.

A few days ago, I met G——, the American, just back from Berlin. He is a good friend of ours, and he understands his Germany pretty well. His view was quite simple. "Stick to it, keep your teeth in, and don't worry. You have only to make Germany pay her own costs and you will win this war. The German people will settle with their Hohenzollerns and Bethmann-Hollwegs and von Bülows." G—— means that the whole thing is now a gamble on indemnities, and that if they fail, as they will, there will be a wholesale crash in Germany.

The above is from an article in the *Westminster Gazette*, over the signature "S"—undoubtedly the editor, Mr. Spender. We print it only for what it is worth. The main fact involved, however, is beyond question. Germany is counting upon a huge war indemnity partially to make good her immense financial losses.

On this point there was a remarkably plain-spoken utterance some days ago in the *Frankfurter Zeitung*. It did not attempt to conceal the severe industrial and commercial dislocation which the war had brought upon Germany. And the strain upon the Empire's finances it admitted to be very great. England's financial plight it believed to be worse, and that of France and Russia about as bad; but it argued that neither of those nations could cherish the hope which Germany has of helping to right matters by means of an indemnity. This idea has evidently been sedulously put about in Germany. "We are compelled to make heavy financial sacrifices, but keep on bravely: our enemies will have to pay a good part of the bill."

The matter recently received an official status from the German Minister of Finance. In his address to the Reichstag, at the time of calling for a new war loan of $2,500,000,000—making a total war expenditure of $7,500,000,000—Herr Helfferich spoke of the "gigantic burden of war" which had been laid upon the Empire. But he declared that Germany's "economic future" would be freed from this burden, since "the thousands of millions will be borne through decades by the instigators of the war, and not by us." Whatever view we may take of this, it is clearly put forward as a Government programme. The design may be to brace the German people to further sacrifices by holding out hopes that the authorities themselves know cannot be realized; but, in any case, there the thing stands. The cost of the war is frightful, but we shall make the Allies pay it all.

That there are those in Germany who regard this as illusory is made evident by the fact that financial writers are being called upon to show that the Government is not dreaming. One of these, Herr Bernhard, addresses himself in the *Vossische Zeitung* to the "pessimists" who doubt that the Allies can be made to pay the war-bills of Germany, Austria, and Turkey. He maintains that the plan of Minister Helfferich is not so absurd as it sounds. For Germany holds large strips of conquered territory, both East and West. If these lands are returned to their former owners, "they must pay the price fixed by the victors." If they are retained, they will increase the national wealth and the "actual amount of tax receipts." This is a pretty picture—laying heavy taxes on prostrate Belgium and ravaged Poland! And we see at once how the two ideas of annexation and indemnity come into collision. Both have been dangled before the German people. But now it appears that they must give up one or the other. It might be a sop to the annexationists if the Empire could be paid seven or eight billions not to annex. Yet any such sum, sensible people in Germany must know, could never be exacted from the Allies until they had been absolutely crushed. But if nations have fought to their last man and their last dollar, where are they going to find the billions of indemnity-money wherewith to purchase the right to drag out a contemptible existence?

All this talk of indemnity is purely speculative as yet. If the German Government and the German people are going ahead upon the strength of it, then they are truly acting in the spirit of gamblers. The basis of fact for any solid hope of the kind which the Finance Minister expressed, cannot at present be found. What may appear later, no cautious man will predict; but at present no cautious man will pretend that there is any certainty at all that Germany will be able to exact any indemnity at all. Discussion of it is only part of the continued cropping out of hints and rumors of peace in Germany. Nowhere else are they heard. It is triumphant Germany who alone appears anxious for peace. The significance of this is not lost upon the rest of the world. The stories of an impending financial crash in Germany, with warnings of national bankruptcy, are no doubt put in sensational garb on their way through Amsterdam. But that there is enormous pressure upon the Government to find a way to end the war satisfactorily, there can be no manner of doubt. A part of the apprehension grows out of the heightening strain upon the national finances. Hence the prediction of a war indemnity, to make all good. But this, we repeat, is a sheer gamble.

THE CONQUEST OF POLAND.

Brest-Litovsk is Brest in Lithuania. The fortress was part of the system of the Polish defences, but it lies across the River Bug in Russian, as distinguished from Polish, territory. Except for isolated positions on the Niemen and west of the river, like Grodno, all of the nine provinces of Poland are in the hands of the enemy. In addition, the greater part of the provinces of Courland and Kovno have been overrun, and the Austro-German armies are now pressing forward into the provinces of Volhynia and Grodno. Only along a narrow slip of Galicia east of the Zlota Lipa River do Russian armies stand on foreign soil, and their retirement in this quarter is apparently a matter of days. In just four months the Russian armies have been driven from the crests of the Carpathians and the East Prussian frontier close to the borders of old Russia, before the second partition of Poland in 1793. This has been accomplished in a campaign which, for sweep of operations, the armies engaged, and the sustained energy of the offensive, has no parallel in military history.

The middle of last April witnessed the climax of the Russian effort. In Poland proper at that time there had been a virtual deadlock for nearly two months. The battle-line ran close to the Prussian frontier in the Niemen region, swung further into Polish territory north of the Vistula, crossed that river at the confluence of the Bzura, followed that stream, the Rawka, the Pilica, the Nida, and the Dunajec, in a straight line down to the Carpathians. Here the deadlock ceased. In the mountains the fighting was continuous during the early spring. The northern passes were mastered by the Russians, who penetrated, at one point, twenty miles into Hungary. The centre of the fighting was around Uzsok Pass. With that in Russian hands, the invasion of Hungary on a broad front could be accomplished. Around Uzsok, therefore, the Austrian forces with the German armies sent to their aid, made their great defence, and in the third week of April Vienna was reporting that the Russian attack had been broken.

The Austro-Germans passed immediately to the offensive, but not at the expected point around Uzsok. Instead they hit out along what may be considered the centre of the entire line from the Baltic to the Pruth, namely, on the Dunajec front to the east of

Cracow. The attack began with an annihilating bombardment of the Russian positions around Tarnow and Gorlice in the last two days of April. It was a demonstration on an enormous scale of the new tactics of artillery concentration which the British had practiced at Neuve Chapelle. There followed, on May 1, the assault in "phalanx," which was to show that trench warfare had not reduced military operations to deadlock. The Russian line was broken, the Czar's Carpathian armies were taken in flank and rear, with a huge harvest of prisoners, and there began that great retreat which has not yet come to an end. The extraordinary German talent for system has never appeared to better advantage than in the perfect synchronization of the advance of so many great armies on so huge a front.

The routes traversed by the three main divisions of the Teutonic forces referred to in the Berlin dispatches as "army groups" may be briefly described. The southern or von Mackensen group, now comprising all of the Austrians and the Germans under von Linsingen, have advanced in the course of four months a distance of about 220 miles as measured straight across the map, from the Dunajec and the Carpathians to beyond the Bug. They marched east through Galicia to the San, and pivoted north on the left wing until Lemberg was retaken on June 22. Then the advance was almost due north by way of Lublin towards Brest-Litovsk. It has been the slowest group of the three, its average daily progress being less than two miles. This was due to the fact that they had opposed to them the best of the Russian armies, while on the other hand their own efficiency was probably reduced from the average German level by the presence of the Austrians. Temporary setbacks, such as von Mackensen's armies encountered at the Dniester and around Lublin, were not experienced by the purely German armies to the north.

The German attack from the north by the von Hindenburg group did not begin till late in June, although subsidiary operations against Libau and Courland began early in May. Von Hindenburg's armies have covered the least ground of all. From around Przasnysz, which they captured July 15, to the Warsaw-Petrograd Railway, which they have just crossed, they have advanced some eighty miles, only a little faster than von Mackensen's forces. Von Hindenburg, in turn, had to deal with the chain of great fortresses along the line of the Niemen, the Bobr, and the Narew, from Kovno to Novogeorgievsk. Had he waited for the reduction of the forts in order to advance on a uniform front, his progress would have been much smaller. Instead he threw forward separate armies in the interstices between the Russian strongholds. So to-day the German front here bends and turns.

The armies of the centre, the group of Prince Leopold of Bavaria, started latest of all. These were the forces which for half a year had lain quiet along the Bzura and the Rawka. When the wings of the Russian army had been driven back, the German centre moved. It has travelled with astonishing rapidity. From Warsaw, which fell on August 5, to Kamienetz Litovsk, where the centre armies are to-day, they have covered more than 150 miles in three weeks. Yet the several places of the army groups were so adjusted to one another that when Warsaw and Ivangorod fell and the Vistula was crossed, Gen. Hindenburg, Prince Leopold, and Gen. Mackensen touched hands for the final effort, the complete envelopment or destruction of the Czar's armies. That solid curve, like a gigantic sickle, is still sweeping east.

A NATIONAL DEFENDER FOR POLITICS ONLY.

Secretary Garrison's rebuke of Gen. Wood for inviting and allowing Mr. Roosevelt's violent harangue at the Plattsburgh camp naturally pains the Colonel. Why, he explains, he never once mentioned the President or the Administration. No, he simply attacked Mr. Wilson by covert insult, and assailed the Administration by innuendo. The fearless man! Moreover, he made his speech "outside the line of tents." This from the great hater of technicalities!

What must chiefly rankle in the Colonel's gallant breast is the official statement that he was at Plattsburgh merely as a politician, for the sake of stirring up "controversy, antagonism, and ill-feeling." Does not Secretary Garrison know that Mr. Roosevelt is one of the greatest military authorities on earth, at whose feet the bankers and merchants and city officials learning to be soldiers would be glad to sit? There is said to be in existence in New York a photograph sent to a friend here by the German Emperor. It showed Roosevelt and William at a military review; and at the bottom was written, in the Imperial hand: "Col. Roosevelt instructing the Kaiser in the art of war." Whether this tale be veracious or not, we cannot say; but everybody knows that Mr. Roosevelt would not have hesitated to instruct Cæsar, Cromwell, or Napoleon in the art of war. And to think of treating such a man, at such a crisis, as if he were a mere trouble-maker! If the Secretary of War was unaware of the Colonel's supreme military competence, he might at least have spoken of him as a sage, as a retired statesman in whom old experience had attained to something of prophetic strain. But no such roses grow over Secretary Garrison's party wall. He speaks of the ex-President as if he had become well known as merely a Shimei, promiscuously cursing all passers-by.

We are bound to add that the great majority of Americans see in Mr. Roosevelt's present activities only an attempt by him to make use of a troubled situation in order to get a party and personal advantage out of it. He is flinging himself upon the idea of a possible war, and of preparing for it, only as the most promising political issue which he can at present see. It cannot have been forgotten that he not long ago pointed to himself as the only man who could "tear to pieces" President Wilson's foreign policy. This was put in evidence at the trial of the Barnes libel suit. Since then Mr. Roosevelt has lost no occasion to seek to embarrass and discredit Mr. Wilson. In this effort he has, it is true, made only a series of blunders. He railed at the Lusitania note, before he knew what it was, and immediately thereafter ran away and kept ingloriously silent. He rushed into print about the case of the Arabic, demanding "deeds" instanter; and now has to read of the complete yielding of Germany to the American diplomatic contention, for which Roosevelt had nothing but scorn. Thus he has made a good deal of a mess of it, so far, in his endeavor to tear the President in pieces; and has the mortification of seeing the country rallying strongly to Wilson. This, however, does not obscure the animus of his bitter assaults, which is purely self-seeking and partisan. He is an improvised national defender for politics only.

That this is not an isolated judgment of Col. Roosevelt may be seen from the article by Dr. W. J. Tucker, formerly president of Dartmouth, in the last *Atlantic*. He is writing of the development of the social conscience in this country, and pays an adequate and even warm tribute to Mr. Roosevelt for what he did to rouse public attention to public wrongs. But he feels compelled to touch upon what he calls the "moral limitation" of the man, which he finds in his insatiate desire to push himself forward,

and in his monumental "egoism." Moreover, Dr. Tucker goes on:

> He is the sportsman in politics. He follows the game. He plays the issue which has the immediate political effect. He has his eye constantly on his antagonists, who for the time are his "enemies." These must never be lost sight of, though principles may be retired from view.

Recent events must have confirmed the justice of this analysis, in the mind of multitudes of Americans who could not before bring themselves to believe it. But they have now sorrowfully seen the evidence. They have observed the course of a man upon whom they had heaped high their honors. In a year of great national stress, they have witnessed him restlessly scheming, not only to thwart and decry the Government of his own country, but to imperil the peace which the President and the great mass of the people have been so anxious to maintain. And all this in a desperate striving to score a point against a party opponent, and to contrive, by any means within reach, to get himself once more at the front of the political line of battle. This is the pity, this the shame, of Mr. Roosevelt's conduct. Fortunately, it stands so plainly revealed to the gaze of his countrymen that his power to do mischief, except to his own reputation, is rapidly being reduced to the vanishing point.

"LET US NOW BELITTLE GREAT MEN."

Thus should the quotation be modified for the warring nations. Each is discovering that its antagonists, despite strange traditions to the contrary, have always been barren of geniuses. Some might expect Germany, nursing her own culture and hatreds, to traduce the foreign great more vehemently than the Allies, who insist upon their liberalism; some might expect the insular British or impulsive French to be more extreme. But when we see the same astigmatism in all, the motive apparent is each nation's consciousness of the necessity of blackening its opponent in order to fight with a good heart. It is not possible for a German lover of British literature, or a Russian admirer of German scientists, to smite with the zest of one who despises the smitten; and the very grotesqueness of many of the slanders makes it incredible that they are believed in except as moral narcotics. Others are evidence of the purest spleen.

Where contemporaries are concerned, and no generalizations made, the evil is at a minimum. Little harm is done when the Germans state that D'Annunzio is a monkey, and Henry James a literary cuttlefish discharging his ink-pot, or when the French declare that Haeckel and Ostwald have no backs to their heads and cannot help betraying the fact. It is when the cudgels are laid about in those literary arcana supposed to house the securely great, and the moral is drawn that the entire history of a nation shows it decadent, that rancor becomes dangerous. Prof. A. H. Sayce, of Oxford, for example, has recently informed readers of the London *Times* that Schiller, "the most German of German writers," was "only a milk-and-water Longfellow"; that Heine was a Jew, and "regarded the Germans as barbarians"; that Kant was more than half Scotch, and that "it is difficult to say what the Hegelian philosophy would have been had the German language been more cultivated."

The Teutons, to be sure, wandered earliest and most blindly along this path; it was they who instituted *Völkerpsychologie*, by which historians, geographers, and ethnographists explained the superiority of the Teutonic race over all others, and by which Mommsen, brushing aside Shakespeare and Dante, wrote fifty years ago that "the Greeks and the Germans alone possess a fountain of song that wells up spontaneously; from the golden vase of the muses only a few drops have fallen on the soil of Italy." Treitschke, with an indulgent liking for Molière and Mirabeau, found abundant opportunity to jeer at the great of the nation where all were "Baconians, shallow utilitarians, narrow and selfish islanders, hypocrites with the Bible in one hand and a pipe of opium in the other." But no nation has failed to pay some heed to the voice of mingled national arrogance and international jealousy, as we can see by going back to our own relations with England a century ago.

It is even pretended that there may be a benefit in these campaigns of belittlement, as being declarations of the cultural independence of a nation. When a Russian gravely writes that the Germans have produced not a single great sculptor, and have only borrowed foreign architecture and spoiled it, the Russian builder—unless he is provoked to laughter—will take courage to employ his own styles. When an Englishman declares that Bach and Mozart are the sole warrant for Germany's claim to musical greatness, and that "it is agreed that the Germans are now surpassed in music by other nations," it is thought that the way is paved to a national school of composers. Fetiches alone have stood in the way of self-expression. But it is clear that the highest intellectual declaration of independence can be built only on full knowledge and correlation of what intellectual leaders in other lands have accomplished. The liberal spirit behind a full recognition of other intellectual lights is in itself a prerequisite. The true leader of an independent movement could hardly be blind to fundamental interdependences. Emerson's "American Scholar" was the product of the same period as the "English Traits," which has a noble enthusiasm for the geniuses dead and living to whom we were then in leading-strings; and it would be hard to point to men of more broad and humanistic feelings than Herder, Lessing, Goethe, and Schiller, who gave Germany her first full mental independence.

The violence of this genius-baiting is a token of its brief life and of the special purpose for which it is employed. The contradictions are too palpable. In conflict the French must realize they are using German drill tactics, and the Germans that their wireless is Italian, their Dreadnoughts English, their aeroplanes, automobiles, and submarines perfected chiefly by the French. It is impossible to vilify Goethe without vilifying Carlyle, or to minimize Curie without minimizing Hertz. In the first reaction following the end of the struggle, it is easy to believe that the nations which are on record with the fewest utterances of such a tenor will be glad to call attention to their comparative generosity.

SHOULD ONE LOVE AUNT SARAH?

This question, which millions of little boys and girls have puzzled over, and frequently decided in the negative, is raised to the dimensions of a social problem by a writer in the *Atlantic*. It is one phase of the broader problem of the relations between the younger and older generation. For the latter our author has very little use, though, without mentioning the fact, he probably recognizes that the older generation does serve a purpose in propagating the younger. Otherwise the seniors are a nuisance. Here is one count in the long indictment:

> The great complaint of the younger against the older generation has to do with the rigidity of the social relationships into which the younger find themselves born. The world seems to be full of what may be called canalized emotions. One is "supposed" to love one's aunt or one's grandfather in a certain definite way, at the risk of being "unnatural." One gets almost a sense of the quantitative measurement of emotion. . . .

It is those dry channels of duty and obligation through which no living waters of emotion flow that it is the ideal of the younger generation to break up. They will have no network of emotional canals which are not brimming, no duties which are not equally loves.

Loving Aunt Sarah, in other words, should be like the resistless march of the tides, and not like the Gowanus Canal. Solicitous inquiry after Aunt Sarah's rheumatism should be dictated by M. Bergson's vital urge, and not by a stupid sense of duty.

Canalization is vexation. Aunt Sarah is only one example of our thoroughly canalized society in which love, duty, loyalty are made to flow through sharply defined channels. Radical youth is fond of its own vocabulary, which changes with the seasons. It works its pet words hard. Until very recently, for example, life in the progressive vocabulary was usually described as "reaction." You reacted to the social impulse, you reacted to a sunset, to Caruso, to an endive salad. Reaction is now making way for canalization. One imagines the fashion began a year ago with the outbreak of the war when military writers spoke of the fortresses on the French frontier as intended to canalize the flow of German invasion. The word caught on. Where formerly to be only moderately forward-looking was to be stagnant, to-day it is to be canalized. There is something impressive about stagnancy. There is no excuse for a sluggish, humdrum flow between definite containing banks. Yet canalization is a good word, and there would be no reason to complain, if the very fondness of the young for pat phrases were not itself an index of the irresistible human tendency to canalize. The radical indictment against society tends to the same painful sameness as the society which it criticises.

The fact is, of course, that canals are a very useful invention. Marshes have been drained and made fit for human cultivation by canals. Life in New Jersey will be made really worth living when enough ditches have been built to wash out the mosquitoes. The great upheaval of the tides is not enough. The tide pours in and leaves pools behind for the enemy of mankind to breed in, whereas a scientifically planned system of canals permits the tide to pour in and out again, carrying with it one of the most pervading of contemporary anti-social elements. It is the same with the dry lands of the West. Up in the hills lie the brimming reservoirs of saving water. They can work only through the irrigation canals. Sometimes the ditches are permitted to brim over. Sometimes a mere trickle is enough for the great purpose which is to render the desert fruitful. A young person who acted only when the emotion seized upon him would be an unsafe gate-keeper at the Roosevelt dam. In itself there is nothing immoral, nothing essentially anti-social, about a network of canals.

It is the same with Aunt Sarah. In the course of evolution it has been found more useful for the race that it should love its aunts rather than hate them; though it is, of course, a matter of degree. People perhaps began by loving their children, their parents, their brothers and sisters, and gradually extended the internal waterways of their affection so as to include aunts and grandmothers. It is true that in the course of evolution a function or an organ may outgrow its usefulness for the race. It may be no longer necessary to love our aunts. It may not be necessary, for that matter, to love our mothers and offspring. Love spontaneously pouring itself out on any one is undoubtedly the ideal. But the human habit of canalizing affections is still very strong. One may not feel the obligation to love one's aunt, but then it is very likely that you will love the member of your trade-union. Free yourself from the sense of compulsion to love your mother and there will still exist the obligation to love your fellow-members in the Fifteenth Assembly District Local of the Socialist Party. Or is there to be no obligation there, either? It may be. Only one imagines it will be rather hard to keep intact the organization of trade-unions and party locals if the members feel at liberty to dislike one another. A certain amount of canalization is necessary.

The final question remains whether the "notorious Victorian era" of which our writer speaks was really as completely canalized as he supposes. One imagines that the Victorians recognized the existence of tidal waves and recessions, and allowed for them. Not to love Aunt Sarah may have been described as "unnatural," but the Victorians knew that it was very natural for little boys and girls to be unnatural in that way. When Aunt Sarah sent down big Christmas boxes, when she organized picnics in the grove with many sandwiches thickly buttered, when she told stories at bed-time, we loved her. When she insisted on a very thorough washing behind the ears, when she put prying questions about school, we were unnatural, and she grimly acknowledged the situation; perhaps not so grimly after all. The Victorians said "unnatural" as the young generation now says "canalized"; because it was the fashion. They had no illusions as to the real status of aunts. Does the writer in the *Atlantic* recall what one Victorian wrote of aunts?

> Oh, that the gracious powers would send me an old aunt, a maiden aunt, an aunt with a lozenge on her carriage and a front of light coffee-colored hair. How my Julia and I would make her comfortable!

This has a fairly uncanalized ring; it sounds almost modern.

Foreign Correspondence

THE FATE OF WATERING-PLACES—THE CASE OF THE ISLE OF MAN—SPAS FOR WOUNDED SOLDIERS.

LONDON, August 10.

The scriptural prediction that, in times of national turmoil, "the one shall be taken and the other left" applies in these days not only to persons, but to places. Within the United Kingdom the effects of the war have been felt with marked inequality in various towns and districts. To some it has brought, for the time at least, exceptional prosperity, while others have been suddenly reduced almost to privation. During the present holiday season, the experience of the best-known pleasure and health resorts has provided many examples of this diversity.

One of the worst sufferers has been the Isle of Man. Normally, the island derives its main livelihood from its visitors. With a population of 50,000, half of them resident in the town of Douglas, it is accustomed to welcome every summer a quarter of a million outsiders. This year the number of its friendly invaders has dropped to zero. Douglas is a desert, and its magnificent promenade, with two and a half miles of boarding-houses, is as bare as in December. There are no boats running regularly to and from the mainland, the steamers of the Isle of Man Packet Company having been commandeered by the Admiralty. The occasional activity of German submarines in the adjacent waters would in itself have been sufficient to discourage holiday travel.

A public-spirited Wesleyan Methodist minister, the Rev. C. Copeland Smith, has been making an effort to meet the emergency. He was himself once employed in a Leicester hosiery factory, and he has been using his special knowledge of the business to introduce the manufacture of hosiery as a local industry. He has obtained a War Office contract for a quarter of a million socks, and is organizing the supplying of private purchasers as well. Mr. Smith is also attempting to revive an old Manx industry which in recent times has become almost obsolete—the fate of traditional occupations in so many other pleasure resorts—because the catering for visitors has been found to pay better. In the days when every Manxman was a fisherman, every Manx woman used to spin and weave wool and make garments. An association has now been formed to obtain an adequate supply of yarn, and to give the technical training necessary for the restoration of this ancient handicraft.

The watering-places along the East Coast of England, from Whitby to Margate, have become victims of the war, though for a different reason. Stories of bombardment and air raids, some of them authentic and others greatly exaggerated by rumor, have scared away prospective visitors, especially those with families. In some parts the billeting of soldiers has brought a certain financial compensation, but in many previously popular resorts there are so many vacant rooms just now that a holiday-maker bold enough to make the venture could obtain accommodation at unprecedentedly cheap rates. There are even instances in which entire households of all-the-year-round residents have migrated to places supposed to be safer from hostile attack. In a minor degree, seaside resorts far removed from the danger zone, but at a distance from London and other centres of population, are suffering loss of custom.

This loss to the more distant places has brought corresponding gain to those near London. Visitors who would otherwise have spent their vacations in Wales or Devon or Cornwall are taking shorter journeys to the seaside towns of Hants and Sussex. Such places as Brighton and Eastbourne are reported as over-full. During the week-end of the August Bank Holiday the trouble in these towns was not from slackness, but from congestion.

An especially interesting feature of war conditions has been the revival of the prosperity of the English spas. This has been brought about by two distinct causes. In the first place, the usual contingent of British visitors to the spas of Germany and Austria has been compelled to stay at home. Of recent years it has been the fashion not only for invalids, but for overworked professional and business men, to "take the waters" at Homburg or Carlsbad. It will be remembered that, when the war broke out last August, many hundreds of such persons were held up in German or Austrian territory, while others endured no little hardship and privation in the rush homeward. Had the outbreak of war been delayed by two or three weeks, four or five times as many would have found themselves in a sorry plight. In so far as these British frequenters of foreign baths were *malades imaginaires*, the real ills and excitements of the war have by this time cured their megrims and released them from the care of the doctors. But those for whom medical treatment is still a necessity are this August obtaining what they want without crossing the Channel. They are discovering that within their native country there are waters quite as beneficial as any in Germany and Austria, with appliances as scientific and an environment as attractive.

The English spas are prospering, in the second place, because of their proved value for disabled soldiers. In thousands of cases, after the resources of surgical and hospital treatment have been fully utilized, there remains an urgent need for the very services that these spas can efficiently render. Not only the wounded, but sufferers from neuritis, rheumatism, shock, and disorders of circulation need just such a "cure" before their recovery can be complete. During last winter this matter engaged the attention of the section of Balneology in the Royal Society of Medicine. Early in the year there was formed a committee on which the War Office was represented, and local committees to work in coöperation with it were set up at the various resorts. Information was collected, and the War Office circulated among the military hospitals a pamphlet giving particulars of the conditions for which waters and baths were appropriate, together with a schedule of places and treatments offered. An organized system is now in operation for enabling these facilities to be put to the best possible use.

Foremost among English spas is the historic city of Bath. It is now reverting to one of its most ancient functions, for it served precisely the same purpose in the days of the Roman occupation of Britain. During the Roman period certain health resorts in various parts of Europe obtained considerable celebrity as "soldiers' spas," for it was found that bathing in their waters allayed the pain of wounds, promoted healing, and restored the use of stiff and swollen limbs. In an atlas of ancient history one may find such place-names as Aquæ Aureliæ (Baden-Baden), Aquæ Mattiacæ (Wiesbaden), and Aquæ Sextiæ (Aix). Bath itself figures in the map of Britain under the Romans as Aquæ Solis. Its waters not only helped to restore the Roman legionaries, but, many centuries later, brought healing to the soldiers of Marlborough and Wellington. Fortunately, Bath is well prepared to play her present part, inasmuch as the curative properties of her waters had been receiving special attention for some years before the war. In 1912 an analysis by Sir William Ramsay, revealing the exact proportion of radium in these waters, provided a new basis for clinical investigation, and suggested new methods for their use. Since then important research work has been carried on in connection with the Royal Mineral Water Hospital, whose new laboratory for studying the pathology of rheumatoid arthritis was opened by Sir William Osler in June of last year. The reports of the opening ceremony described how those who took part "made a tour of the wonderful Roman baths, among the colonnades of which and into their green depths luxurious sunlight poured." It is Aquæ Solis still.

Part of the "cure" of Bath lies doubtless in its delightful natural surroundings, including the neighboring hills, with their exhilarating air. The same health-giving properties are possessed by the environment of the other English spas, all of which are now making their contribution to the recovery of men wounded and shaken in the war. Among them are Cheltenham, rich in its magnesia and alkaline waters, and protected by the Cotswolds from the biting east winds; Buxton, another health resort of Roman soldiers; and Harrogate, whose sulphur springs are world-famous. Across the Welsh border is Llandrindod Wells, a spa in the making, with springs that show a remarkable variety of medicinal constituents and with a bracing climate well fitted to provide the final stage in a therapeutic treatment that has begun further south. The conditions of the war have made themselves felt not only in an increased recourse to the baths and drinking-places themselves, but in a greater demand for the spring waters for use elsewhere. At St. Ann's Well, at Buxton, for instance, the bottling staff has been more than doubled since the war began. It need scarcely be added that, in the spirit of willing service that is a characteristic of all England to-day, the invaluable resources of these spas are being placed at the disposal of wounded soldiers with eager generosity. Properly accredited members of the fighting forces may have access not only to the waters, but to courses of treatment, either without payment or at greatly reduced charges. Not less readily than the dockyards and the munition factories, the pump-rooms and wells are "doing their bit." H. W. H.

SPIRITS OF WAR AND PEACE—SOLDIERS ON LEAVE OF ABSENCE—THE APPEAL TO FRENCH WOMEN—PAUL SABATIER.

By STODDARD DEWEY.

PARIS, August 14.

Madame de Witt-Schlumberger, the names of whose mother and grandfather, the historian Guizot, were household words in the America of my childhood, writes me a few simple lines which I may publish without indiscretion. For it is essential that, in the United States, those who love Peace should not love it at the price of all that makes life worth living. At the same time, as President of the French Union for Women's Suffrage, Madame de Witt-Schlumberger sends the "Appeal to French Women," of which 55,000 copies have been distributed on every side. She also encloses the French text of the letter which M. Paul Sabatier, with whom she is in correspondence, published at the end of last year in London on this question of peace—a letter to which he still adheres. Madame de Witt-Schlumberger says in her own name (August 9):

"It is because I am an ardent Pacifist that I do not believe in any possibility of peace at present; the conquering Militarist spirit—which *must* disappear—is still too much alive. And yet—my five sons and my son-in-law have been called into active army service; one is a prisoner, another is dead, and the four others are at the front."

The "Appeal" has its occasion in the permissions to visit their families which are now being given, by relays, to soldiers absent at the front for many months, some of them from the beginning of the war a year ago:

"French Women—A certain number of permissions are to be granted gradually to soldiers of the front, in so far as the necessities of National Defence will allow: some among us are going to have with us again for a few days husband or son, *fiancé* or brother! . . .

"French Women, all we who are sisters in the love of our country and in our duties toward the National Defence, let us not forget that we are going to be put to a hard test; think how the whole world will be able to judge the quality of our soul and the worth of the spirit which animates us; it will know by the way we welcome back our soldiers, and most of all by the way we let them depart once more, whether we are women worthy of France, or whether we are only poor loving creatures, mothers unworthy to be the mothers of French soldiers, sisters without courage, and betrothed ones without moral worth. . . .

"Surely, we have no reason to doubt the good result of this experiment of visits to families: the attitude of French women, from the beginning of the war, their courage and devotedness, are a sure guarantee of the firmness with which they will know how to face this new responsibility.

"Soldiers come to us from the front, full of courage and life, as we know by the wounded we care for and the letters we receive. Shall we send them back, at the end of their few days, strengthened by the tenderness of which they have been so long deprived, or shall we weaken them by our tears and regrets? . . .

"Remember that we have not the right to be weak, and that the tenderness which enlivens proves a greater love than the tenderness which softens. Our soldiers will not be deceived.

"Any woman who, at the present hour, weakens in a man his sense of duty towards our country would be a criminal. When the fight is on, not for our country alone, but for the principle of right and justice in the world, duty should be accepted, not as a heavy burden, but as an honor and a joy.

"French Women, my sisters, we shall be able to wait with patience and without repining for the day so longed for when we shall be together again with our own; we shall be able to understand that our most lawful desires must be subordinated to the needs of the National Defence; we shall know how to take on ourselves all our responsibilities. We shall be worthy of the imperious and higher duty that is incumbent on us."

The experiment of allowing soldiers who have suffered hardship for so many months to come back for a few days to the atmosphere of love and home is succeeding—in a way of which few Americans would dream. But it must have been intended all along by Gen. Joffre, who knows his people. It is in line with the now historic cartoon of the artist Forain, by which he expressed in the first months of war the real point of gravity. One soldier is saying to another: "Provided only they hold out!" "Who holds out?" asks the other. "Why, the civilians, of course!" So, among the recent *permissionnaires*, an intelligent, uneducated Parisian—a graduate of the great university of Paris streets—confided to me an effort at expression: "Notre moral est beaucoup meilleur!" By which he meant, not that soldiers' morals are superior to civilians'—though that, too, may be defended—but that it is those who are bearing the heat of the day and the brunt of danger who have the most enduring courage and confidence in the end. Their visits home have notably toned up the spirit of the French civilian population.

This renders the words of Paul Sabatier still timely, and indeed he persists in uttering them: "A Frenchman cannot, here and now, pronounce the word of peace. It would be something resembling treason. . . . We are battling for ourselves, no doubt, but we are also fighting for all peoples. The idea of stopping before reaching the end cannot come to our minds—and we have trouble in understanding how it can come to the minds of lookers-on. We are grateful for their good intentions, but we are somewhat disconcerted to think they are more preoccupied with our physical life than with our moral life.

"Our soldiers are martyrs, since they bear testimony to a new truth. Their defeat would be, for Europe, the triumph of brute force relying on two spiritual forces which it has mobilized—science and religion. Before we can allow that, it is our 'duty' to struggle without even thinking what may happen from it. And if our soldiers die to the last, those who have not yet taken up arms will struggle on to the last cartridge, to the last stone of our mountains which we may be able to throw against a 'Kultur' that is nought but adoration of the sword and the golden calf. . . .

"Justice comes first and peace afterwards—there is no true and enduring peace that is not founded on justice. . . .

"This is what our soldiers—I see it in their letters—this is what our peasants—I hear it in their conversations—feel and understand better than I can express. What the France of the Crusades was stammering, what the Revolution saw by glimpses, France of to-day wishes to realize. She believes with all her strength in victory, because she has an indomitable faith in the ideal of justice and truth which she carries in her heart. But she has no need to believe in victory in order to fight, for to give up the struggle would be to betray her past and her ideal—her 'vocation.' And if she should die at the task, what matters it—if she has done 'her' work!

"Vive l'Italie! [M. Sabatier was writing to his friends of Assisi.] And may 1915 secure to the eldest of Latin nations the material and spiritual victories which shall give health to the geography of Europe and settle civilization on new foundations!"

I am not presumptuous enough to restore to their authors' English the numerous testimonials which American professors have spontaneously sent to Ernest Lavisse, the man who more than any other represents the University of France. He has published them in French, for common edification. Besides sympathy, and the feeling that "Germany has made herself guilty of the greatest crime of history," they all manifest the sense of duty—"to bring all our energies to bear on the establishment of international justice and loyalty." One who says "We can do nothing but remain neutral," confesses "We know that, at this very moment, you are combating for us."

Professor Lavisse is impressed by one of these Americans, who says openly that Germany has been "possessed by a depraved national philosophy," and the Frenchman, who, beyond contradiction, loved peace with Germany until it became impossible, adds mournfully:

"The day when so many German *intellectuels* made public declaration of their love for Prussian militarism, the inspirer and support of this philosophy of crazy pride, German intelligence indeed lost its right to a 'respectful hearing.' The day is near when other intelligences—for happily there are others—shall reproach it with having given consent and love to 'the greatest crime of history.' Freed from excessive admiration for Germany, they shall labor, each according to its own genius, in that fruitful and harmonious diversity which is the glory and the beauty of the human spirit. All shall labor, stirred and moved as they are by so great a drama, by so many horrors and ruins and sufferings. And those will work best who shall have suffered most cruelly, among whom ruins venerated as very holy relics shall protest against the enormity of the German crime. And I hold it for the most certain thing in the world that, amid this competition of free genius, humanity will honor with particular esteem the intellectual life of France—for the reason that, if there is one soul which, feature by feature, is opposed in absolute contrast to the German soul, it is ours."

Pan-Americanism

OUR INTERNATIONAL DEMOCRACY, THEN AND NOW: THE LESSON FOR THE PRESENT REVEALED IN THE PAST.

By RICHARD DANA SKINNER.

When Mr. Theodoric Bland, one of three United States Commissioners, called upon the Dictator of Chili a little less than a century ago, he had occasion to refer to an international situation with which we are rather painfully familiar to-day.

Mr. Bland took great care to remind his host that "while the contending and warring monarchs of Europe, pursuing a policy peculiarly their own, and with which the United States is fortunately not entangled, had closed every channel of commerce against each other, the peaceful republic [the United States] became the same carrier to them all."* In other words, he made it very plain that Chili, which at that time could boast of no merchant marine, should consider herself distinctly blessed in having the neutral United States as a cordial neighbor.

But as Mr. Bland was far more than a mere agent for American shipping, he hastened to add that the United States, having once been colonies themselves, "could not but feel a very strong sympathy in favor of the people of South America, who, they were induced to believe, were not only struggling to throw off an odious colonial system, but also to establish for themselves republican institutions."†

The Commission of which Mr. Bland was a member was sent by the President in 1817 merely to investigate the local South American conditions and advise the State Department whether the time seemed to have come for recognizing the independence of the Spanish colonies. But the important point for our purposes is that, after coming in contact with South American statesmen, these Commissioners urged far more than they were expected to urge. They urged, not in their official reports, it is true, but in familiar letters, the actual establishment of an American "system," a sort of experiment in international democracy among states unfettered by monarchical interests.

One member of the expedition, for example, writes home from Buenos Ayres, March 11, 1818: "The period, I hope, has arrived in which we shall cease to be deluded. It is high time for us to regard with the deepest interest, the situation of our brethren to the South. Our political salvation is intimately blended with theirs. The monarchs of the Old World have formed what they impiously term a holy league, for the purpose of patching up, and preserving the ancient system. . . . The free governments of the New World are the subjects of their deadliest hatred. These ought also to unite in defence of everything sacred. Such, I hope, will

*American State Papers, Foreign Relations, Vol. IV, p. 293.

†*Ibid.*

be the views which our Government will now take."*

This letter would be noteworthy if only as one of the earliest clear expressions of Pan-Americanism. But when we remember that it was written over five years before the issuance of the Monroe Doctrine, and was inspired by association with South Americans, it assumes a distinctly modern as well as historic value. For we are all too prone to praise the part of England in Monroeism, and to forget the pressure exerted at a much earlier period by the South Americans themselves. During the entire stay of the Commissioners in South America, no opportunity apparently was overlooked to fill their minds with Pan-American doctrine.

To mention but two of these occasions, a certain soldier in Buenos Ayres was condemned to be shot for insubordination. Our Commissioners as a special favor requested the man's life, which the supreme director at once granted. A local newspaper, commenting on the affair, declared with reasonable pride that "such is the early influence in the cause of humanity of an union between the two great parties of the new world."† And, again, on the occasion of the recognition of Chilian independence by the Argentine Government, the *Gazette Extraordinary* of Buenos Ayres published the grateful letter of the Chilian envoy, in which he said: "Whoever has observed the spirit of this people . . . cannot doubt that Chili, no longer the patrimony of an imbecile and tyrannical dynasty, will, henceforth, emulating her elder sister, the great republic of the north, be, also, an abode of freemen, an asylum for the oppressed of the human race. I congratulate Your Excellency upon an event, which will have so favorable an influence upon the common cause of Americans."‡

By subtle courtesies, by official and semi-official suggestion, and even by direct solicitation, the South Americans did all in their power, as they seem to be doing again today, to invite and obtain our generous co-operation in the establishment of a representative American system. As an instance of their direct pressure, I have been especially struck by a letter from Don Manuel Torres to our Secretary of State, then John Quincy Adams. Torres was physically a rapidly failing man. The greater part of his life had been spent as an agent of Colombia at Washington, where, despite ill health, he had worked unremittingly to effect the independence and recognition of the country he loved with a real and deep passion. His faith in the future of Colombia was inspiring to all who knew him, and he numbered among his friends many of those who were soon to shape our Latin-American policy. His official letter to Mr. Adams was written on November 30, 1821, a full two years before the Monroe Doctrine.

"All South America, formerly Spanish," he declares, "is emancipated—that is, upwards of eleven millions of souls; this has given a new importance to the new world, and now they are no more afraid of the machinations of the Holy Alliance to keep America dependent upon Europe, and to prevent the establishment of free Governments.

"There has occurred a project, long since formed, to establish a monarchy in Mexico, on purpose to favor the views of the Holy Alliance in the New World; this is a new reason which ought to determine the President of the United States no longer to delay a measure which will naturally establish an American alliance, capable of counteracting the projects of the European Powers, and of protecting our republican institutions."*

Whatever virtuous claims Mr. Canning may have made to calling the new world into existence, one is tempted to revert with distinct pleasure to the evidences that the Latin-Americans had a very considerable share in establishing their own existence, and in obtaining the famous sanction of the United States. Lafayette's opinion on this matter, it seems to me, should have a notable place among our classics. "How do you find Mr. Canning's assertion in the British Parliament," he asked Henry Clay, "that he, Mr. Canning, has called into existence the new republics of the American hemisphere, when it is known by what example, what declaration, and what feelings of jealousy the British Government has been dragged into a slow, gradual, and conditional recognition of that independence?"†

Manuel Torres, whose zeal for all-America had alone sustained his last years, lived just long enough to have the honor of being recognized by President Monroe as Chargé d'Affaires from Colombia. He died on July 15, 1822, confident, probably, that his dream of an American federation would soon be realized. The Philadelphia *Aurora* must have felt a prophetic fear when it said, the day after his death, that, "perhaps, to Colombia and the whole of Spanish America, the loss is irreparable; nor is the departure of this rarely gifted man a light consideration to those interests which naturally unite the Northern with Southern America, in that great communion of security and unity."‡

The removal of the great statesman's influence at Washington did, in fact, prove irreparable. The Monroe Doctrine, as it was finally issued the following year, would have dashed his greatest hopes. To him it would not have been a true Pan-American document. It was too avowedly inspired by the individual interests of the United States. It contained little or nothing of that democratic idealism and unselfishness which he would have liked to see; and whatever measure of protection it indicated for republican institutions, it failed to found the inter-American relations upon generous coöperation.

The Doctrine certainly aroused some sentiments of sincere gratitude among the southern republics at the time, yet it could not but help to confirm a suspicion that our policy was still directed by that same individualism which characterized the "warring and contending monarchs of Europe." We are often sincerely puzzled, I believe, at the almost endless explanations and interpretations of the Monroe Doctrine which we are forced to issue for South American edification. That is probably because we are apt to consider the suspicion of the southern republics a typically modern development. It is of no little interest, then, if only as an explanation, to discover that even before the Monroe Doctrine appeared, and despite the unmistakable Pan-American efforts of certain South Americans, their suspicion of our motives was deeply rooted.

It did not even require the tangible fact of the Philippines to engender a mistrust of our territorial interests. At times this mistrust seized upon amusingly impossible rumors, as when a prominent Argentine planter, named La Rocca, during a conversation with Mr. Brackenridge, "enquired with considerable earnestness as to the truth of a report, of our Government having endeavored to obtain a cession of territory from the King of Naples, and laid great stress on the circumstance of our having no colonies, and from the nature of our Constitution not being permitted to have any. They said it was impossible for them to repose full confidence in the friendship of nations holding colonies."*

Doubtless, this would make an excellent meditation to-day for the lovers of the Philippines. At all events, it indicates a state of mind that has had no good reason to change, and which we should at least recall when trying to conciliate South America.

At other times, the long-standing mistrust took more practical forms. Even after our recognition of Colombia, Mr. Todd, who was our Chargé d'Affaires in Bogotá, was forced to write in confidence to Henry Clay that "the hopes of the public councils are directed to Europe, and especially Great Britain, in the vain delusion, that it is by those Powers alone, their interests can be promoted."†

Two years after the promulgation of the Monroe Doctrine, at the opening of John Quincy Adams's Presidency, there was an exceptional opportunity to correct this vague mistrust of our Americanism. We were invited, with some natural hesitancy, our manner having been decidedly chilling in the past, to send delegates to the first Pan-American Congress, at Panama. A prompt acceptance, such as Mr. Adams desired, would have cleared the air very pleasantly. But this opportunity for genuine courtesy was lost by the Senate. The delegates were finally sent, it is true, but only after weeks of the most determined Senatorial opposition, which effectually removed from our act all semblance of good

will. In this opposition, mere political machinations in defiance of the President were supplemented by some thoroughly Old World statesmanship. In fact, the importance of the Panama Mission, as it came to be known, was actually much better understood in Europe than by us.

M. de Chateaubriand, writing in the Paris *Journal des Débats*, spoke of the mission as "the most important feature in the foreign policy of the Anglo-Americans, a resolution . . . which . . . may consolidate the liberty of a whole hemisphere. . . . It is for the eldest daughter of American liberty," he continued, "to be the guide of her younger sisters, and to gain over them the empire of persuasion and friendship; let her show herself frank, disinterested, great, and generous. The noble post of being at the head of a new world is certainly well worth the sacrifice of a few dollars in duties and a few bales of cotton."*

And Lafayette was another to see the great possibilities of coöperation between North and South. In March, 1826, he wrote to Henry Clay, expressing his great relief that the Mission had actually left for Panama. His faith in the American system was implicit. "I believe it of high moment," he said, "for the welfare of South America and Mexico, for the prospects of mankind, and for the dignity of the people of the United States, that they preserve and exert the moral influence to which they are so justly entitled."†

The truth was that, quite apart from the political opposition, the Foreign Relations Committee of the Senate, which reported against the Panama Mission, was dominated by a man very poorly endowed with imagination. In the words of the Boston *Courier* of the day, Mr. Macon was "a very honest man, who makes it a point of conscience never, under any circumstances, to change his opinions or the cut of his coat. . . . Mr. Macon is a complete Chinese, as to all intercourse with foreign nations."‡

Mr. Macon's Orientalism was duly echoed in all the speeches of the opposition. He and his associates, with some of that cold reserve still exhibited by our statesmen, refused to see in the full coöperation of new republican governments an act characteristically different from the entangling alliances feared by Washington. He was the first of a line of men who, by a certain ill-disguised contempt for the Latins, have given to the South Americans some reason for believing us blind to those principles which should distinguish the relations of American states as "frank, disinterested, great, and generous."

At the present moment, when, as in 1818, the "contending monarchs of Europe" have "closed every channel of commerce against each other," the Monroe Doctrine certainly seems to defend itself against the least charge of obsolescence. But do we not owe it to our own highest interests, as well as to a true sense of international democracy, to ask frankly if it can defend itself against the charge of insufficiency?

The Latin-Americans, as I have tried to show from some hitherto rather neglected material, took the initiative in the Americanism of 1818-1826, when the tangled politics of Europe threatened to spread across the Atlantic. The Latin-Americans, it seems, are still compelled to take the initiative today, during a notable repetition of history. For that reason I am forced to the conviction that a very real problem of the immediate future centres in our readiness or refusal to meet that initiative with fair recognition, and to throw aside our cloak of semi-Oriental exclusiveness. It may not prove necessary to supersede the Monroe Doctrine by a new declaration; but I think that if we are to judge honestly from the very partial success of our past policy, we shall see the necessity of securing for the Doctrine a new sanction, and in so far of rendering it the declaration of all America.

Miscellaneous Idling

REFLECTIONS OF OLD AGE ON LIFE AT SUMMER HOTELS.

There must be a considerable number of elderly city gentlemen of no well-defined occupation who, when summer time comes around, find themselves, like the present writer, under the painful necessity of enjoying a brief vacation in the country. Men of this class—I can vouch for it—would much prefer to remain in town and pursue undisturbed that half-busy idleness which so well agrees with their constitution, but no! an anxious relative persuades them that what they need is change, with complete rest; so they pack their trunk, with a sigh, and go to the mountains.

The region is undeniably beautiful. Its charms unfold themselves, in varying outlines, to the gazing traveller, as the automobile that awaited him at the sleepy railway station takes him swiftly to the end of his journey. Here, then, is the mighty ravine, famed in literature, scarcely five miles ahead to the east. "You know the verse about that gorge?" queries the stranger in the automobile, and I (for none other is the traveller), with a vague, youthful recollection, weakly nod assent. The frowning rocks on both sides of the road converge menacingly. "The view is shut out completely by the ravine," I remark. "Yes, but there are glorious views from the top of the rocks near by," replies the stranger, "and the trail [here he surveys me rather critically] is not difficult to follow for any one who can climb at all." I turn aside, somewhat abruptly, to gaze at the peaceful lake nestling at the foot of the mountains that close the prospect. "A charming bit of nature!" I exclaim involuntarily. "Yes, but the lake is artificial," and I listen, with becoming wonder, to the story of how it took seven years to dig the basin out of the bowels of the earth. And now the automobile curves gracefully into the *porte cochère* of the spacious hotel, and my vacation has begun in dead earnest.

Let me state emphatically that at the first glance everything about the hotel seems promising. My room is quite large enough. It commands an extensive view, and more than sufficient closet space for my modest wardrobe. The dining-room and parlors are of generous dimensions, airy and well furnished, and a hasty survey reveals a suitable writing-room, combined billiard and card rooms, and a ballroom ample enough for any one who wishes to dance. The table I find in due time to be fully as good as I expected. (No one expects city fare in country hotels.) The guests, taken *en masse*, look refined and friendly—decidedly up to the average of country hotel patrons. I meet a friend, who introduces me to his friends. They are cordial and talkative, but I am rather tired, and excuse myself and retire to my room. Am I satisfied with my first experiences? Yes; I certainly ought to be. The place is quite as attractive as it had been pictured. Besides, one ought not to judge by first impressions.

De Tocqueville says (chapter on "Public Association"): "I have always admired the extreme skill with which the inhabitants of the United States succeed in proposing a common object to the exertions of a great many men, and in getting them voluntarily to pursue it." I had a very pretty illustration of the truth of this observation next morning, immediately after breakfast, when the eager golfers of the hotel assembled on the porch, exchanging records and discussing the outlook. Amid much bustle and hilarity, two huge automobiles, packed to overflowing, took the party—men and women, arrayed and equipped as became their common object—to the golf links, two miles up the road. Though I protested that I did not play golf, I was persuaded to join the company, so that I might enjoy the view from the golf links on the very first day. "The finest view east of the Rockies," said a much-travelled and emphatic gentleman.

The view was, indeed, superb; but was it finer, or less fine, than the view from another mountain plateau, in another region, which another emphatic gentleman, three years ago, within my hearing, pronounced "the finest east of the Rockies"? Why will devotees of Nature spoil our enjoyment of her beauties by useless comparisons and deceitful superlatives?

I slowly drank in the panorama spread before me, as I sat on the porch of the clubhouse—for more than an hour, I should say. Then I strayed to what looked to me like the starting-point of the golf course (I do not know the technical name). Gradually, a few players approached the spot and prepared to start the game. I proceeded to ask one gentleman how long

the course was, but was quickly hushed by my friend (one of the golfers), who whispered to me not to disturb the players. I will admit I was uncomfortable, and I strayed back to the porch, where I sat for another hour, and watched the players until they passed out of my sight. I really envied their zeal and skill, and yet there was something about it all that displeased me. Was it the knowledge that I had displeased *them?* What was it Disraeli said about our either excelling men in their accomplishments or despising them? What an old cynic he was! On the whole, I decided not to visit the golf links again.

After luncheon, while I was comfortably sitting in a rocking-chair, my neighbor (a gentleman of about my own age) asked me, after some preliminary remark about the weather, whether I did not find this a splendid place to rest in. I assented, and we both rested silently for some time. Then I arose and walked towards the lake. Several young persons were swimming in it, and near the further shore an elderly fisherman, standing in a boat, was casting a line for trout (I believe that is the right expression). The whole was a pretty scene. "Fine, isn't it?" exclaimed some one suddenly (not much younger than myself) who had halted in a brisk walk, just to give me a friendly greeting. "I hope you are enjoying the place. Nothing like it anywhere for variety. You will find something to do every moment of the day—climbing, golfing, fishing, automobiling, horseback-riding, tennis (for the youngsters), and plenty of other things in the day-time, and music, dancing, billiards, cards, and so on, in the evening. Are you going to stay some time?" I said I did not know exactly. I had come for rest, and did not play any game. In fact, I was not good at games, even in my younger days. But I enjoyed miscellaneous idling—even in the city. "A capital scheme!" answered my brisk acquaintance; "but I must have some exercise. Glad to have met you."

During the next few days I followed a certain régime. In the morning I walked all around the lake, a stretch of a mile and a half, and sometimes back again; then I fed the deer kept within an enclosure a short distance up the slope (the ascent is very gentle); afterwards I threw crumbs to the trout in the brook that empties into the lake (in the lake itself the fish would not nibble), and, in a general way, the forenoon passed less slowly than might be thought. But I am afraid the guests did not find me very communicative, though they certainly were polite to me, and some appeared quite willing to engage me in conversation. Directly after luncheon the mail arrived, and the reading of the papers took up an hour or more. Then I strolled once or twice around the lake, and perhaps visited the deer again, or looked in at the garage or the blacksmith's shop (where there was always something going on), and so the afternoon passed without much difficulty. But the evenings, I have to admit, dragged. Sometimes I listened to war-talk, but I refrained from taking part in it. I had promised my relative to be a neutral for two weeks. Besides, political discussion is hard work, and my injunctions were to be strictly idle. Billiard-playing (such as it is in my hands) I was allowed to do, but the table was generally preëmpted by younger men, and the only evening when I had a chance, a stream of ladies booked for the adjoining ballroom brushed past me and disturbed my aim and, I regret to say, my equanimity. I was never asked (how did they know I could not play?) to take a hand at auction bridge (or was it bridge pure and simple?). Reading, of an evening, was always rather difficult, as the light was never quite bright enough, except directly under the bracket lamps, where the same serious gentlemen (very nearly my own age) sat firmly intrenched night after night. Moreover, there was nothing to read. By supper-time I had exhausted my papers and those I casually picked up. "Summer reading" I abominate, and serious books were out of the question, in accordance with home instructions. The evenings, in fact, if the whole truth must be told, grew longer and longer (I could not easily stroll after dark, because it was damp, and the black flies were troublesome), and sometimes I went to bed earlier than is my custom. I forgot to mention that once or twice, just before supper-time, when few people were around, I played croquet with two bright boys, but they kept at some distance afterwards.

One sultry afternoon my friend pointed to one of the most persistent of the readers at the hotel, a rather oldish gentleman, who had been sitting motionless in an arm-chair on the porch for over an hour (how I envied his self-forgetful enjoyment of the book!); my friend, as I was saying, pointed to him and remarked: "Do you know that gentleman, the president of the ——— railroad? He told me a little while ago that of all the hard work he has ever done in his life the hardest is sitting in a chair with a book, and waiting for the day to wear out." "What!" I exclaimed, joyfully; "is he bored, too?" The spell was broken.

I rushed upstairs, locked the door of my room, drew the shade so as to shut out the view, turned on the light, sat down at my writing-table, and shamelessly *worked* —worked steadily for three hours, without once looking up. Never mind at what; enough, I worked.

"You look particularly well this morning," said an acquaintance next morning. "You are evidently enjoying your stay." "I am," I could now truthfully say. And I kept on enjoying it, three hours in the morning, three in the afternoon, and one in the evening, regularly, until I left.

I intend no reflection on Nature, the hotel, or the company. I was simply not attuned to miscellaneous idling in the country. The truth is, I like to see city people around me—in the city, no matter of what kind. "Die *schlechteste* Gesellschaft lässt dich fühlen, dass du ein Mensch mit Menschen bist," says wise old Goethe (the italic is mine). Not that I seek miscellaneous company by preference, but I can tolerate it—in the city. In Rome I do as the Romans do. And, by the way, speaking of Romans, we all know how Horace loved his Sabine hills, but the sly dog knew his Rome too well not to have loved the city better than his farm. And was not old Dr. Johnson—as honest a soul as ever drew breath—unhappy everywhere except in the streets of London? X. X.

Notes from the Capital

A GREAT AMERICAN CHURCHMAN.

Benedict XV, by his desire to confer the red hat upon Archbishop John Ireland, has certainly proved his courage. Again and again, under former Popes, Ireland's name has come up when a new Cardinal was to be chosen, but objections raised within the higher walks of the Church have prevailed, and the project has been dropped. The complaints against Ireland, so far as they have reached this country, have related to his advanced modernism and his independent manner of expressing himself. His critics have argued that he was overmuch identified with political and social activities unconnected with his strictly ecclesiastical duties. To his fellow Minnesotans, however, and to a multitude of Americans in all other parts of the Union, this very trait has endeared him as little else could.

The Archbishop's experiences in early life doubtless had a great deal to do with his liberality of sentiment. Born in Ireland, brought to the United States as a boy, but sent to France for his education for the priesthood, he came back to America just as our Civil War was beginning, and promptly volunteered as chaplain of an infantry regiment recruiting in St. Paul. He was known to its members simply as a pious adviser till, in the midst of a critical battle, they found themselves short of ammunition. Discerning instantly their trouble and a way to relieve it, he hastened back to the field stores, and soon brought to his comrades a load of fresh cartridges. All the rest of the day he ran hither and thither along the line, distributing these and encouraging the fighters with words of cheer. When night came, the regiment missed its chaplain from his usual place, and great distress prevailed till a searching party discovered him in a little hospital-camp which he had rigged up himself, where he was dressing the wounds of the disabled men and ministering to the spiritual comfort of the dying.

When, at last, he was stricken down with illness due to overwork and exposure, and was sent home with an honorable discharge in his pocket, nothing was too good for him in St. Paul. Not only has his influence ever since been immense among the people of his own communion, but citizens of all faiths have demanded his aid in their efforts for the moral welfare of the city and State. He is a fine speaker, with a keen sense of the dramatic, so that in the presence of a popular audience he can throw into a sentence or two, enforced by a vivid gesture, an appeal to the emotions

which carries with him many listeners who are impervious to the more carefully prepared argument. He never loses an opportunity of stirring the patriotism of his hearers and reaffirming his own devotion to the American ideals of free government. As a loyal Catholic and a firm believer in the importance of giving children a religious training in connection with their secular instruction, he has always wished that, as matters stand now, all Catholic children could be taught in parochial schools. But this interest has never lured him into hostility to our common-school system; and it is well remembered how, in the midst of a public address delivered while the school controversy was at its height in Minnesota, he suddenly exclaimed, with a fervor which thrilled the entire assemblage of two thousand men and women: "The free school of America: withered be the hand raised in sign of its destruction!"

Equally effective was his admonition to the Christian people of this country to "go forward, bearing in one hand the Bible, and in the other the Constitution of the United States!" So fierce is his condemnation of the liquor traffic that he has sometimes been styled "the Father Matthew of the Northwest," and he has even been known to refuse confession to dramsellers on the ground that they are feeding their bodies by destroying the souls of their brother men. He has also done everything possible to promote Irish immigration into Minnesota, procuring control of large tracts of farm land, cutting them up into homesteads grouped in colony fashion, and then assisting the poorest settlers in paying for their allotments and working their way upward by industry and thrift. In any enterprise of philanthropy or reform which enlists his services, he regards no distinctions of race, color, or creed, but mixes freely with his fellow citizens of all conditions, the only key to his sympathetic companionship being their sincere desire for better things.

But, naturally, the Archbishop has the defects of his virtues. He could no more keep out of politics than he could turn infidel. Once, in the early '90s, visiting New York to raise a loan on his individual property to clear his diocese of debt, he uttered his views publicly on the machinations of Tammany Hall and its congeners, and thus fell into a controversy with some of the local clergy. Again, in 1896, he came out vigorously against the Populistic ideas of Bryan, with their discrediting of the courts, their incitement of class antagonisms, and their attempt to foist a fifty-cent silver dollar upon business man and wage-earner alike. His candor was reported to Rome as a cause of scandal, and probably did him some damage there for a time, though later, in the settlement of the question of our Philippine friar lands, the Pope made considerable use of him as a go-between.

Personally, the Archbishop is a striking figure. He has a face of uncommon strength, keen yet responsive eyes, and the protruding nose and chin of a leader in forward movements. His presence, whether in plain dress or in his official vestments, inspires respect. He is, moreover, a man among men—genial, full of interest in whatever is afoot, fond of people, with a marked preference for informality of intercourse. He would be an ideal prelate to fulfil the prophetic picture suggested by a distinguished layman some years ago, of a Yankee Pope who should one day walk down Broadway, like any other modern apostle, in a frock coat and a high silk hat.

VIEILLARD.

Correspondence.

THE JUBILEE "NATION."

To the Editor of The Nation:

Sir: Allow me, even at this late date, to add my congratulations to the many that have reached you on the "golden" anniversary of the *Nation*, and with these congratulations an expression of appreciation of what the *Nation* has been to me these many, many years. My father must have been among the early subscribers, for I began to read the *Nation* as a boy, long before I could possibly understand it. Naturally, politics, because least intelligible to a boy's mind, proved the most attractive feature of the paper at that time, and as I write I recall heated discussions with my companions, all strong partisans, in which I used weapons drawn from the *Nation's* arsenal in favor of independent political thought that would no doubt have surprised Mr. Godkin and his associates.

This training in independent thought has been to my mind one of the most valuable among the many services rendered by the *Nation* to its readers, and through its readers to the country at large. Whether in politics, literature, science, or religion, in history or in current events, the *Nation* could always be depended upon to present a subject with due consideration of its various phases; and it could always afford to be fair towards honorable opponents, while merciless to those of whose sincerity or honesty it was in doubt.

The attitude of the *Nation* towards the various issues involved in the present most lamentable war, and towards the many problems aroused by the course of events, has been a test of the principles that have always guided your paper in its long career. To me and, I am sure, to many thousands the editorial expressions and the views set forth in the correspondence columns have been a vast help in clarifying one's own views and in aiding one to maintain that judicial attitude so essential at a time when feelings run high and when sympathies or prejudices are apt to cloud one's vision.

Morris Jastrow, jr.

Northeast Harbor, Me., August 4.

AS VIEWED BY A CHINESE STUDENT.

To the Editor of The Nation:

Sir: As a foreign student in America I have been greatly interested and sometimes amazed by the attitude the people of this country assume towards the European war and the parties involved. The sympathy and charity extended to the suffering masses of Europe, the serious and often idealistic tone of the press, the calmness and firmness of the statesmen—these cannot fail to impress any observer as evidences of a noble spirit that is in the Americans. But when one comes to examine the arguments for or against the several parties of the war, one can scarcely overlook the tint of prejudice. We hear today nothing but condemnations of German bureaucracy, German brutality, German violation of treaties and international law, German aspiration of dominating the world. But are you consistent in condemning the violation of Belgian neutrality and upholding the violation of Chinese neutrality? If Germany should not kill innocent passengers on the ocean, should the Allies starve innocent civilians on land? Germany is fighting a war of selfish nationalism; the Allies are fighting a war of altruistic internationalism. If they are, they surely can be expected to right the wrongs that Japan has so shamelessly inflicted upon China, to give the peoples of Korea, Persia, Egypt, India, and Poland a chance to work out their own problems. Will they?

These arguments and questions are all futile and bewildering. They are clear only in one respect—that might is right in the present world. We might as well put aside the mask, and tell each other coldly and frankly that nations are as yet unmoral internationally. The lesson for China, as well as for every other weak state, to draw from the European conflict is that her hope does not lie in the loving heart and lofty motive of the Powers, but in her ability to defend herself.

HUMANISTS AND HUMANITARIANS.

To the Editor of The Nation:

Sir: The logical confusion that underlies Mr. R. K. Hack's spirited attack in the *Nation* of August 19 on my distinction between the humanist and the humanitarian comes out most clearly, perhaps, in the following sentence: "Instead, therefore, of cursing democracy, muckrakers, and humanitarians, I propose that we curse nobody but our sinful selves." The whole point of my objection to muckrakers and humanitarians is that they would have us curse about everybody and everything except "our sinful selves"; that they would, in short, have us set up as "beautiful souls," instead of taking up the burden of moral responsibility. They have thus helped in no small measure to undermine spiritual discipline—which alone can curb the lust for power—and that at the very time when men have been acquiring a more and more thorough discipline in the use of material forces. Hence the emergence of that most sinister of all types, the efficient megalomaniac. If science has become a "wild Pallas of the brain," has forgotten that "she is the second, not the first," the error has arisen even less from a deliberate usurpation on the part of science than from the obscuring by emotional sophistries of the ethical law to which alone Science is rightly subordinate. What is monstrous in this age is not that it possesses mechanical efficiency, in itself an excellent thing, but that this mechanical efficiency has no sufficient counterpoise in spiritual efficiency. It would seem, therefore, that the first step in clearing up the present imbroglio is to call the humanitarians to a stern reckoning for the flabbiness they have encouraged on the human and spiritual levels of man's being; for having sought to discredit all traditional restraints, and failed at the same time to establish any new centre and principle of control; for having, on the contrary, belittled in a thousand ways intellect, insight, self-control, everything, in fact, in comparison with sympathy. Sultan Murad in Victor Hugo's poem of that name, after committing every imaginable crime of unrestraint, is pardoned at last by the Almighty because on one occasion he brushed away the flies from the wounds of a dying pig. An ass says Hugo elsewhere, that takes

a step aside to avoid treading on a toad, is "holler than Socrates and greater than Plato." By this overemphasis on sympathy the humanitarian shows that he has no sense of proportion, whereas the sense of proportion is the very essence and breath of life of humanism.

Pleas of the kind in which Mr. Hack indulges for the poetic faculty and spontaneity and the creative imagination have been poured forth in unparalleled volume during the past century; and yet the more these pleas have multiplied the more man has become the thrall of mechanism. This result points the way to some error of the first magnitude in dealing with the facts of human nature. The truth may be that man shows his own special spontaneity and the highest form of imaginative activity and at the same time escapes from mechanism, not by following impulse, but by resisting it. To let one's "feelings run in soft, luxurious flow" is, as Newman says, the exact reverse of spirituality. The opposite assumption is found in the entire modern movement, from its inception in the sentimentalists of the early eighteenth century down to the latest glorifications of instinct in philosophers like Bergson. The error is so grave, because it corrupts the very idea of duty; and men, as the French moralist has put it, must be either the slaves of duty or the slaves of force. In spite, therefore, of oceans of fine talk about liberty and democracy and service, the whole occidental world is now moving towards the triumph of force in some form or other, and will continue so to move until the underlying error is rectified.

According to Mr. Hack, what is implied in my assertions is that "human brotherhood is finally indistinguishable from tigrine association." Instead of asserting anything so preposterous, I have gone back to the earlier stages of the humanitarian movement, not as Mr. Hack supposes, that I might enjoy the pleasure of seeing battalions of abstractions march and counter-march, but, on the contrary, that I might escape from abstraction and show that, however beautiful in theory, sentimentalism is in practice akin not to brotherhood but to brutality.

May I add that it seems to me somewhat singular that a teacher of the classics like Mr. Hack, who is so plainly in earnest, would have us begin by considering the war from the situation as it existed only yesterday, instead of taking a long-range view—instead of building up a solid background of ideas and showing how these ideas have actually worked out in life and conduct? It seems to me at least equally singular that a classical teacher should seek to obscure the distinction between humanism and humanitarianism, on which the very survival of the classics as sources of substantial wisdom must ultimately depend—and what sensible person would care to see them survive on any other ground? I recently heard it remarked of our classical teachers that they have a genius for suicide. The best way for them to refute this charge is to show that they have a clear insight into the ultimate differences between a truly humanistic discipline and our modern humanitarian expansion.

Regarding the present mixture of efficient megalomania with humanitarian dreaming and the outcome. I wish to take this opportunity to quote a passage that has a prophetic flavor, by a writer of a very different school of thought from my own—the late Prof. W. G. Sumner, of Yale. In his essay on "War," first published in 1903, after commenting on the strangeness of the martial enthusiasm displayed in an industrial country like this during the conflict with Spain, he continues:

"At the same time, the social philosophy of the modern civilized world is saturated with humanitarianism and flabby sentimentalism. This humanitarianism is in literature; by it the reading public is led to suppose that the world is advancing along some line which they call 'progress' towards peace and brotherly love. Nothing could be more mistaken. We read of fist-law and constant war in the Middle Ages, and think that life must have been full of conflicts and bloodshed then; but modern warfare bears down on the whole population with a frightful weight through all the years of peace. Never, from the day of barbarism down to our own time, has every man in a society been a soldier until now; and the armaments of today are immensely more costly than ever before. There is only one limit possible to the war preparations of a modern European state; that is, the last man and the last dollar it can control. What will come of the mixture of sentimental social philosophy and warlike policy? There is only one thing rationally to be expected, and that is a frightful effusion of blood in revolution and war during the century now opening."

IRVING BABBITT.

Monadnock, N. H., August 26.

CHARLOTTE CUSHMAN.

To the Editor of The Nation:

SIR: In the series of Portraits of American Women, which I am now preparing for the *Atlantic Monthly*, I wish to include Charlotte Cushman. If any of your readers can refer me to persons owning any of her letters that would be of value for my purpose, I should be greatly obliged. GAMALIEL BRADFORD.

Wellesley Hills, Mass., August 23.

THE BODLEIAN LIBRARY.

To the Editor of The Nation:

SIR: The *Bodleian Quarterly Record* having now completed the first year of its history, it is possible to form an opinion of its value to librarians and book lovers. It was not to be expected that the conservative curators of the Bodleian would resort to any advertisement of their new publication; but the public has borne the loss in not knowing of its existence. The *Bodleian Quarterly Record* "is intended to be interesting and useful to readers in the Library, to Oxford residents, and to a wider circle." This wider circle must include many Americans who have enjoyed the hospitality of Bodley's Foundation, and many librarians who would gladly pay two shillings and four pence a year (to the Librarian, Bodleian Library, Oxford), for the information contained in this admirable account of the Library's activities.

Most valuable is the selected list of accessions for the preceding quarter, arranged in fifteen classes, and containing over 500 titles selected from forty times that number. This list should be of great use to book purchasers who may thus profit by skilled judgment before buying for their libraries. Each number also contains notes on literary and bibliographical matters and some hitherto unpublished material drawn from the vast treasures of the Library. A few selections will suggest the wide range of these notes. The total number of printed Incunabula is believed to be about 30,000; of these fifteenth-century books the British Museum has 11,500, the Bodleian 5,600, the Cambridge University Library 2,800, the John Rylands Library in Manchester 2,400. Of Baconian MSS. the Bodleian has 109, more than any other library. Lady Mary Shelley has added to the Shelley collection by presenting the poet's nursery rattle with bells, whistle, and red coral complete; while Captain Williams has given the original autograph copy of Shelley's "Epithalamium." It is pointed out that every edition of the Common Prayer Book of Psalms from 1553 to 1661 printed Ps. xxxvii: 29, "the *righteous* shall be punished," etc. The error was first made in the quarto Bible (Cranmer's, founded on the Great Bible) in 1553. "The punishment of the Righteous must have been proclaimed by hundreds of the clergy and by thousands of devout worshippers, during more than a century!"

Very interesting in one of the recent issues of the *Quarterly Record* are some Latin and Greek poems by Oxford men, devoted to praise of the Founder and the Library in 1613, and also Humphrey Wanley's suggestions, made in 1697, looking to improvements in the cataloguing and in the administration of the collection. Admirers of the late Prof. Ingram Bywater and of his works on Aristotle will be glad to know that his precious library was bequeathed to the Bodleian. If books are gifted with emotions, those in the Bywater collection have every cause of self-complacency; it was an honor to have received a place upon his shelves. There are more than 3,600 volumes in the collection, dealing chiefly with Aristotle, and nearly all printed before 1650. Many volumes bear *marginalia* by the great Continental scholars of the sixteenth and seventeenth centuries, and a copy of Melanchthon's "Commentatio de Anima" (1540) bears the rare autograph "Francisci Rabelesi καὶ τῶν αὐτοῦ φίλων." Nowhere could this collection have found a more appropriate resting-place than in this ancient centre of Aristotelian study.

There is no room for further reference to the literary notes. Old Bodleian readers will be glad to know, however, that, despite the lack of funds under which this greatest of University libraries is forced to labor, the money was forthcoming for a recent and most urgent addition to the stack accommodations. The ground between the Library and the Camera was excavated to the depth of sixteen feet, nearly to the water level, without disturbing the street or sod, and space was thus made for storing one million octavo volumes. There are two floors, of which the upper is installed with the most modern sliding steel bookcases. These slide upon upper tracks into the aisles with perfect ease, are entirely clear of the floor, and occupy two-thirds of the total floor-space. The system of electric lighting, heating, and ventilation is admirable. The Librarian is authority for the astounding statement that the total expense of excavation and interior construction work, excluding fixtures, was only £12,000. Each sliding bookcase costs £10, and holds 600 octavo volumes. To have created underground space for one million books at a cost of $60,000, is something of an accomplishment in economy. Moreover, it is gratifying to learn that, whatever physical drawbacks the Bodleian may have inherited

from the past, its stack can still be indefinitely enlarged by utilizing in the same way the ample space between the Camera and the University Church. The possibilities of underground stacks, when well protected from dampness, have perhaps never been better illustrated than here, where any surface disturbance would have been sacrilege.

W. W. COMFORT.

Oxford, June 30.

THE GAIETY OF SOCRATES.

TO THE EDITOR OF THE NATION:

SIR: I see many glowing tributes to the anniversary number of your incomparable paper, and I wish to add my congratulations, but I wish also to express my gratitude for the article "The Gaiety of Socrates." In the welter of discouraging and serious reading, it came as a real oasis—delightful in its wit and brilliant in humor. It is a real addition to one's treasure book. A. L. S.

Greenwich, Conn., July 30.

THE HARVARD ENGLISH PLAN.

TO THE EDITOR OF THE NATION:

SIR: Your editorial on the Harvard English plan, printed in your issue of April 22 (p. 431), and the comments elicited by it from J. M. H., in your issue of July 1 (p. 14), and from Professor Fore, in your issue of July 29 (p. 146), lead me to say that a plan similar to that recently adopted by Harvard has been in use in the University High School at Columbia, Mo., for some eight years. The University High School affords a practice school for those seniors in the University of Missouri who contemplate a degree from the College of Education. The supervisor of the English department in this High School had notebooks from the departments of mathematics, history, and the sciences delivered to his desk once a month. The contents were read from the point of view of clear, idiomatic English, as well as for spelling and punctuation—vital matters in a secondary school. The books were returned with brief but significant comments, and a note to the teacher in charge setting forth those issues most worthy of congratulation or criticism. A student's mark in English depended not less upon the character of his ability in English, as demonstrated in all other departments, than upon that work actually done for the English class.

This scheme had a most notable effect upon the general appearance, the style, and the content of all written work done by the students. It also had a tendency to render those college seniors who were doing their practice teaching exceedingly careful of their own written and spoken language. Students from this secondary school entered college with not a trace of that attitude which Professor Fore condemns as disgraceful; and the teachers from this practice school entered their profession feeling that "good writing is the business of every teacher." I quite agree with Professor Fore that the burden of teaching technical English rests primarily upon the teacher of English; but his burden need not be increased by the carelessness and the neglect of teachers in other departments. The problem of the secondary school is the problem of the college, intensified.

CAROLYN BENTON COCKEFAIR.

Warrensburg, Mo., August 2.

Book Notes and Byways

LUTHER S. LIVINGSTON: THE MAN AND HIS WORK.

By JOHN THOMAS LEE.

PART TWO.

In 1910 Mr. Livingston entered into a partnership with Mr. R. H. Dodd, under the name of Dodd & Livingston, and in 1911 visited London, where he formed many friendships—a thing for which he appears to have had a rare and happy gift—and, had not a lamentable accident befallen him on April 15, 1912, he would probably in due time have become one of the world's great book-sellers; for he was endowed as few men of his business have been.

Mrs. George D. Widener, whose son was lost in the Titanic (also on that fateful 15th of April), when Mr. Livingston's condition was sufficiently improved, asked him to become the first librarian of the Harry Elkins Widener collection in the Library of Harvard University. "He loved you, Mr. Livingston, and has talked to me so often of your knowledge and the help you were to him in advising him about books," wrote Mrs. Widener. And so the Corporation of Harvard University appointed him to the place on November 30, 1914, scarcely a month before he succumbed, after the bravest of fights. He lies buried at Mount Auburn under a beautiful pine tree.

III.

Mr. Livingston, in January, 1914, printed for private distribution "A Bibliographical Record," being, so the title continues, "A List of Books and Pamphlets, More or Less Bibliographical, Written, Compiled, Edited, or Containing a Preface or Other Contribution, by Luther S. Livingston." The "Record," as reprinted in the *Papers* of the Bibliographical Society of America (Vol. VIII), including a few titles added by Mrs. Livingston, contains sixty-six items. Thus it will be seen that he left a tidy legacy to bibliographical literature. It is true, of course, that some of the entries are of items of small importance, but the list contains many studies of permanent value and interest. All the items enumerated relate to books and manuscripts, with a single exception, "Chrysanthemums," printed anonymously in 1893, during his employment with Pitcher & Manda. The first volume of "American Book-Prices Current" (1895) was wholly the work of Mr. Livingston. The later issues of this useful series were largely compiled by assistants under his direction. Some of his best contributions to bibliography were issued in the form of catalogues by Dodd, Mead & Co., who made many notable collections, which were for the most part catalogued by Mr. Livingston in a way to leave little to be desired. He showed a decided interest in early historical Americana, writing prefatory "Notes" to facsimile reprints of "The First Four Voyages of Americus Vespucius" (German edition of 1509); "A Brief and True Report of the New Found Land of Virginia" (1588), by Thomas Hariot, the earliest original book in English on the region now within the limits of the United States; and John Brereton's "A Briefe and True Relation of the Discouerie of the North Part of Virginia" (1602).

One service to American scholarship is not included in the bibliography of Livingston's writings. Many of the rare books acquired by Mr. E. D. Church passed through our friend's hands; and Mr. Church asked him to make a catalogue of his magnificent collection. It was found, however, that he could not spare the time for so great an undertaking, and so, in 1901, the editorial task was assigned to Mr. George Watson Cole, a thoroughly competent scholar, and was completed in 1909. The Church "Catalogue" is a monument of erudition and bookmaking. Much of the preliminary work was done by Mr. Livingston, and it is said that the general plan of the catalogue, model for collations, descriptions, and notes were his, and he read all the proofs with the utmost care.

It is not surprising that Mr. Livingston's last days were cheered by the appearance of his "Franklin and His Press at Passy," published by the Grolier Club in 1914. The volume is before me as I write. It is a handsome octavo of 216 pages—a fine example of Bruce Rogers's art. It is unquestionably Mr. Livingston's best work, the ripe product of his learning and judgment. It is a captivating study of the numerous issues from Franklin's private press at Passy, where that many-sided man played the printer for his own amusement, and students and collectors of Franklliniana will be alive to the importance of Mr. Livingston's last and best book.

In 1898 he began his contributions to the *Bookman*, and it was here that I first encountered his work. Later he became a frequent writer for the *Nation*, whose readers will not soon forget his interesting manner of conveying dry bibliographical information.

He left many bibliographical notes and uncollected material, which Mrs. Livingston hopes to publish from time to time. Bibliophiles will be gratified to learn that it is proposed to reprint entire the "Bagatelles" described by Mr. Livingston in his "Franklin and His Press at Passy." Mrs. Livingston's position in the Widener Memorial Library will give her opportunity to carry forward some of the work her husband commenced so hopefully. At the time of his death there was in type one of the rare tracts which he planned to reprint, "Captain John Smith's Circular or Prospectus of His Generall Historie of Virginia." This has since been issued by Mrs. Livingston. It is a handsomely printed folio of five unnumbered leaves, limited to sixty copies. Smith's prospectus is a choice bit of Americana, and excessively rare; indeed, only one copy is known to have survived, and that is preserved in the collection of the Society of Antiquaries, in London. The tract is reproduced in excellent facsimile, and Mr. Livingston has added a valuable note of three pages.

Mr. Livingston was a bibliographer of wide range. During his long connection with the book trade very many rare and unusual items in all branches of literature passed through his hands. He was alert and not easily deceived, and he seems never to have missed an opportunity to add to his store of bibliographical knowledge from all available sources. On the whole, he was, I think, the peer of any book-seller of his day on this side of the Atlantic as an expert in matters of bibliography. There are those, no doubt, who surpassed him in a chosen department, but none, perhaps, had quite his versatility and competent grasp of the entire subject of rare books having an especial appeal for American collectors.

Literature

TWO BOOKS ON CONSUMPTION.

Consumption, What It Is and What to Do About It. By John B. Hawes, 2nd. Boston: Small, Maynard & Co. 50 cents net.

The Tuberculosis Nurse, Her Functions and Qualifications: A Handbook for Practical Workers in the Tuberculosis Campaign. By Ellen N. La Motte. Introduction by Louis Hamman, M.D. New York: G. P. Putnam's Sons. $1.50 net.

The first of these books (one of the Welfare series) is by an eminent physician, a specialist in tuberculosis who is also secretary of the Massachusetts Tuberculosis Commission, and the second by one who was formerly nurse-in-chief of the Tuberculosis Division of the Health Department of Baltimore. Utilizing not only their extensive experience of tuberculosis as a disease to be treated by physician and nurse, but also their knowledge concerning the disease as a human problem, Dr. Hawes has prepared a short treatise of one hundred pages intended to give the general public some definite knowledge of the subject in such a way as not to take the place of the physician, but to be of service to him, to the patient, and to the patient's family, while Miss La Motte has prepared a larger volume to fill the needs of nurses, social workers, anti-tuberculosis associations, and physicians and laymen engaged in public health work.

Dr. Hawes opens his discussion with several short chapters in which in simple, non-technical language he tells what consumption is, how the germ gets into the body, what the early and important symptoms are, what one should do when he *thinks* and when he *knows* he has tuberculosis. A brief summary of methods of home treatment is then given, and this is followed by a detailed description of How to Live and Sleep in the Open Air. Sanatorium treatment is discussed in detail, the advantages of various situations given, and, what is quite unusual in books of this character, the patient is told how to get to the various sanatoria, what it costs to stay at each, and what may be expected as the result of residence there. In connection with sanatorium treatment emphasis is laid on the one great advantage of such treatment—that aside from the possibility of cure or arrest of the disease, the patient learns *how to live so as to keep well after leaving the sanatorium.* Other chapters deal with tuberculosis in childhood, open-air schools, the marriage of consumptives, the use of drugs, and how to keep from giving consumption to others. The book closes with a chapter on Hints and Helps prepared by Dr. Charles L. Minor. Its tone is cheerful and hopeful, and the details as to the practical management and the financing of the tuberculous so valuable that it should become the *vade mecum* of those suffering from tuberculosis or responsible for the care of such.

Miss La Motte's book of about three hundred pages is based on her experience first as a visiting nurse to the tuberculous and later as organizer and director of the tuberculosis campaign in Baltimore. The material presented has, therefore, a local flavor, but as the problems discussed are common to all towns and cities, this does not limit the application of the ideas and principles set forth. Throughout her discussion, Miss La Motte emphasizes the importance of voluntary segregation as the chief factor in the eradication of tuberculosis—the removal of the distributer of the disease germ from an environment where he is dangerous to one where he is harmless. This she considers the chief and foremost duty of the public health nurse. This view is supported also by Dr. Hamman, who writes the introduction, and who especially emphasizes the isolation of advanced cases as the most important factor in limiting the dissemination of the disease. This and the development of an increased resistance to infection through improved personal hygiene and standards of living, are flatly stated to be of more importance to the community at large than the question of treatment. In short, the eradication of tuberculosis, though it is a problem of preventive medicine, is above all else a human social problem which concerns the community at large and is bound up with all social movements, as housing laws, child-labor laws, the wage question, municipal recreation centres, the liquor question, social service efforts, open-air schools, factory inspection, and so on. The question of early diagnosis and cure concerns the individual; the broader problem of eradication concerns the community. As Dr. Hawes's book discusses the problem from the point of view of the individual, so Miss La Motte, on the other hand, presents the problem from the point of view of what the community, the city, the State, should do.

In the earlier chapters Miss La Motte discusses the organization of a tuberculosis nursing service—the selection, training, and supervision of nurses, their compensation, duties, supplies, and reports. Then follow chapters on the relation of the visiting nurse to the practicing physician, the dispensary, the hospital, and the sanatorium, with a frank discussion of the advantages of co-operation with these various agencies and the reasons for failure and disappointment in such joint relations. Other chapters deal with the prevention of the disease, the inspection and disinfection of the houses, the care of the family, the problem of giving financial aid, and the question of occupation for the consumptive. A final chapter discusses the municipal control of the disease with special reference to the danger of political control and the influence of poverty. In the latter connection the statement is made that tuberculosis recruits 50 per cent. of its ranks from the very poor. When to this statement is added that of Dr. Hawes, that in the United States 200,000 people die annually of the disease, and Dr. Hamman's opinion that "ninety per cent. of the human race is tuberculosis infected, and that infection occurs at a very early age, so that at twelve years few children have escaped it," it is evident that tuberculosis is not merely a medical problem, but a human, social problem of the greatest importance. As Dr. Hawes says, "Compared with tuberculosis, the acute infectious diseases of childhood sink into insignificance, and even those much-dreaded diseases, smallpox, yellow fever, leprosy, and even cancer, do infinitely less harm and kill a vastly smaller number of people."

In combating this scourge the individual suffering from tuberculosis, as also those immediately responsible for his care and treatment, will find Dr. Hawes's book of the greatest value, while for societies, communities, and other agencies directing their efforts towards the broader problem of the control and eradication of the disease Miss La Motte's book will serve as both guide and stimulus.

CURRENT FICTION.

The Freelands. By John Galsworthy. New York: Charles Scribner's Sons.

Here is a tale by Galsworthy which, in its lack of connection with wars or rumors of wars, might have been written ten years ago. It is (happily) in the vein of "The Country House" and "The Patrician" rather than of "The Dark Flower." It presents once more little England, ante-bellum England, country-house and week-end England, "muddling through." This is an England not unaware of problems; there is an unpleasant minority which thrusts them upon it; but it has no real liking for them, with their habit of threatening the *status quo.* In this story the chief little problem involved is "the land," more particularly the question of what is to be done about the agricultural laborer, his limitations, needs, and defections. The opening scene, in which three brothers, gentlemen by blood, are indirectly brought together by the existence of this problem, gives a thumbnail view of the whole situation. Stanley Freeland is a manufacturer of ploughs for the colonial trade. John Freeland has an important place in the Home Office. Felix Freeland is a successful novelist. Each of them thinks the country in a bad way. Felix goes to the fraternal conference "conscious of a certain superiority in that he, at all events, had no hand in this paralysis which was creeping on the country." John lays the country's difficulties "partly to industrialism, with its rotting effect upon the physique; partly to this modern analytic Intellectualism, with its destructive and anarchic influence on morals." Stanley feels that the country is "eaten up with officialism . . . and the advanced ideas of these new writers and intellectuals, always talking about the rights and sufferings of the poor."

This note of overt satire is dominant throughout the book. There is another Freeland brother, "Tod," the crank or freak of the lot, a dreamer, or rather a dreamy lover,

of nature and simple living. He has married a woman of revolutionary temper; and their boy and girl have derived from her a rebellious attitude towards society. The "Tods" live secluded in the country; but at the moment when the story begins certain oppressive acts on the part of a neighboring landlord against two farm laborers have roused young Derek and his sister to assume the rôle of agitators. Their labor is wasted and worse than wasted. The death of one of the laborers is indirectly the outcome of poor Derek's activity, and as for the rest, the whole matter is summed up in a few lines of poignant dialogue at the end:

"Us can't afford to do no more dyin' for you—that's all," says old Gaunt.

"For me! Dying! My God! D'you think I wouldn't have——? Oh! Confound you!"

"Aye! Confounded us you 'ave! Hope you're satisfied."

Pale as death and quivering all over, Derek answered:

"So you think I've just been frying fish of my own?"

Tom Gaunt emitted a little laugh.

"I think you've fried no fish at all. That's what I think. And no one else does, neither, if you want to know—except poor Bob. You've fried his fish, sure enough."

Luckily for Derek, there is a maiden, daughter to Uncle Felix, who stands ready to comfort and support him—an old-fashioned maiden in whose arms we may be content to leave him, for his sake if not for hers.

The Nurse's Story. By Adele Bleneau. Indianapolis: The Bobbs-Merrill Co.

Miss Adele Bleneau has gathered together a timely supply of facts on the hospitals, the trenches, and general army conditions, and woven them together by means of a story. The weaving is not expert, and the story itself is singularly inept and spiritless. With her stage set as a battlefield, with a chromo of distant hospitals for her background, with modern carnage rampant, she has introduced the two antediluvian characters of fiction—the wounded hero of royal blood and the villain who springs forth suddenly from spiritual darkness and suffers reform in the next to the last chapter. In doing this, moreover, Miss Bleneau has been consistent: she has re-created her types without variation. There is even supplied the crisis where the villain, wounded, and sustained only by his own cunning, staggers to the cot of the dying hero and rips the bandages from the fatal wound. This is the beginning of noteworthy events. For just then the heroine returns and seizes upon the plotter to battle bravely with him. With this there arises confusion and still greater confusion; but at the end of it all despair alone remains triumphant, for the villain malignantly locks everybody up in the room, and with one sinister gesture tosses the key out of the window. At this critical moment the enemy begins to shell the building.

The Teutonic army proves a great convenience for Miss Bleneau. She moves it about from page to page of her novel like a mad chessman in some incredibly swift and futile game; and she even allows it, in one strenuous moment, to capture the heroine and bear her off to a prisoners' camp where the food is very bad. However, the heroine, faithful to type, steals through the enemy's lines, saves the life of the hero, combats shells and shrapnel, and returns at the supreme moment to reform the villain.

GERMAN INDUSTRIALISM.

Imperial Germany and the Industrial Revolution. By Thorstein Veblen. New York: The Macmillan Co. $1.50.

Readers acquainted with Professor Veblen's books on "The Leisure Class" and "The Instinct of Workmanship" will find the qualities of those stimulating works in his latest writing. The author is both economist and sociologist, and he is both at the same time; he does not pass from one field to the other, but makes the two fields one. An economic fact suggests to him a moral reflection, and a social institution is to him a problem in economic valuation. This attitude is a sufficient departure from the usual academic habit to give zest to all that he writes, and to make his work original and suggestive even when it is not conclusive. It is an attitude well adapted to a discussion of the topic in hand, which is an explanation of German industrial efficiency by reference to social facts and principles.

The author begins his study in the stone age of the Baltic peoples, but he confesses that his problem has to do with the recent rather than with the distant past, and his early chapters add little to the strength of his argument. Comparing the German with the English system, he is particularly impressed by the advantages which a people obtains by borrowing the technical arts rather than by developing them as a native growth. The English people, he thinks, made their industrial progress, in the period succeeding the reign of Elizabeth, at the expense of their old social and political institutions. The principles of self-help and equality of opportunity dissolved old authorities in law, government, and religion. Insubordination grew, and loyalty declined. The materialistic logic of business infected all English thought. The English industrial system, furthermore, developed in its growth a fringe of customs and conventions that were natural products of the time, but were actual hindrances to economic efficiency. Such were abuses in the competition of trade, leading to irregularities and loss, and breeding up a race of "depauperate" workmen, almost irremediably damaged in physique. Such were the canons of consumption, imposing "conspicuous waste" as the signal-mark of social propriety. Extravagance and useless or harmful sport became national institutions.

There were but the accidents of industrial progress in England, and from them the German people was spared while it was procuring political rehabilitation under the dynastic power of the Prussian state. The people retained habits of mind suited to the maintenance of a coercive, centralized, and irresponsible political control. They were confirmed in the frugal habits of a simple economic organization. Finally, when the time was ripe, still under the strict guidance of political authority, they assimilated rapidly the effective parts of the English industrial system, and took their place among the leading peoples, unique in their combination of qualities of the old time and the new. The "new technology brought with it virtually none of its inherent drawbacks, in the way of conventional waste, obsolescent usage, and equipment, or class animosities; and as it has been brought into full bearing within an unexampled short time, none of these drawbacks or handicaps have yet had time to grow to formidable dimensions. . . . Carrying over a traditional bias of Romantic loyalty, infused anew with a militant patriotism by several successful wars, and irritably conscious of national power in their new-found economic efficiency, the feudalistic spirit of the population has yet suffered little if any abatement from their brief experience as a modern industrial community."

The author ranges into all parts of national life in his endeavor to appreciate modern German "Kultur." As often as not he fails to command the assent of the cautious reader, but to his credit it must be said that his assertions are fair scientific hypotheses. His forecast, that the Imperial German state is "unable to get along without the machine industry, and also, in the long run, unable to get along with it," appears perfectly reasonable; and most American readers will agree with his conclusion that, whether the German state wins or loses in its present struggle, the cause of Western civilization will suffer from its activities.

LETTERS OF ROBERT E. LEE TO JEFFERSON DAVIS.

Lee's Dispatches: Unpublished Letters of Gen. Robert E. Lee, C. S. A., to Jefferson Davis and the War Department of the Confederate States of America. Edited, with an Introduction, by Douglas Southall Freeman. New York: G. P. Putnam's Sons. $3.75 net.

The originals of the more than two hundred letters and dispatches included in this volume appear to have been kept by Jefferson Davis among his private papers, and to have been lost at the time of the fall of Richmond. Where or how they were recovered we are not told, but eventually they passed into the private collection of Mr. Wymberley Jones De Renne, of Wormsloe, Georgia, with whose assistance they have now been printed. The papers cover the period from June 3, 1862, to April 1, 1865—from the time, that is, when Lee took command of the army defending Richmond until shortly before his surrender. With a few exceptions they are brief, but the editor

has supplied voluminous explanatory notes, and references, where necessary, to the "Official Records" or other works in which the subject-matter of the dispatch is also treated.

Only an elaborate review could point out and evaluate all the additions which these letters make to our knowledge of Lee's career. A few of the more important contributions are briefly summarized by Mr. Freeman in his introduction. For example, the second letter in the collection, dated June 5, 1862, outlines a plan by which Stonewall Jackson, then in the valley of Virginia, was to be strengthened by troops drawn from the Carolinas and Georgia, which would enable him to cross Maryland and invade Pennsylvania; while Richmond, whose defence in the event of siege would, Lee thought, require 100,000 men, "which perhaps would only prolong, not save it," was apparently to be abandoned if necessary to defeat McClellan's plan of "a battle of Posts." It would appear from this that the plan eventually adopted for the campaign from Mechanicsville to Harrison's Landing was an alternative rather than Lee's only choice. Again, from a letter of August 30, 1862, it seems that Lee regarded the second Manassas campaign as primarily defensive, intended to force the Federal troops across the Rappahannock in preparation for offensive operations later. Particularly interesting, also, though substantively less important, is the correspondence of the winter of 1864-65, in which the danger of starvation for the Confederate army, the urgent need of supplies of all sorts, and the necessity of keeping open railway communication with Richmond, are frequently mentioned.

One of the most notable letters, in human as well as military interest, is that of July 31, 1863, in which Lee takes upon himself the entire responsibility for the failure at Gettysburg. "No blame can be attached to the army," he wrote, "for its failure to accomplish what was projected by me, nor should it be censured for the unreasonable expectations of the public——I am alone to blame, in perhaps expecting too much of its prowess & valour. . . . I thought at the time that [a victory] was practicable. I still think if all things could have worked together it would have been accomplished. But with the knowledge I then had, & in the circumstances I was then placed, I do not know what better course I could have pursued. With my present knowledge, & could I have foreseen that the attack on the last day would have failed to drive the enemy from his position, I should certainly have tried some other course." Elsewhere in the letters appears the same admirable trait, his unwillingness to allow his subordinates to be blamed where he felt that he was responsible. On the other hand, Lee would not recommend promotion where, in his judgment, merit did not fully warrant it. In May, 1863, after the battle of Chancellorsville, he spoke of R. H. Anderson and Hood as "capital officers," who "will make good corps commanders, if necessary"; but in July, 1864, when Davis was planning to remove Joseph E. Johnston from command of the army before Atlanta, and substitute Hood, Lee, while commending Hood as a good fighter, and expressing "a high opinion of his gallantry, earnestness, & zeal," nevertheless declared that he had had "no opportunity of judging of his action, when the whole responsibility rested upon him"; and he indirectly recommended Hardee.

These letters should go far to set at rest the impression that there was friction and unfriendliness between Lee and Davis. Lee was too serious and devoted to dissemble, and without dissemblance he could hardly have written with the frank confidence which his letters show to an official superior whom at heart he distrusted or disliked. Differences of opinion there were, of course, but proof of any save cordial and friendly relations is in these pages wholly lacking.

THIS PUZZLING WORLD.

Boon: The Mind of the Race, The Wild Asses of the Devil, and The Last Trump. Being a First Selection from the Literary Remains of George Boon, Appropriate to the Times. Prepared for publication by Reginald Bliss, with an Ambiguous Introduction by H. G. Wells. New York: George H. Doran Co. $1.35 net.

Mr. Wells has permitted himself a good deal of sheer wit and not a little pure fooling. But we have always felt—as, despite their apologists, we have not felt about Messrs. Shaw, Chesterton, and the rest—that there was a basis of sound humor beneath his wildest extravagances. Our feeling about them, when the war broke out, was something like "Well, now these fellows will have to settle down." But we did not feel that about Mr. Wells; for if the time for flippancy and mountebanking was suddenly past, the time for true humor, for the humor that informs suffering and heals it, was ripe indeed.

Superficially, his present utterance bears the earmarks of the ante-bellum school of British jollity. The look of the title-page is odd. The publishers obligingly inform us that the contents make up "a literary salad with plenty of red peppers in it." There is a thinly mystifying Introduction, in which Mr. Wells goes casually through the motions of assuring the reader that the book is not his. It seems to him, he says, "an indiscreet, ill-advised book," and he does not wish to be identified with its author. "Bliss is Bliss and Wells is Wells. And Bliss can write all sorts of things that Wells could not do." Of course, the sense of this is that Bliss is stalking-horse for Wells's wit. The theory of the book is further complicated by the fact that the alleged Reginald Bliss is supposed to be acting chiefly as reporter of one George Boon, a popular novelist, who is privately a cynic philosopher. On its face, in short, the whole performance is one of those fantastic and whimsical divertisements with which the volatile Britain of the past decade has been wont to surprise us at intervals.

But it is more than this, for here, whether attributed to Boon or Bliss or Dodd or Wilkins, is assembled a humorous commentary upon the world of to-day. Upon the literary world in the foreground; for if there is a dominant idea in these pages it is that the hope of the race lies in its writing men, in "the great task of literature, the great task of becoming the thought and the expressed intention of the race, the task of taming violence, organizing the aimless, destroying terror. . . ." And this task is to lie not upon the shoulders of the few great writers. Boon has much fun with Greatness as a Victorian invention. "Never so little recognized Greatness," read his notes, "and never so much subtle, sweet, and boldly conceived literary work as now." . . . "Arnold Bennett as an aborted Great Man. Would have made a Great Victorian and had a crowd of satellite helpers. Now no one will ever treasure his old hats and pipes. . . ." As for the present world-muddle, Boon gives it up; his parables of "The Wild Asses of the Devil" and "The Last Trump" are the gropings of a broken-hearted man. But Bliss, the absurd Bliss, does not give it up, and here it is he rather than Boon who speaks for Mr. Wells. The war is horrible. "The black stream of consequence will flow for centuries. But all this multitudinous individual unhappiness is still compatible with a great progressive movement in the general mind. The tremendous present disaster of Europe may not be, after all, a disaster for mankind. . . . We must see these things from the standpoint of the Race Life, whose days are hundreds of years."

ORGANIZED CHARITY.

Social Work in London, 1869-1912. A History of the Charity Organization Society. By Helen Bosanquet. New York: E. P. Dutton & Co. $3 net.

Never probably has there existed an institution more bitterly criticised or more ineffectually, from its foundation to the present day, than the London Charity Organization Society. To those rich people who regard "charity" as a salve to their consciences, or, as the cynic has it, a form of fire-insurance, it has represented the unpleasantly candid friend; to the recipients of their doles it stands for "hatred, malice, and all uncharitableness"; to the professional charity-monger it has been a horrid nightmare. Yet never, probably, has a similar institution effected more within its chosen limits.

Commanded by religion; suggested by conscience and sentiment alike; acceptable to self-love, that aspect of charity which is best defined by the word "giving" has always been accepted as one of the most noble of human impulses. The handing of money to a starving beggar seems an act at once so grateful, so reasonable, and so virtuous that he who attempts to point out that it may actually be a form of wrong instead of well-

doing can scarcely hope for any prompt or widespread popularity. Accordingly, when the C. O. S. points out—as it has pointed out a score of times—that indiscriminate "charity" may be no more than a means towards pauperization, and that the only way to arrive at a cure for chronic poverty is to study its causes and their removal, it must accept the lot of the unpopular and trust to time to vindicate it.

An excellent example of this occurred in the winter of 1886, at a time of great distress in the East End. In response to numerous appeals and disregarding the protests of the C. O. S. and other students of the realities, such as Canon Barnett, the famous Warden of Toynbee, the Lord Mayor opened a Mansion House Fund for the relief of the Unemployed. Enormous sums were subscribed and poured in an ill-controlled flood into the poorer parts of London. Exactly what the C. O. S. had predicted resulted—as the Lord Mayor himself admitted some months later. Beggars, tramps, and other undesirables flocked in from all parts of the country; it was impossible to distribute the money with any attempt, even, at selection; the deserving were swamped in the serried ranks of the undeserving; mendicancy was again raised to the height of a profession, and East London suffered a degradation from which it took years to recover.

Originally designed to act as a clearing-house for all the reputable charitable societies, the C. O. S. very soon developed in the direction of a University of Social Study, especially, of course, in relation to poverty and its causes. A mere catalogue of its activities during its forty-five years of existence would make a formidable document. Housing and sanitation, the study of tuberculosis, hospitals, and their almoners, the care of and provision of food for underfed or mentally defective children, the causes of unemployment, the provision of pensions, sanatoria—in all of these directions, besides its better-known work in the regulation of charity and the suppression of bogus charities and professional mendicancy, the influence of the C. O. S. has everywhere made itself felt, and has in most cases offered a lead later to be followed by such public bodies as the London County Council, or even the Imperial Parliament.

In her careful study of these varied activities, Miss Bosanquet has produced a book of the greatest possible value to every student of social work. Although primarily devoted to London problems, it has a very direct bearing upon those, curiously parallel, which await solution in New York and every other great American city. That day may be long in coming when the public generally will be brought to realize that one of the most potent means of making poverty more poor is for the more fortunate to fling it doles out of their superfluity, and that the only way to work towards the millennium is to study the causes of human misery rather than the results. When that day comes the much-abused C. O. S. will find itself justified of all men.

Notes

The Macmiiian Co. will bring out this month a new voiume of Miss Sara Tea dale's poems, entitied "Rivers to the Sea."

A new volume by Arthur Christopher Benson, "Escape and Other Essays," is announced for immediate publication by the Century Co.

A new collection of Walt Mason's prose poems is published this week by A. C. McClurg & Co., under the title "Horse Sense."

The Bobbs-Merrill Co. announces the publication on Saturday week of George Bronson-Howard's novel, "God's Man."

Scribners bring out on Saturday "The High Priestess," a new novel by Robert Grant.

On September 11 Houghton Mifflin Co. will issue the following volumes: "The Valley Road," by Mary Hallock Foote; "Beigium's Agony," by Emile Verhaeren; "The Dot Circus," by Clifford L. Sherman; N. S. Shaler's "The Citizen"; "Red Wine of Roussillon," a drama in blank verse by William Lindsey; "The Arrow Maker," a piay by Mary Austin; "Oid Caiabria," by Norman Douglas; "The House of Friendship," by Agnes Edwards, and a new. enlarged edition of "The Roads toward Peace," by C. W. Eliot.

Among the "other addresses" by Viscount Haidane printed under the title of "The Conduct of Life" (Dutton; $1), of particular interest, in view of the many suggestions now bcing made towards a world federation, is the address delivered before the American Bar Association in Montreal in 1913 on "Higher Nationality." The most serious question in connection with a fedcration of nations is the basis of organization and authority. In reply Lord Haldane points to the Engiish iaw, and especially to the common law. The common law rests upon no articles of agreement; it is not even defined previously to being enforced. The common law is simply common moral sense become authoritative custom. Yet, to the wonder of most foreign observers, it has been proved to be an effective instrument of order. This suggests, according to Lord Haldane, that an international order may in the end be not less securely based upon the moral sense of nations.

Frances Delanoy Little, author of "Sketches in Poland" (Stokes; $2.50), is an Engiish painter, who aiso writes, and, judging from the specimens of her double activity, her palette serves her rather better than her inkweii. Shortiy before the outbreak of the present war, she traveiled in Galicia, Russian Poland, and Posen, and visited the churches and museum of Cracow, Lemberg, Danzig, and a few other towns. She also saw something of village life in the Tatra Mountains, but, above ail, she consorted with the Polish aristocracy—her pages bristle with princesses and counts. What she gathered from these informants possesses a certain value, as showing what miseries were inflicted upon patriotic Poles by the Governments of Russia and Prussia. Her chapters are very short, disjointed, and fragmentary. The best part of the book are the descriptions of the peasant costumes, seen with an artist's eye, and the account of her tribulations while painting in the presence of gaping country folk and the ever-watchful police. The author's sympathy with the Poles is in great measure offset by her heartless sneers at other elements of the population that do not happen to appeal to her fancy.

The report of the Library of Congress for 1914 is not so dull but that it contains two items of news which have attracted attention in Europe. One records the acquisition of the late Bertram Dobeli's collection of privately printed volumes, 1,611 in number, the fruits of years of searching in London, and many of them of great value. The other announces the purchase of the Mercy-Argenteau papers, consisting of more than ten thousand documents relating to the history of the family of that name between 1660 and 1880. It may be recalled that the letters of the Count Mercy-Argenteau contain the fullest descriptions extant of the French Court in the days of Marie Antoinette. The papers were offered for sale in New York in 1912 by an indigent member of the family, auctioned off for a song, because their polyglot character—they are in Greek, Latin, Spanish, German, Dutch, French, and Italian —concealed their value, and bought by the Library from a dealer. The British Museum and the Bibliothèque Nationale cannot but regard these additions to the Library with envy.

Prof. A. S. Mackenzie's "The Evolution of Literature," a grandiose survey, which takes the extraordinary position that the development of letters is closely connected with the development of society, and which traces literary composition on the five continents through the "primitive," the "barbaric," and the "autocratic" processes to its present happy "democratic" stage, has been reissued by Crowell in a cheaper edition ($1.50 net). The book is in its way provocative of thought—the laws of literary progress which it states, and in the formulation of which the author skims over vast expanses of traditional and written literature, are of that daring quality which must rouse any reader—and the new edition doubtless testifies to some general demand for this most unusual application of Spencerian theory. Its chief usefulness, however, will be found in its account of savage and semi-civilized modes of literary composition.

The more dramatic and sinister figures of Mirabeau, Danton, and Robespierre have found numerous biographers in Engiish and have rather eclipsed the noble-minded, patriotic youth of twenty-seven who came up from Dauphiné in 1789 to help establish in France a constitutional government. Barnave's feiiow townsman and devoted admirer, Bérenger, published a biography, with some of Barnave's papers, in 1843; but no one, not even any Frenchman, has made so exhaustive a study of the famous Dauphiné Deputy as E. D. Bradby in his admirable "Life of Barnave" (Oxford University Press; two volumes; $5.75 net). Mr. Bradby has been to Barnave's papers in the Archives Nationaies, to all the contemporary newspapers which reported the great debates in the Constituent Assembly and in the politicai ciubs, and to the mass of other material reiating to the eariy years of the French Revolution. He gives a just and convincing picture of Barnave's character—one of the most able, eloquent, genuine, and even

lovable figures among the members of the Constituent Assembly. Mr. Bradby is so devoted to Barnave that he gets a little impatient at times with his hero's enemies and detractors. He rails at the "lachrymose eloquence" and "suppressed snarls" of Robespierre; the fatuous conceit of "the busybody, Gouverneur Morris, the one-legged American statesman," who fondly imagined that he was guiding the Revolution because he gave advice which nobody took; and "the *Actes des Apôtres*, that famous paper of the aristocrat party, which enjoys an undeserved reputation for wit among those who have not read it, and a well-deserved reputation for obscenity among those who have." But he is no blind panegyrist. His biography of Barnave is really an excellent history of the Constituent Assembly so far as its work was influenced by Barnave. He has picked out the interesting details which give the proper setting for Barnave's great speeches and other activities as Deputy. To the "Flight to Varennes" he gives particular attention because Barnave was one of the three Deputies sent to escort captured royalty back to Paris. He sat in the berlin, wedged in on the seat between Louis XVI and Marie Antoinette, and was so courteous to them that the charge arose a little later that he had treacherous secret dealings with the Court. The charge was frequently repeated and became the pretext on which he was sent to the guillotine on November 29, 1793. It has also been often repeated and accepted by historians. But Mr. Bradby, after critically examining all the evidence, seems to establish conclusively that the charge was an unjust calumny born of political hatred and suspicion.

Helen Bosanquet's "The Family" (Macmillan; $2.25 net) is a reprint of a work which appeared first in 1906. The origin of the family, the purpose of the family, and the extent to which the purpose is being accomplished are as fundamental questions as those relating to the nature and purpose of electricity. Most persons give them about as much thought as they give the air we breathe. As the author of this work says, no one will feel himself at a loss in answering the question, "What is a family, and what is its purpose?" Man, woman, and child constitute the family, and the purpose of the combination is the mutual convenience and protection of all the members belonging to it. Nevertheless, in its just history, its present significance, and its importance for the future, the family involves a whole heaven and earth beside. In its simplest form it gives rise to no ambiguity and doubt. But in many of its aspects it is quite the reverse of simple, and here we find it susceptible of the widest divergences of interpretation. The justification of this reprint lies in the inexhaustible character of the theme, its vast importance in connection with modern political and social activities, and, not least of all, the sympathetic and conscientious treatment accorded it.

Under the rather unusual title of "The Orthocratic State" (Sturgis & Walton; $1) John Sherwin Crosby has embodied the results of an inquiry into "the unchanging principles of civics and government." The little volume contains a thoughtful statement of what its writer believes to be the underlying justification of all civilized rule, together with a survey and analysis of governmental functions, whether properly or improperly exercised. Mr. Crosby was prompted to write these chapters by the seeming need of meeting the Anarchists with their own forensic weapons, that is to say, by matching argument with argument rather than by entering a general denial or demurrer. He sets out to prove, accordingly, that the state is orthocratic, or endowed with an absolute right to be and to act so long and so long only as it does nothing which would be unjust to any human being if performed without civil authority. "That which would be harmful or unjust if done by an individual or a mob," he argues, "can be neither harmless nor just when done by the state." Having settled the basis of political obligation the author adds a chapter on Civic Problems, in which his conclusions on political theory are applied to the interpretation of present-day affairs. In the main, however, this portion of the book is an argument for such radical measures as public ownership of land, the abolition of all corporate privileges, and the adoption of a non-metallic or abstract basis for the national currency. The author writes with skill and sincerity. This will gain for his ideas a respectful hearing, even though his conclusions will not command any wide acceptance.

Not the least myopic of Mr. Bryan's recent ineptitudes is his proposal to discuss the question, "How may peace be restored?" wholly without reference to the question, "Who began the war?" If, as all the belligerents in some sense maintain, the great conflict was caused by a sudden but premeditated act of criminal aggression, the fact can hardly be without pertinency to the question, "How *ought* peace to be restored?" For it is not in the interest of the future security of Europe that acts of criminal aggression be proved by the event to be highly profitable to the nations engaging in them. It can be no good peace which rewards past disturbers of the peace. Books about the causes of the war, therefore, cannot yet be relegated to the category of ancient history; they touch very nearly the momentous practical issue of the future settlement. Among briefer books of this sort, that of J. Holland Rose ("The Origins of the War"; Putnam; $1 net) is, on the side of the political and diplomatic antecedents, one of the best documented and most readable. The volume—composed of lectures delivered at the University of Cambridge last autumn—shows, indeed, many signs of haste in composition; it is, for example, rather amazing to find a historian of Mr. Rose's quality citing "The Secrets of the German War Office," even though it be with the mild warning that "the statement is made without proof and is on several grounds suspicious." But in general the author makes a more discriminating use of the unusually wide range of material, especially of diplomatists' memoirs, in which he shows himself to be scarcely less at home than in the similar literature of the Napoleonic period; and his account, in particular, of Anglo-German diplomatic relations since 1875 is at several points exceptionally illuminating.

In his discussion of the social and economic causes of the war, Mr. Rose is much less competent. He embraces the theory, bathetically set forth by some German writers, that it is the "excessive pressure of population" that has driven Germany to arms. "The militant German of to-day is consciously or unconsciously harking back to the primitive times when the young Teutonic bloods persuaded the tribal meeting to let them lead forth a band of warriors to a land of plenty." At bottom the war is due to the determination of the German people not to "see the great majority of their emigrants forever lost to the Fatherland." This determination, in itself, Mr. Rose regards as a legitimate one; and he expresses the generous hope that the Germans may yet—not by conquest, but through "the fiat of mankind"—acquire, "if need be, parts of Asia Minor, Mesopotamia, and South Brazil," the Monroe Doctrine to the contrary notwithstanding. All this is more creditable to the author's magnanimity than to his learning. A slight use of ordinary works of reference would have acquainted Mr. Rose with the facts that for many years Germany has had no "excessive pressure of population," relatively to her resources and to the labor required for her industries; that German emigration has long since sunk to almost negligible proportions, amounting in 1912 only to some eighteen thousand persons; that immigration into Germany has meanwhile steadily increased, and has annually far exceeded the emigration; that for thirty years the Empire has possessed colonies in Africa and in the Pacific, extending over more than a million square miles, much of this territory being not unsuited to white habitation; and that at the outbreak of the war the German population of these colonies amounted to scarcely twenty thousand persons. Germany's craving for over-seas expansion has undoubtedly been one of the serious causes of international friction during the past quarter-century; but it has been in no degree the manifestation of a genuine economic or cultural need. And even if the facts had been otherwise, the action of German statesmen in 1914 would have been the strangest imaginable way of remedying a plethora of population. For among its most probable consequences were the loss of most of Germany's colonies, and the loss at the same time of the supposed surplus of population which was conceived to make colonies needful.

"The United States Federal Internal Tax History from 1861 to 1871," by Dr. H. E. Smith (Houghton Mifflin), is the Hart, Schaffner & Marx Prize Economic Essay of the year 1912. It is the conventional essay in fiscal history, but somewhat more thorough and painstaking than the average. Indeed, Dr. Smith seems to have left little, if anything, for others to do in writing the legislative history of the internal revenue system for his period. On the actual operation of the internal taxes the book is not so strong. It summarizes fairly well the evidence afforded by official documents, especially the reports by Mr. Wells, and utilizes some other materials; but does not attempt minute study of the history of the industries most affected by war taxation. Perhaps such work can be undertaken only by students of the history of particular industries, but it must be done by some one before a definitive history of internal taxes can be written. At some points Dr. Smith has neglected useful secondary materials. Thus (p. 2) upon the crisis of 1857 he refers to Hyndman's "Commercial Crises," and overlooks Dunbar's noteworthy essay. He overlooks, also, Dunbar's essay on the direct tax of 1861. Had he read it, he

might have modified the opinion expressed, at the end of the second chapter, concerning the utility of the constitutional grant of power to levy direct taxes. On page 163 Dr. Smith states that the stamp tax on mortgages "was $50 for every $500," and expresses the opinion that this rate was, "*perhaps*, excessive." Fortunately, however, Congress imposed no such rate, the tax on mortgages being, not $50, but 50 cents per $500.

In the early part of the seventeenth century the New England town meeting elected the schoolmaster. Then his election was turned over to the Selectmen, and ever since that time it has remained out of direct popular control. The Selectmen were succeeded in the exercise of this function by a "prudential committee," which easily led to our boards of education, which, in turn, sometimes delegate the power to a superintendent of schools. The present practice in detail as it exists in seventy-two of our cities is set forth in "The Appointment of Teachers in Cities," by Dr. Frank Washington Ballou, in the second volume of the Harvard Studies in Education (Harvard University Press). He finds that there is a well-defined tendency to increase the importance of the superintendent, but a wide diversity in the qualifications required of teachers. Only English grammar and American history are required uniformly in the five cities especially studied, twenty-nine other subjects being prescribed in one or more of them. At the close of his book Dr. Ballou presents a "constructive plan" for the appointment of teachers.

Among the mystics Ruysbroeck is an attractive and important figure. Although familiar with the writings of Meister Eckhart and his pupils Suso and Tauler, he shunned the excesses bred by the German school and reverted to the more sane and orderly mysticism of Latin Christianity. The latter variety is a kind of flowering of true Catholic doctrine, the former tends to a grotesque and ego-centric pantheism. In an interesting if rather exuberantly written little volume (Macmillan; $1) Evelyn Underhill, who has written other books on mysticism, gives an account of the life and works of Ruysbroeck, analyzes his modes of thought and practice, and concludes with an amateurish bibliographical note.

One had thought that the day of the simple-hearted narrative of European travel was gone forever. Father Michael Barrett, O.S.B., in "Rambles in Catholic Lands" (Benziger Brothers; $2 net), proves the contrary. Having completed a very pleasant little tour in Germany, Austria, and Italy, he sits down to give us his experiences, of which those remaining most forcibly in the reader's memory are such discoveries as that railway travelling is wearisome, but can be alleviated by the attentions of a polite guard; that the scent of lemon-blossom resembles that of orange-blossom, or that German beds are uncomfortable until you get used to them. He also describes a number of monasteries, which in themselves are interesting, but which are doubtless treated of, though perhaps less exhaustively, in the local guide-books.

To the Western mind, distracted by the spectacle of woman protruding from the "home" in various degrees, there is promise of repose in the opening pages of Elizabeth Cooper's "The Women of Egypt" (Stokes: $1.50 net). But we soon learn that even here the pure type is being modified; "the aristocracy can be seen driving in the afternoon within closed broughams." And a young man is capable of saying of his fiancée, "I will try to get her into a school or have teachers for her after we are married, if my mother will permit it."

The difficulty of finding a suitable book for a course for volunteer social workers has led to the compilation of "The Field of Social Service" (Boston: Small, Maynard; $1.50), edited by Philip Davis, who is the head worker in the Civic Service House, Boston. Beginning with a survey of the Background in Social Work, the volume describes in untechnical language the field for such activity, not laying special emphasis upon "charitable" work, and giving practical suggestions to persons who wish to have a part in such effort. To others the book will be of interest as an authoritative, readable account of social readjustments that are taking place and of the agencies that are more or less consciously bringing these about.

THE SILLIMAN LECTURES.

Problems of American Geology. By William North Rice, Frank D. Adams, Arthur P. Coleman, Charles D. Wolcott, Waldemar Lindgren, Frederick L. Ransome, and William D. Matthew. A series of lectures dealing with some of the problems of the Canadian Shield and of the Cordilleras, delivered at Yale University on the Silliman Foundation in December, 1913. New Haven: Yale University Press. $4 net.

This course of lectures was arranged at Yale as a memorial to James Dwight Dana on the centenary of his birth, and two great groups of problems in geology were selected as fitting subjects in view of Dana's interest in them. The first of these is the problem of the meaning of that most ancient land on earth, a land of granite wastes bordered by mighty lakes, the Laurentian Highlands of Canada. The second is the problem of the mountain foldings, volcanic rocks, and vast deserts of the Cordilleran mountain ranges from Alaska to Mexico, a field which, like the other, has been rapidly explored in great detail since Dana's time. It has yielded up stores of learning on the subjects of the ancient geography, evolution of animal life, and intrusion and extrusion of enormous bodies of volcanic melt, which makes the granite cores of the mountain ranges, and the country rock of innumerable mining districts, as well as the floods of lava and remnant hot places that are so conspicuous from the Yellowstone to the great volcanic peaks of California and the Cascade Range. For the exposition of present-day knowledge on these subjects a group of the most distinguished geologists of Canada and the United States was invited to lecture, and the summary statements of the several problems which they have presented in this volume compose a fitting memorial to the man who was the author of the greatest textbooks on mineralogy and geology of his time.

The contribution of Professor Rice, entitled "The Geology of James Dwight Dana," is an admirable and sympathetic revelation of the extraordinary range of Dana's learning and publications, and a tribute to his work and character as a man and a teacher. His two great, world-famous books were "The System of Mineralogy" and "The Manual of Geology." In addition he was no mean zoölogist, and described more than two hundred new species of coral animals and more than five hundred new species of crustacea. One of his admirable traits was his capacity for accepting new ideas and unhesitatingly abandoning old prejudices; thus he accepted evolution in the later editions of his book and completely changed his classification of minerals when it was found that chemistry and crystallography were the only sound bases for mineral system. He was the originator of the doctrine of permanence of continents. He wrote important books on coral islands and Hawaiian volcanoes, and the successive editions of his Manual kept pace with the growth of our knowledge of the glacial period in America, the difficult interpretations of the age of the ancient rocks of New England, and the mechanism of mountain-making in the Appalachians and in the Rocky Mountains.

If Professor Dana could return to us and read this book, probably the most distinctive characteristic of the progress of the last twenty years in American geology which would impress him is the brilliant and extraordinary work of Canadians. In his time, the work of Logan, Murray, and the Dawsons had already taken first rank in geological scholarship and brilliancy of generalization. But the great explorations of the West sent out by the American Government overshadowed them, and the names of Clarence King, Hayden, Wheeler, Gilbert, Dutton, Powell, and Dana himself were preëminent. But along with the marvellous growth of the Dominion of Canada in population, commerce, communication, and education, there has been developed a sturdy race of brilliant explorers and a marvellous development of mineral wealth. Three of the authors of this book are Canadian geologists, and the authors most cited in the index are Lawson and Daly, both Canadians, and both employed as American college professors. For many years there has been a friendly conflict waged between the American and Canadian schools of thought and terminology on the subject of the gneisses and schists of the Lake Superior region. Tomes as large as dictionaries have been published by American authors dealing mainly with the rocks originally called Laurentian and Huronian by Canadian authors. This book, published by an American university, is a complete triumph for the Canadian school; the classifications advocated are based upon the discovery by a Canadian, Lawson, of the most ancient fossils in the world, definite sponges of two species, and at least as old as the

Lower Huronian. Other Canadian geologists have identified the scratched pebbles and gigantic boulders of a still older glacial period; and the finding of limestones and carbonaceous deposits among the lowest beds that can definitely be considered sediments, leads to a division of the pre-Cambrian rocks into two groups, Archæozoic and Proterozoic, meaning the containers, respectively, of an ancient unknown life and of the first definite life. It is a far cry from the geological opinion of fifty years ago, when the so-called Silurian was the container of the first-known fossils, to that of the present day, which has added Ordovician, Cambrian, Proterozoic, and Archæozoic, and unhesitatingly believes that no sedimentary rocks exist remnant from a time when there was no life.

It should not be understood, however, that the several authors of this book agree in classification or in any theory concerning the ancient sedimentary rocks. Professor Adams, who writes on the very old gneisses of Canada, the granites, and the most ancient unconformities, does not believe in the term Archæozoic. The brilliant experimental work which Professor Adams has done in Montreal on the effects of high pressure on minerals, makes particularly interesting his conclusion that the hornblende schists may be produced (p. 69), (1) by the recrystallization of impure limestones; (2) by the alteration of basic igneous rocks; and (3) by the transfusion of limestones by granite fluids. He suggests as criteria for correlating formations that contain no fossils (p. 59), (1) tracing a formation directly; (2) similarity of mineral character; (3) relation to great revolutionary periods characterized by uprising, folding, and igneous phenomena. One cannot but regret that Dr. Adams has not separated in this list the times of surface volcanic action, such as the Keewatin and Keweenawan. The discussion of these periods and their volcanic activity would be illuminating, and the Keewatin is somewhat neglected in this book.

Professor Coleman appears to accept the terms Archæozoic and Proterozoic, and as his studies have been directed to the Sudbury Series, a great body of sediments and volcanic rocks shot through with Laurentian granite, he introduces this series as separated by a great discordance from the Keewatin and Grenville formations below, and (with the Laurentian) similarly separated from the Lower Huronian above. Although their differences of interpretation are not pointed out as such, the tabulations of succession given respectively by Adams and Coleman differ very greatly. Adams considers the Laurentian gneisses to be at the base of everything, as well as partly invading later formations in igneous fashion. Coleman definitely places the Grenville limestones and schists as the oldest known rocks, making the Laurentian granites much later intrusions, in which, however, the sediments "are cradled as if the magma had lifted them bodily." The fossils discovered by Lawson near Atikokan, one hundred miles west of Lake Superior, were considered by Lawson as Archæozoic, or about the age of Keewatin or Grenville. Coleman considers them much later, the fresh appearance of the limestone resembling typical Huronian. An amusing evidence of how doctors differ appears in the philosophical interpretations of the pre-Cambrian presented in different parts of the book by Professor Coleman as authority on Proterozoic formations, and Dr. Wolcott, a world authority, on the Cambrian. Coleman writes: "It may be that the earth in pre-Cambrian times was not yet clothed with land plants, and that life existed only in the water" (p. 156); his chronological table (p. 160) of pre-Cambrian events shows at least five marine invasions. Wolcott, on the other hand, using the term Algonkian for all pre-Cambrian sediments, considers that probably (p. 203) "all the known rocks of Algonkian time are of non-marine origin, and hence could not have imbedded a marine fauna."

The Keweenawan, a volcanic time next before the beginning of the Cambrian, injected the whole Canadian Shield with dikes of diabase estimated as possibly surpassing in bulk all the many cubic miles of outpoured lavas known in the Keweenawan formation (p. 157). These eruptions brought with them copper, nickel, silver, cobalt, gold, platinum, and palladium, and, excepting iron, almost all the metals in the rich mines of Canada resulted from the Keweenawan eruptions, no ore deposits of importance being known to have formed there later, "its floods of molten magma seem to have exhausted the treasure-house" (p. 160).

Dr. Wolcott's discussion of the Cambrian and its problems brings up to date the many discoveries, largely by himself and his colleagues, which have been made in North and South America and in Asia during the intervals since he wrote his famous paper on "North America in Cambrian Time." The most striking items in this paper are the résumé of pre-Cambrian fossils discovered (p. 202), and the discussion of the great Upper Cambrian invasion of marine waters. While the early Cambrian trangressions by the sea of the North American continent were due to localized down-warpings of the land, it appears that at the beginning of Upper Cambrian time the whole continent across the Mississippi basin was flooded from the Pacific side so as to connect through from Lower California to the Arctic Ocean. At the same time, Eastern Asia and South America were flooded with mediterranean seas, "which leads to the conclusion that it was a movement of the ocean level rather than a movement of the continents" (p. 139).

Coming to the igneous geology of the Cordilleras, Professor Lindgren shows that the most striking phenomenon is the great chain of Jurassic-Cretaceous batholiths from California to Alaska, the largest single unit, and "probably the greatest single intrusive mass known" on earth, being the body extending north of the international boundary from Vancouver to the Yukon for 1,100 miles, with a greatest width of 120 miles. This body is largely quartz diorite. This series of intrusions ranges in age from Middle Jurassic to early Tertiary, and "the intrusions seem to have begun on the west side by irruption of basic magma" and thence extended eastward, becoming more granitic. In the late Cretaceous and early Eocene the monzonite stocks and laccoliths appear in Idaho, Montana, and in general through the Rocky Mountains, while Miocene and Pliocene times were characterized by the maximum of volcanic activity, mostly surface flows constituting in the aggregate the greatest lava areas of the world; eleven greater volcanic areas are distinguished, from the Mexican Plateau to the Aleutian Islands. The succession of Tertiary lavas varies in different places, the most common arrangement indicating that rhyolite was first erupted, the series closing with the outpouring of basalts. Mr. Lindgren keeps an open mind on the subject of differentiation of igneous magma. He believes that in general the outer earth is in layers with the basaltic zone deeper than the more acid zones. Concerning the differentiation of lavas into rhyolite, andesite, and basalt, he writes: "The circumstantial evidence of differentiation is strong, but with all our discussions, nobody has yet proved the exact *modus operandi*." He believes in the stoping and "blowpiping" hypothesis of Lane and Daly, but he is not ready to grant that this passive rising of magma by detaching blocks from its roof is the dominant mechanism. He insists that everywhere uplift and intrusion go hand in hand, that wherever a roof is visible, doming is observed, and that undoubtedly uplift was a consequence of batholithic intrusion.

Dr. Ransome's chapter is an exhaustive classification of the Cordilleran mountain ranges. He lays stress on the Basin Range district of Nevada, being an area of collapse rather than of uplift. The post-Laramie revolution is accounted for by supposing that, during Cretaceous time, the Cordilleran land mass was rising and being eroded, the rising mass tending to spread eastward towards the sediments of the Laramie trough, and, finally, the uplifting forces were relaxed enough to permit thrusting stresses to accumulate on the border. The land mass was thrust forward against the eastern sediments, crumpling and overthrusting them. This revolution "would be followed by collapse and down-sinking of the imperfectly supported Cretaceous continent and by normal faulting behind the overthrusts."

Most readers will find Dr. Matthew's article on the problem of the Tertiary sediments the most fascinating and absorbing story in this intensely interesting book. The great accumulations of red, yellow, and brown silts that make the picturesque buttes and badlands of the West have yielded a store of fossil bones, and the older thought which considered them lake beds has been completely replaced by a knowledge that they are mostly river wash, volcanic ash, and wind-blown dust which trapped the bones of animals that lived upon the land. The lake theory had a great vogue, but it is now

dismissed, "true lake deposits playing but a minor part" (p. 398).

As for the record of fossils, if we assume that in Tertiary time the fauna and flora were as large and varied in any one epoch as they are to-day, then there must have been about 300 genera and 1,500 species of land animals living at any one time.

During the Tertiary period there was a slow change in climate from warm and humid all over the world to the present cold polar climates and large arid deserts. Examining a chart of the world on a North Polar projection, we see a great circumpolar land mass, with Australia, Africa, and South America extending southward from it as peninsulas. The story of the distribution of monkeys, carnivora, horses, sloths, and other mammals in successive ages indicates a dispersal southward from this polar continent. The sequences tabulated, particularly that of the horse, show how strikingly the evolutional series are being filled out by modern science. The evolution of Tertiary mammals is traced "in an ever-increasing diversity of structure and adaptation, in an ever-increasing dominance of the fauna of the open plains, of arid regions, and of cold climates." "And through all the adaptive divergencies, we see a steady, continuous improvement in the size and quality of the brain, . . . raising the mammals continually higher above the semi-automatic and instinctive life of the lower animals."

The following word-picture of the possible forefathers of mankind is vivid:

> I am more disposed to think of these, our distant ancestors, at the dawn of the Tertiary, as a sort of hybrid between a lemur and a mongoose, rather catholic in their tastes, living among and partly in the trees, with sharp nose, bright eyes, and a shrewd little brain behind them, looking out, if you will, from a perch among the branches, upon a world which was to be singularly kind to them and their descendants. . . . A kindly providence . . . had just removed from their path the huge and horrific dinosaurs which had terrorized the world for so many ages.

Only the birds, equally quick and active, might dispute the mastery of the world, but these were studying aerial navigation and left the mammals to rule over the land, "only reserving to themselves a few coaling stations, as it were, among the trees, and elsewhere on the land and picking up any unappropriated islands of the ocean where the mammals had not made good their territorial claims by occupation and settlement" (p. 440).

The summarized analysis of the evolution of modern mammals is to the effect that the placental orders date back to the late Cretaceous, the families to the early Tertiary, the genera to the late Tertiary, and modern species rarely date earlier than the Pleistocene or Glacial period, while the most highly specialized and dominant families, genera, and species are those of more recent origin. Such generalizations, drawn without bias from many groups of animals, show that there is nothing remarkable in the fact that the genus homo is geologically of recent date.

Drama

"YOUNG AMERICA."

A timely subject is worked out along solid, if conventional, lines in Mr. Fred Ballard's "Young America," which had its opening performance in New York at the Astor Theatre on Saturday evening. It was inevitable that a dramatist, casting about for an engrossing theme of the present day, should sooner or later choose the relation of children to the law, as it is seen especially in the juvenile court. The underlying proposition that even waifs will respond to kindness is of course not new, but the spirited courtroom scene, which makes up the entire second act, at least gives an appearance of freshness to this latest treatment. Mr. Ballard has indeed shown wisdom in confining novelty to setting and appurtenances. Of the latter he has been perhaps too prodigal. Besides a vacuum cleaner which can be used in a pinch to rid one's clothes of flour hurled in small bags by naughty children, there are two trained dogs, one of which at a certain juncture lays claim to being the protagonist, and a Plymouth Rock "rooster." But the real test is revealed in the fact that the characters themselves hold the audience's interest pretty steadily.

The problem of the play centres in Art Simpson, a young orphan who, at the request of his dying mother, has been looked after by his aunt, a washerwoman. But Mrs. McGuire has tired of the task, and, having children of her own, has wasted precious little sympathy on him. The result is that the boy has twice been brought before the Juvenile Court, and now, after a third offence—stealing chickens—awaits commitment to a reformatory. The court scene has been led up to by an act in which is assembled a group of suburbanites—some of them characters of capital interest, among them the Dorays, newly married, whose hen roost the boy has attempted to rob, and Billy Coombs, an amusing grumbler with a good heart. It is Mrs. Doray's sympathy for the wayward boy, fostered by a wise judge, which in the end makes a man of him, and, after strong scenes of uproarious comedy, broadens and softens the outlook of her husband and that of Coombs.

In spite of the fact that this play gets its effect in large measure from the surprises of situation, there is some firm character-drawing. The boy (Percy Helton), who loves his dog Jasper enough to steal for him, and who has no other friend but Nutty Beemer—a gamin admirably represented by Benny Sweeney—is made a bit too emotional in the climaxes, but otherwise is an excellent example of a child become sullen by being forced in upon himself. To the part of Mrs. Doray, who in the author's hands is nothing more than a sweet, sympathetic woman, Peggy Wood has added no little subtlety. Hers was a happy bit of acting. The rôle of Jack Doray, a man looking for domestic peace and finding himself, through his wife's intervention, saddled with the bringing up of a supposedly vicious orphan and his dog, is, of course, spectacular rather than difficult, and requires no comment. But a word should be said for the solid work of Forrest Robinson as Judge and of William Sampson as the cynic, Coombs. As played, both parts partook of the soundness usually to be found only in the old-time stock company.

We have allowed considerable space to a play which is after all only fair in all-round execution, because its author gives promise of better things. Other young playwrights might profitably follow his lead, to the extent at least of concentrating their attention upon representative human character, instead of attempting to solve any world-problem which happens to be to the fore. F.

The difference between Christian theory and Christian practice is the theme of John Galsworthy's play, "A Bit o' Love" (Scribner; 60 cents). When it was acted in London some time ago the piece met with a cool reception from the public and the critics. This is not surprising, for it has some manifest imperfections as drama, and offers little that would be likely to appeal to the great mass of theatre-goers. Nevertheless, it exhibits many of the qualities to be expected in any work of Mr. Galsworthy, such as a genuine realism enriched by imagination, a definite purpose, and sterling literary skill. The bitter wrong of it is too subtle to be apprehended of the multitude. Logically, the story should have closed in tragedy. The allegorical ending, if pretty, poetic, and sentimental, is also dramatically feeble and conventional. Michael Strangway, an ideal Chrisitian priest, patterned after the model of Francis D'Assisi, has been deserted by his newly wedded wife, to whom he is passionately devoted. She returns to tell him that she has rejoined an earlier lover, on whom her future happiness depends, and to implore him not to begin the divorce proceedings which must ruin them both. After a cruel struggle with despairing passion and anger, he convinces himself that revenge is no part of the divine love, and bids her go in peace. But the interview has been overheard, and presently he finds himself the jest of the parish. His rector's wife rebukes him for conduct subversive of the Faith and the Church, while the villagers deride him as a coward, and hiss him as he leaves the pulpit. In his agony he meditates suicide, and is about to hang himself in a barn when the prattle of a child and the coincidence of a feather wafted to him on a moonbeam revive his energies and hope, and he starts for fresh scenes to begin the battle of life anew.

The inherent dramatic defects of such a tale are obvious, in spite of the simplicity, sincerity, and power with which Mr. Galsworthy tells it. Nice problems of moral conduct, religious belief, and social law cannot be settled arbitrarily upon the merits of a very special and somewhat improbable instance. The judgment of enthusiasts is apt to be led astray by their zeal, and Mr. Galsworthy is not exempt from this liability. It is by no means certain that a woman in Mrs. Strangway's position might not live to regret that divorce had not enabled her to establish legal claims upon her lover. Mr. Strangway's benevolence, in the final issue, might prove the reverse of beneficial. Freedom is not the only question involved in free love. The dramatist unquestionably would have made his play more effective if he had permitted his hero to die, and so presented the by no means inconceivable spectacle of a good man done to death for daring to live up to the spirit of the faith that was in him. But the chief virtue of "A Bit o' Love"—an infelicitous title—resides

not in the story but in the dialogue, which reproduces the atmosphere of the prescribed locality, the Southwest of England, with notable fidelity. The manner in which frequent satirical meaning, of which the supposed speaker is often unconscious, is expressed in the simplest and most natural phraseology, is particularly skilful. There is delightful sense of rural character, of mental processes as well as of speech, in the scene showing a meeting in the village public-house. Both humor and utterance are redolent of the soil. Admirable, too, is the talk of the children, really childlike, but not merely childish. Strangway himself is a fine type of spiritualized humanity, neither maudlin nor sanctimonious, a saintly man. The rector's wife is a vital and womanly sketch. It is a delightful play for the library, with little to commend it to the commercial stage.

"The State Forbids" (Mitchell Kennerley), by Sara Cowan, is a little thesis play of decided but misdirected ability—written to prove that the state which makes it illegal for doctors to destroy idiotic children at birth, on the ground that all life is sacred, is utterly unjustified in destroying healthful life by enforcing conscription in time of war. Of course there is no real relationship between the two propositions. Authors of thesis plays seldom take the trouble to look far beyond the particular instance with which they are dealing. It is not difficult, one would imagine, to foresee some of the manifold abuses which might occur if the question of life or death for infants was left in the hands of irresponsible physicians. In the case of conscription life is endangered only (not taken) in order to save other lives and liberty. The public would not be any the worse off if a good many silly and mischievous plays were snuffed out before making their way into the world, but the state unluckily respects their right of existence.

Finance

THE GREAT FALL IN STERLING EXCHANGE.

The complete demoralization in exchange on London, this week, has superseded all other topics of financial discussion. The break from last week's high rate of 4.66½ to 4.62½ on Saturday and to 4.55½ last Tuesday (31 cents under the normal parity) brought dealing in international exchange to an absolute standstill. For perhaps the first time, it caused apprehension in the markets over the heavy additional cost involved to European purchasers of our merchandise by the premium which they must pay in English money to lay down the price in American money at New York. The notion that this might curtail England's purchase of our merchandise was urgently discussed on Wall Street, as was also the more familiar notion that selling of our securities by London would be stimulated because of the advantage in turning dollar values into pounds sterling. Both on the Stock Exchange and in the wheat market the present week's movement of prices was visibly influenced by this imagined sequel to the collapse of exchange rates.

These apprehensions are probably much exaggerated. Necessarily, this great depreciation in the purchasing power of the English pound on a market where England buys supplies will enhance the price of all such commodities to the English consumer. In that respect, it operates almost precisely like actual depreciation of a currency through abandonment of the gold standard. The abnormal fall in sterling exchange, however, is not limited to our own among the great producing markets. Greater or less depreciation, in one of these markets as against another, might lead to temporary shifting of such orders. But in the main, Great Britain is buying in our own market what it has to buy.

In the face of last week's 4-cent drop in sterling at New York, this country's merchandise exports for that week, as shown by the Government's statement this week, rose $10,000,000 over the week preceding, making the third largest weekly export movement of the year. As for the stimulus to selling of our securities by English holders, the patent fact is that such sales have actually slackened, during this latest violent break in exchange. Either the English investor argues that, by keeping his securities, he can get the bonus on his interest and dividends as well as he could get it on his principal by selling, or else he is, on the whole, content to leave his money in the securities of a country to whose economic prestige the exchange market is giving such eloquent testimony.

The really grave aspect of this sensational fall in exchange is not its effect on trade or on investments, but its inevitable bearing on the prestige and credit of London. It is frequently remarked that sterling at New York fell nearly to present figures during 1873, and below them in 1857. But those cases were not analogous. The decline was in each case momentary, was followed by recovery to normal rates, and was caused, not at all by England's necessities, but by the prostration of the New York money market in the face of panic, which made it impossible for holders of drafts on London to get cash for them, except at a heavy sacrifice. To match existing conditions in exchange, one would almost certainly have to go back to the rate on London at the great continental cities in the Napoleonic wars. But London can ill afford such loss of prestige now, in view of its admitted surrender, considered by Lombard Street only temporary, of its position as the world's money centre. It is probably not yet too late to remedy the situation through scientific use, on a very large scale, of English credit in New York. But the problem has been fumbled with at least six months too long, and each successive day makes its solution harder.

On the side of the United States the episode in the sterling market is most interesting. A few days ago $19,500,000 gold arrived in one consignment at New York from London. This followed a long succession of smaller shipments, which have borne witness to the new situation in this country. Nobody will have forgotten that, a year ago last month, the one thing on which our whole financial community seemed to agree was that if our Stock Exchange should reopen, Europe would draw away all the gold of the United States. It was commonly believed that Europe held $5,000,000,000 of American securities, and that our markets were also heavily in debt to London on current account. The American stocks and bonds, it was taken for granted, would all be sold back to us. How could we pay for them, except in gold?

As a matter of fact, this country actually did export $104,000,000 gold in the first four months of war-time, even with our stock exchanges closed to European liquidation. But since January 1, the outside world has sent more than $180,000,000 gold to the United States—an amount more than double the largest previous import for any corresponding period, and matched only twice in any full calendar year of the country's history. Meantime the complete report by the United States Mint, published a week ago, showed that this country's own gold production during 1914 was $94,500,000, larger by $6,200,000 than the year before.

At the monthly average thus indicated, $63,000,000 gold has been added from this source alone, since January 1, to the country's stock. The Government's "money circulation statement" showed that even on August 1 the gold in the United States was greater by $190,000,000 than on January 1, and greater by $119,000,000 than on August 1, 1914, when the war broke out. And gold is still pouring in at spasmodic intervals from Europe; nobody ventures to predict how much more will come before the year is over.

Will this extraordinary movement mean, as many bankers have predicted, that the wildest carnival of speculation in our history is about to break out? This is always a possible supposition. There is another possible theory, however—that this immense increase in reserve money means that the country is being equipped with the tangible resources wherewith to take up in earnest its new and possibly epoch-making task as the present money centre of the world.

New one volume edition, revised

Morals in Evolution

By L. T. HOBHOUSE

650 pages, 8vo. $3.25 net.

First published in two volumes in 1907, this work took its place as a standard authority and one written with unusual clarity and interest.

The first edition was shortly exhausted, but the author desired a thorough revision before reprinting; meantime the book has been out of print.

This moderate priced edition is practically a new book.

The Nation At Leading Book Stores

THE NATION is on sale at leading book stores and newsstands throughout the United States and Canada. Our readers will confer a favor by reporting to us any newsstand or book store at which they are unable to obtain copies of THE NATION. If you desire to secure a copy regularly through the newsdealer, during temporary sojourn at any place, it is a good plan to give him a regular order. List of dealers in a number of cities where THE NATION may be obtained is as follows:

Ann Arbor, Mich., H. Stofflet.
Atlanta, Ga., Miller's Book Store.
Baltimore, Md., Newsstand, Hotel Belvedere.
Beloit, Wis., E. A. Nelson.
Buffalo, N. Y., Iroquois Hotel Newsstand.
Chicago, Ill., A. C. McClurg & Co.
Chicago, Ill., A. Kroch.
Cleveland, O., Pushaw Stand in Superior Arcade.
Decatur, Ill., W. T. McFadden.
Galesburg, Ill., G. A. Sweuson.
Hartford, Conn., H. P. Kopplemau.
Milwaukee, Wis., T. S. Gray Co., 104 Wisconsin St.
Ithaca, N. Y., D. Mayers.
Madison, Wis., The College Book Store.
Minneapolis, Century Newsstand, 10 S. 3rd.
Montreal, Chapman's Book Store.
New Orleans, La., C. E. Staub.
New Orleans, La., G. E. Hill.
Newport, R. I., W. P. Clarke Co.
Philadelphia, Pa., C. B. Swift, Bullitt Bldg.; L. G. Rau, 7th and Chestnut Streets; Greene Hotel, 8th and Chestnut Streets.

The
Manassas Industrial School
OF
Manassas, Virginia

A LITTLE school on the battle field of Bull Run founded by a colored woman some twenty years ago. It is doing invaluable work among the young colored people of Northern Virginia in giving them skilled training in many trades, and fitting them for intelligent citizenship.

The school has the endorsement of the Miner Board, the Slater Fund, the General Education Board and the Phelps-Stokes Fund, and its influence on the community life in that section is marked. It is largely supported by annual contributions, but its income from this source is insufficient. Your help to increase this income will be appreciated.

Contributions, large or small, are gratefully received, and may be sent to

Miss M. R. WALTER
Post Office Box 794
20 Vesey St.
NEW YORK CITY

☞ Checks should be drawn payable to the order of The Manassas Industrial School.

The Nation

NEW YORK, THURSDAY, SEPTEMBER 9, 1915.

Summary of the News

Hopes of a satisfactory adjustment of the submarine issue between the United States and Germany were raised high by the publication on September 1 of an official communication addressed by Ambassador Bernstorff to Secretary of State Lansing. The German Ambassador's statement, evoked by the controversy over the sinking of the Arabic, contained the following passage: "Liners will not be sunk by our submarines without warning, and without safety of the lives of non-combatants, provided that the liners do not try to escape or offer resistance." Count von Bernstorff added that the policy of the German Government as outlined in his statement had been decided upon prior to the sinking of the Arabic. Secretary Lansing, on behalf of the Administration, contented himself with a brief, formal expression of satisfaction with the Ambassador's communication. By the daily press the statement was generally hailed as presaging a complete settlement of the issue with Germany.

Apparently rejoicings were premature. Three days after the publication of Ambassador Bernstorff's statement, on the evening of September 4, the Allan Line steamship Hesperian, with three hundred and fifty passengers and a crew of three hundred aboard, bound from Liverpool to Montreal, was torpedoed off the Irish coast. According to all information attainable as we write, there is little room for doubt that the explosion which destroyed the vessel was caused, not by a mine, but by a torpedo from a German submarine. All accounts also agree that the attack was made without warning. Early reports asserted that a 4.7 inch rifle was mounted in the bows of the vessel, but doubt as to the truth of these reports has been expressed by officers of the line, and, as we write, the matter remains in doubt. In any case, it is pointed out that the carrying of guns on merchant vessels for purposes of defence is permissible by international law and by the laws of the United States. The Hesperian did not immediately sink, but efforts to tow her into Queenstown failed, the ship foundering thirty-four hours after she was hit. The majority of the passengers and crew were landed safely at Queenstown, those now reported missing numbering twenty-six. The only Americans aboard were three members of the crew.

After the lull in activity which we noted last week, German submarines have returned with zest to the attack. In addition to the liner which, according to Count von Bernstorff, was to have been exempt, seventeen vessels have been reported torpedoed since we wrote last, fourteen British, one Norwegian, one Swedish, and one Danish. Rumors which have come of late from so many sources as to demand credence, that the submarine campaign has proved exceedingly costly to Germany, were in a measure confirmed by the publication in the New York *Times* of September 4 of information contained in a personal letter written by Sir John French to the effect that up to three weeks ago forty-two German submarines had been sunk or captured by the Allies. In the Dardanelles four Turkish transports were reported sunk last week by a British submarine. The sinking of a British transport was also reported from German sources, but the report lacks confirmation and may refer to the loss of the Royal Edward last month.

The difficult situation existing between this country and the Teutonic allies can hardly be said to have been improved by the admission of Dr. Dumba, the Austro-Hungarian Ambassador, that he has engaged in various activities calculated to prejudice a legitimate American industry. The revelation of the Austrian Ambassador's enterprise came through the detention by the British authorities at Falmouth last week of James J. Archibald, an American newspaper correspondent, who was carrying dispatches from Dr. Dumba to Foreign Minister Burian, at Vienna. In these dispatches, it is asserted, was evidence that the Ambassador was engaged on a scheme for crippling by means of strikes the industry in munitions in this country. The following passage is quoted from the correspondence: "We can disorganize and hold up for months, if not entirely prevent, the manufacture of munitions in Bethlehem and the Middle West, which, in the opinion of the German Military Attaché, is of great importance and amply outweighs the expenditure of the money involved." The Ambassador issued an explanatory statement, published in Monday's papers, which, by the press at least, has not generally been accepted as satisfactory. He had an interview on the subject with Secretary Lansing on Tuesday, the result of which has not, as we write, been made public.

The situation in the Balkans remains delicately balanced. Reports last week indicated that Servia was at last prepared to meet the wishes of the Allies in the way of territoral concessions to Bulgaria, only insisting that she retain direct means of communication with Greece. The Greek Parliament, after an all-night session, adjourned on September 5 until October 28, without any statement in regard to foreign policy having been made by Premier Venizelos.

According to the Overseas News Agency, by wireless to Sayville on September 1, the Russian losses in the eastern campaign since May 2 have been 300,000 in killed and wounded and 1,100,000 prisoners.

On September 2 Cardinal Gibbons had an interview with the President, in the course of which it is safe only to say that the European situation and the prospects of peace were discussed. The Cardinal, it is understood, was the bearer of some kind of message from the Pope to President Wilson, but it was expressly denied by the Vatican on September 4 that the Pope sent any special message to the President, by which it may presumably be inferred that the communication, whatever its nature, was oral and informal. It is expected that a statement in regard to the interview will be made public shortly.

President Wilson caused to be made public on September 2 the text of the letters he wrote under date of July 21 to the Secretaries of War and the Navy in regard to formulating a programme of national defence.

Instructions were sent to Ambassador Page on September 3 directing him to press for an immediate answer to inquiries recently addressed by Washington to the British Foreign Office in regard to the method to be adopted to obtain the release of American-owned goods of German origin, valued at more than $150,000,000, which are at present delayed at Rotterdam. An official statement by the State Department on the general situation was published in the papers of September 4.

Dispatches from Berlin of September 4 stated that there was every indication that the subscription to the new German war loan would be highly successful.

The situation in Mexico can hardly be said to have improved. Trouble of a somewhat serious nature has developed on the Texas border as a result of the firing by Mexicans on American troops and of raids across the line. A skirmish, in which one American trooper was wounded and several Mexicans were killed, took place on Saturday of last week, and American troops are massed on the border to repel any renewed attempt at invasion. From dispatches from Washington on Tuesday there appears to be some suspicion that the recent raids have had the support of Carranza, a considerable body of whose forces is said to be concentrated on the Mexican side of the border.

Rear-Admiral William B. Caperton, commanding the American forces in Hayti and Haytian waters, issued a formal proclamation on September 3, declaring martial law in Port au Prince and the immediate territory occupied by the forces under his command. The text of the proclamation was published in the papers of September 5.

According to a dispatch by the Associated Press under date of September 6, "to obviate the necessity of again obtaining the recognition of foreign nations" the Chinese Government "has decided tentatively to maintain the form of a republic instead of restoring a monarchy, but to make the Presidency permanent and hereditary." This information, it was stated, came from "high official quarters."

The New York State Constitutional Convention adjourned on September 4, after having passed thirty-three articles and amendments to the State Constitution. Adjournment was taken until this (Thursday) evening, when the delegates to the Convention are to return for twenty-four hours in order to pass formally upon the State Constitution, as amended, in readiness for its submission to a vote of the people on November 2.

The Week

No error could be more serious than that of looking upon the great achievement of American diplomacy recorded in Count Bernstorff's note to Secretary Lansing as a victory on a mere punctilio, a satisfaction like that of the duellist upon a "point of honor." The principle for which we were contending, though it happened to be embodied in a form which, in the concrete, might be made to appear as of trifling character, was a principle than which nothing could be more vital. The carrying on of commerce upon the high seas—even commerce in contraband—without peril to the lives either of crew or of passengers, is one of the few privileges of international intercourse in time of war which have been held intact and unchallenged for generations. In setting at naught this simple and unmistakable principle, Germany justly earned the title of "an outlaw nation"; and it was to vindicate and reëstablish the law of nations in a vital point that we interposed our veto. The crime of the Lusitania massacre did not consist in the fact that there were Americans among the murdered; but it was owing to that fact that we had specific ground for intervening on our own account—intervening without making ourselves the judges of other nations in their relation to one another. Had the matter, however, concerned merely the slight advantages or opportunities immediately at risk for Americans, we could not have nerved ourselves to the point of insisting on our rights at the peril of the bare possibility of war with a nation with which ours desired to be at peace. Our case was impregnable in law and justice; but what made it great and momentous was that it was in principle the case of international right, the case of civilized warfare against unshackled terrorism—in a word, the case of civilization itself.

The gravity of the latest allegations of Austro-German activity in attempting to hamper the manufacture of munitions in this country is hardly lessened by Ambassador Dumba's explanation. His statement, in the first place, is inadequate. Accused of having written that "we can disorganize and hold up for months, if not entirely prevent, the manufacture of munitions in Bethlehem and the Middle West," he explains that he merely wished to induce many blindly laboring Austro-Germans in American munitions industries to throw down their tools. Did the Ambassador really think that to do this would dislocate and perhaps entirely stop the export of war materials from the regions named? The editor of an Hungarian newspaper remarks that the stoppage of work by every laborer of Austro-Hungarian blood in the land could not have had such an effect, as these men would be easily replaced by those of other nationalities. If Dr. Dumba wrote what is alleged, he should have realized that many would think him under suspicion of having planned more far-reaching steps to attain so great an end. He cannot too soon establish the fact that it was an unexceptionable moral propaganda he had under contemplation. If he appealed to the individual Austro-German through his newspapers or other organs of information, well and good. Any one may sympathize with his desire to make such men see the wrong they were doing their native land. But he must make it plain that he intended countenancing no recourse to paid agitators who would work on masses of men through labor leaders, often against the wishes of individuals. An effort to call out laborers in an organized way, by the use of money paid to men who had somehow gained influence over them, and under cover of questions foreign to the manufacture of munitions against the Central Powers, would be at once an interference with our civil order and our neutrality. Dr. Dumba ought to realize that there have been reports of such veiled and illegal activities, and that he lies under strong suspicion of being connected with them.

In short, while Dr. Dumba qualifies his plan as "a very open and direct method," its openness seems to have waited on the British search of his confidential agent's papers, and doubts are cast on its propriety by even the slight details he has given. He wished to carry on an educational campaign to withdraw his countrymen from a work the purpose of which they did not understand. Why did he not make a suitable announcement of the undertaking, whose hazy outline he now tries to rob of its suspicious appearance? He planned, he says, a labor bureau to obtain employment for his nationals when they had abandoned their work. In certain lights and to a certain extent this was proper enough; but the mobilization of Austro-German labor as a distinct body in this country can easily be carried too far. The sensitive state of our diplomatic relations with Germany and Austria-Hungary makes it imperative that Ambassador Dumba do his share towards clearing up the matter at once.

Some of the comments of the German press upon Count Bernstorff's guarantees to the United States have an unpleasant sound. The British writers who discounted German assurances and declared that the submarine warfare would undergo only the narrowest, most technical modifications, we thought sourly illiberal. They might now plead the utterances of the *Vossische Zeitung* and the *Tägliche Rundschau* in justification of their suspicions. If these journals had the direction of German naval policy, reparation for the Lusitania outrage would be unthought of. The sinking of the Arabic, pending the report of a submarine that will probably never come in, would be declared thoroughly justifiable. According to the *Vossische Zeitung*, ordinary merchant ships will not be spared in any circumstances, and any passenger ship that can be imagined to be manœuvring against a submarine will receive the shortest shrift. The *Tägliche Rundschau* thinks the relaxation of the submarine campaign a serious offset to the victories in the east. With views of this nature having currency in Germany, the Imperial Government ought to see the internal necessity for defining its position more unmistakably.

"There is small consolation in the events of the last few days," said our dear friend Herman Ridder, in his *Staats-Zeitung* last Thursday morning, "for those who were so eager to rush this country into war with Germany over the Lusitania and Arabic incidents." Well, that may be true enough; only we don't know of any considerable group either of individuals or of newspapers who were "eager to rush the country into war with Germany." On the other hand, we do know of a considerable group of newspapers, professing to represent a vast body of citizens of German nativity or descent, that is left by "the events of the last few days" in a position that is so ridiculous that any talk of "consolation" for them is simply out of the question. One may think of consolation for a man who has made a tragic blunder, even if it was a wicked one; but for a comic blunder there can be nothing but laughter. Where does von Bernstorff's announcement leave our super-Teutons of the German-American press, who thought the Lusitania and Arabic performances a mere matter of course, and protests against them an American impertinence? They didn't *quite* say this, of course, especially in the first shock of universal indignation over the Lusitania slaughter; but they soon drifted into a position so near to this as hardly to be distinguishable from it. And now they

are left high and dry, with only von Tirpitz for company. It is a funny sight for Americans.

The overshadowing importance of Germany's change of heart in the matter of the submarines has entirely crowded into the background the latest "revelations" concerning Belgian diplomacy published by the *Norddeutsche Allgemeine Zeitung*. The German press has devoted much space to the subject, and while most of the leading papers think that the alleged evidences of British duplicity, manifested so long before the outbreak of the war, throw more or less light on the causes that led up to it, not one paper of any standing, so far as we know, pretends to believe that these "proofs" prove very much. A few short months ago the tone of the discussion concerning the subject would have been very different. Now, so able and important a paper as the Bremen *Weser-Zeitung*—one of the ablest in all Germany—speaks of the value of the Belgian documents with considerable restraint. The sum and substance of its remarks is: Germany cannot afford to disregard anything that sets her right in the eyes of the world, and every little bit helps. But what we wish to point out as really significant in the *Weser-Zeitung's* article is the admission that "it cannot be denied that Germany went into the war with a confession of guilt" ("Wir sind einmal mit einem Schuldbekenntnis in den Krieg gegangen"). To be sure, this refers to Bethmann-Hollweg's confession as to the violation of Belgian territory, but when German newspapers once begin to confess any guilt at all, there is no telling where they may stop.

No one is surprised that Washington remains calm in the midst of the fusillade of rumors about exchanges of shots across the Rio Grande; the gratifying element in this latest development is the continued calmness of the American public. But why this world of difference between our state of mind—or feeling—towards Mexico and the hair-trigger attitude we took towards Spain the best part of two decades ago? One reason is doubtless to be found in the different atmosphere at Washington. Nobody in the Cabinet now is talking as if a conflict were inevitable—and Congress is not in session. But a larger cause may lie in the view we hold of Mexico. If that unhappy country were a great Power, between whom and ourselves old rivalries, economic or political, or both, had created animosity that could be heated at any moment into irritation, then we might easily be having such a situation as would promptly have arisen between France and Germany at any time these fifty years as the result of corresponding rumors. Our cartoonists have correctly summed up the reality. Uncle Sam is annoyed rather than angry, because he realizes that his duty is double, being not merely the protection of his family against a neighbor's dog, but also such service as he can render the neighbor in putting restraint upon the animal.

Why panic should ever befall the inhabitants of this country is incomprehensible in the light of a single morning's headlines:

Daniels Planning for Huge Navy to Be Afloat by 1918.
American Solves Our Dye Problem.
Blues Win a Hill in Big Sham Battle.

If it is true that in three years we can build twenty-one battleships, twenty-two cruisers, several hundred destroyers and submarines, accomplishing in three-quarters of a Presidential term what the British or German navies would probably require half a dozen years to accomplish; and if it is true that the mastery of the dye industry, which Germany has been building up for fifty years, has been won by an American, and that production will begin "within about two weeks"; and if it is true that the Blues at Plattsburgh, consisting largely of business men fresh from the padded office chair, are wreaking havoc among the ranks of the United States regulars who make up the invading Red army, then it is plain that, no matter what national emergency presents itself, we can solve it anywhere from three times to three hundred times as fast as any other nation. Then why panic? Or can it be that the optimism of the headlines is to be taken just about as seriously as the panicky fear of the headlines? We imagine that President Wilson neither builds 200 warships in three years, nor yet sees German troops landing on Long Island early in 1916, but that somewhere between the extremes of foolish panic and foolish cock-crowing he searches for the truth.

When any one of our consular or commercial agents finds himself short of matter for a letter to the Department of Commerce, he puts on his hat, goes down the street, stops at any shop or office where he has not stopped on a similar errand recently, and primes himself to listen to a fresh tale of American stupidity. The latest such story happens to come from Panama. In May, there was a fire in Colon that burned out many business houses. A few weeks later one of the largest of these firms received by the same mail—thus dramatically was the scene staged—two letters, one from England, the other from New York. The letter from England showed none of the contempt for "natives" that forms an important ingredient of the British reputation, but on the contrary inquired solicitously about the effect of the fire, noted the additional burdens created for business in England by the war, and wound up with this practical expression of sympathy: "Give yourself no occasion for worry at the state of your account. We know how conditions are. Send on your orders, and they will be filled as usual and upon the usual credit terms." The New York letter began: "Owing to war conditions, we are compelled to curtail our lines of credit, and the terms in future will be——" If this were an isolated instance, it might be passed over; indeed, a commercial agent would know better than to report it. But it appears to be in keeping with the rule.

No indictment of Government wastefulness could be more emphatic than would be the approval by Congress of the proposal to abandon the partially completed improvements of the Missouri and Arkansas Rivers. Though it is the Board of Army Engineers which has reported them generally unsound, it is to be remembered that the projects involve so many considerations beyond those of an engineering nature that the Board is by no means a final authority. For years Congress has debated the desirability of carrying on by annual appropriations large rivers and harbors improvements, and has usually given the benefit of the doubt to those in charge of the pork-barrel. By virtue of the bill of last year, the Board not only has the direction of $20,000,000 to be spent immediately, but is authorized to report upon the desirability of continuing improvements already under contract, for which an additional $7,000,000 was appropriated under the Sundry Civil act. Its attitude of hostility promises a more critical examination of these projects in Washington this autumn than they have ever received. Whereas Middle Western interests have long maintained that steamboating would yet see a revival, and deep channels on the tributaries of the Mississippi be justified, there has always been a feeling that an impartial examination might condemn these improvements. The projects which have been or are being reëxamined by the Board call for an ultimate appropriation of $75,000,000, and there is talk of

cutting off one-half. Every dollar saved of this, as of the lump appropriation for integral improvements, will be testimony to the wisdom of Senator Burton's plan for the employment of the expert army board.

What has become of the famous Republican team-play? Here is Theodore E. Burton, back from a Western trip, full of rosy visions of Republican success in 1916. Not an ordinary success, which the party might conceivably be content with after four years out in the cold, but a landslide. Victory, victory everywhere, is the burden of Burton's slogan. Let no one say that the ex-Senator is influenced in his forecast by the idea, popularly attributed to him, that it is about time for another President named Theodore. He merely reports in cold blood what his eyes have seen. But so does Gov. Gates, of rock-ribbed Republican Vermont. "If present conditions prevail in 1916," he confesses, "America will support the Administration." To see two Republicans divided like this is sad enough, but the melancholy spectacle is made worse by a third Republican, who adds his voice to the wrong side. Nobody has hitherto questioned the party devotion of Senator Sherman, of Illinois, who is also a candidate for the Republican nomination, but his praise of the President might at least be qualified by a hint that while Wilson is all right for 1915, it behooves the people to take a better man in 1916.

That steps may be taken simultaneously to simplify two important industrial problems is indicated by reports of a conference last week between the Government's dye expert and representatives of the Du Pont and General Chemical Companies. Both are manufacturers of chemical materials which are bases at once for explosives and for dyestuffs. Whereas the market for explosives is certain to witness a sudden collapse at the end of the war, the most earnest efforts are now being made to discover sources from which the bases for dyes can be permanently supplied to a strong domestic industry; and entrance into the field will permit those now turning out benzol, toluol, and naphthalene for Europe to preserve the hastily built plants that might otherwise have to be scrapped. Such a resource is probably but one of a number which the Government, if it meets a proper response from the industrial world, will be able to help develop. Want of coördination among several industries, and especially, those using the by-products of coke, with a failure to pay sufficient attention to modern methods and the work of the chemical expert, has been at the root of our dependence on Germany for dyes. There has been no lack of raw materials, and the Department of Commerce has firm ground for its confidence in the possibility of building up a stable native dye manufacture without such artificial aids as a tariff increase.

California is pluming herself upon the prosperity of the Panama-Pacific Exposition, its $1,200,000 of "mortgage indebtedness" having been paid off some weeks ago. Beside the St. Louis and Chicago fairs, the fiscal conduct of the Exposition has clearly been a shining success. Indeed, it has given a lesson to European managers. Some of the great exhibitions on the Continent have been almost disastrous, that of Vienna in 1873 having left a deficit of nearly $8,000,000, and that at Paris in 1900 having failed in spite of national and municipal gifts and the issue of admission tickets with numbers for lottery drawings attached. But the accounting of expositions is by no means standardized, and much of San Francisco's advantage may be only apparent. It has not yet paid back the appropriation of $5,000,000 authorized by the State or the equal amount given by the city; while the private citizens who subscribed $7,500,000 in capital stock are not likely to get it all back. The Exposition is now enjoying its most crowded season, and the total of admissions does not seem likely to surpass that of over 27,500,000 at Chicago.

The grand jury which has been sitting at Marietta, Ga., has at least succeeded in indicting all Cobb County. Given a community of the knavishly indifferent, to paraphrase Carlyle, how could zeal for justice be evolved from their united official action? Though succeeding grand juries are authorized to resume investigation if fresh evidence appears, Cobb County has in effect served notice on the country that the great majority of her citizens so approve of the lynching of Leo Frank that they are willing to let the crime sink into history unpunished. What is the country to do about it? This ending of the affair makes it plain that the one thing that can be done by better sentiment, North and South, is to push forward an educational campaign which shall revolutionize the entire attitude of communities like northern Georgia towards these anti-legal proceedings. The nation-wide interest aroused by the Frank case should make the time peculiarly propitious for a crusade against mob outbreaks, on a more organized plan than ever before.

Berlin's official estimate of the Russian losses since May 1 as 1,100,000 prisoners and 300,000 killed and wounded will raise the question how thoroughly the official German figures for prisoners must be accepted. During the entire conduct of the war it has been a fairly safe rule to accept official statements in dealing with the facts of victory and defeat, as true. It may be different when it comes to numbers. There are observers who have all along questioned the German figures for Russian prisoners. Hilaire Belloc in his review of the first year of the war squarely refuses to believe. He charges that Berlin has a way of duplicating captures and of including large numbers of civilians. Thus, writing in the early days of August, when by Berlin accounts the Russian prisoners in Galicia were nearly 700,000, Mr. Belloc places the number at 200,000. On the other hand, he estimates the Russian losses in killed and wounded at a million, whereas Berlin's estimate for a period longer by a month places them at only 300,000. If the truth lies somewhere between the two estimates, we believe that it lies much nearer Berlin's figures than Mr. Belloc's. Allowing for duplications and civilian prisoners, the Russian prisoners since the beginning of the great drive in May should come close to a million.

Berlin's figures are interesting in the light they throw on the probable total losses of Russia since the beginning of hostilities. These losses have been exaggerated. When one reads of nearly two million prisoners, the natural tendency is to allow for a proportionate loss in killed and wounded, and so obtain an enormous total. But it has been pointed out that if the Russian troops are captured with ease the casualties must be much smaller than in the obstinate fighting on the western front. This is confirmed by Berlin's estimate of 1,100,000 prisoners and 300,000 dead and wounded, in spite of the fact, as Berlin says, that the Russians saved their artillery "by recklessly sacrificing their infantry." Altogether, by Berlin's figures, Russia has lost about two million prisoners, and this ratio would give a total of only 600,000 casualties, or a total loss of 2,600,000. Allow for the savage fighting in the Carpathians and around Lodz and before Warsaw last winter, and it is still probable that Russia's total losses are less than 3,000,000 men, or not much above Germany's.

THE HESPERIAN.

The sinking of the Hesperian has suddenly cast a cloud over the situation. That the cloud may be soon, and completely, dispelled is the earnest hope of the American people. The genuineness of their satisfaction over the clearing up of our dispute with Germany, so plainly promised by Count Bernstorff's note of a few days ago, was manifest. One reason for expecting that the sinking of the Hesperian will not prove to be the undoing of all this is the almost unthinkable outrageousness of the act, if it is an outrage at all. It is true that the Lusitania outrage also seemed unthinkable before it happened; but there is a vital difference. So far from Germany having promised at that time to respect the laws of war in her treatment of peaceful ships, she had expressly notified the world that she would set those laws at naught; the reason for confidence that the Lusitania was safe was that the world could not believe that Germany would carry the lawlessness and barbarism she had foreshadowed to their furthest possible limits. She herself, however, was in a position to say that she had done no more than she had threatened. But Count Bernstorff's note was a withdrawal of that threat, and an explicit promise of abstention from any repetition of the crime. If, therefore, the Hesperian was torpedoed without warning and without cause given by herself, Germany would be guilty of an immediate and shameless violation of a solemn written promise upon which the ink was hardly dry, made to a great neutral nation which had shown its sincere desire for a continuance of friendly relations with her. Until the facts have been brought out more thoroughly than is the case as yet, it is reasonable to suppose that an explanation will be forthcoming which will restore the conditions in which, during the past few days, we have been taking such keen satisfaction.

But, while it is sincerely to be hoped and expected that this latest disaster to an Atlantic liner will be accounted for in such a manner as to permit of the continuance of progress towards a complete settlement of the issue between this country and Germany, there is one result which ought unquestionably to follow from the occurrence. It is a sharp reminder of the incompleteness of the understanding that has thus far been arrived at. The brief note addressed by Ambassador Bernstorff to Secretary Lansing was in itself by no means free from doubt as to its interpretation, and moreover it did not profess to give more than a mere fragment of the communication which the Ambassador had received from the Imperial Government. What caused it to be received as almost tantamount to a settlement was not so much what it explicitly said as the spirit that seemed evidently behind it—a spirit indicated not only by what was contained in the note itself, but even more by the manner of Count Bernstorff's approach to Mr. Lansing, and by the extremely conciliatory character of the dispatch which the German Government sent to ours immediately upon receipt of the news of the sinking of the Arabic. On the face of it—what with the use of the word "liner," and what with the meagreness of the communication as a whole—the note of Count Bernstorff did not by any means cover all the ground involved in our contention for the safety of life upon merchant ships. But it was generally felt that the German Government had probably gone as far as could be expected in its first disavowal of a submarine policy by which it had set such great store; and that, while thus "saving its face" as far as possible in this communication, it would presently become clear that its yielding to our contentions was substantially complete.

The destruction of the Hesperian must bring sharply home to the country the necessity of a more solid basis than this for national assurance. The Administration has maintained a prudent reserve, indeed almost complete silence, on the subject. A few words of general satisfaction were all that Secretary Lansing permitted himself when the long-standing tension upon which the interest of the whole nation had been centred was suddenly relieved; and nothing has been added since, either by the Secretary or the President, to that brief comment. Accordingly the Administration will not be under any embarrassment whatever in any determination which the Hesperian incident may influence it to take as regards the nature of the assurances which it will accept as satisfying our demands, or as to the time during which it will be willing to wait for that fuller statement of the German position of which Count Bernstorff's note appeared to be merely a precursor. Even if it shall turn out that the sinking of the Hesperian was caused by a mine and not by a submarine, in which case the event has logically no connection with the dispute, it will still have served psychologically to sharpen the issue. We shall all be more anxious to-morrow than we were yesterday to get a clearer definition of where the matter stands than is given in Bernstorff's note; and the sooner it is obtained the less danger will there be of everything being upset by some new and startling occurrence.

SEDAN DAY ONCE MORE.

Forty-five years ago, when the news of Sedan and the fall of the French Empire reached this country, the event was hailed not only as a great military achievement, but as the triumph of a just cause. At that time the world did not know of Bismarck and the Ems telegram. But even if the Iron Chancellor's share in bringing about the war had been known, it is doubtful whether the sympathies of this neutral nation would have been radically different. The fundamental issues would have remained the same. The German states were fighting for the realization of their national unity against a Government whose basis was the Napoleonic tradition and whose prestige, now rapidly waning, had been nourished on foreign adventure and the glory of playing the arbiter of European destinies. The Napoleonic empire represented a dying tradition. Merely the revolt of the German people against French aspirations towards a European dictatorship would have been a service to civilization. But in itself the new German Empire marked the advent of a new force rich in potentialities. "In the interest of that orderly and intellectual progress of which the world now expects Germany to set the example," wrote E. L. Godkin in the *Nation* in September, 1870. In that month Germany stood forth as the conqueror of France and of liberal, neutral opinion.

On the same page that thus welcomed the German nation among the fraternity of the Powers the following words occur: "France has for sixty years sacrificed her peace, her liberty, her literature, and her art to the perfection of her military machine, and has rested satisfied with such influence as it gave her." Substitute Germany for France, and that is the indictment which the press of this neutral country hurled against a military power on the occasion of another Sedan Day, a year ago. During the first week of September, 1914, we in this country did not know how it stood with Germany's case in the trial by battle. We knew that the tide was running in her favor, but how near to success she was we did not know. The first wireless reports of German victories were only a few days old, and we were still under

the spell of the Belgian episode. But if we were uncertain as to the precise inclination of the balance of victory we were under no doubts as to the swinging of the moral balance. It is no exaggeration to say that in neutral America the Kaiser was execrated as the prime mover in the calamitous war, as the violator of treaty rights, as the invader of a weak and neutral country.

Looking back in the fuller knowledge of later events we see that in Germany they were under no doubts as to where they stood in the test of war. They had beaten the Allied armies all along the line in the first pitched battles of the war, they were in close pursuit of the enemy, and on Sedan Day they were within striking distance of Paris. So confident were they of victory and a speedy end of the war that von Kluck, precisely on Sedan Day, broke off his march to Paris, and with superb disdain attempted the perilous feat of parading his army with flank exposed to the enemy's full front, in cheerful confidence of breaking that front and crushing all organized opposition. On September 3 the French Government fled from Paris after issuing an appeal to the country which rang like a cry of despair. We see now that the facts on September 2 warranted the German leaders in believing that they had won. Thus the German nation stood on Sedan Day a year ago, victorious in the field, disastrously beaten in the moral judgment of the world. At Berlin the latter circumstance was held of no account. Right would rally to the side of the victor, and if not, could be dispensed with.

Sedan Day in 1915 finds the military situation greatly altered. The victories over Russia are there to cheer the nation, and the firm hope in ultimate victory is still asserted. But even from the German point of view it is not such a triumph as seemed to lie in the lap of the Kaiser on September 2 a year ago. In beating down Russia at the end of more than a year of tremendous exertions and at the cost of untold sacrifices Germany has beaten only one of a circle of formidable opponents. To bring about the ultimate victory that Germany expects, still greater sacrifices are confessedly needed. To enter into a balancing of precise gain and loss is not necessary here. In actual gain, it is a question whether Germany's conquests in Russia and the west atone for the loss of her merchant fleet, her colonies, her world trade, and the destruction of the splendid industrial fabric which was the great showing of the Germany that arose after 1870.

With the prospect eliminated of a crushing triumph such as she looked forward to on Sedan Day a year ago, a triumph which would have atoned for the moral weakness of her case, Germany has now recognized the need of straightening that fatal gap in her defences. Hence the recognition that she cannot afford to flout neutral rights and neutral opinion. Hence the effort to offset the stigma of Belgium by advancing the promise of a free Poland and the championship of the rights of the Jews in Russia. Hence the unmistakable effort to erase the impression in this, the most powerful of neutral nations, that German victory would be a calamity for the world and to reawaken, if possible, the sentiment of forty-five years ago when Sedan was welcomed in this country as a great stroke for civilization.

THE NAVY'S DILEMMA.

Pity the poor Navy Department! On July 21 President Wilson wrote to Secretary Daniels asking him to get the "best minds in the Navy Department to work" on the matter "of a wise and adequate naval programme." Since then all the minds in the Navy Department have been agitated on this subject, and, if current Washington gossip is correct, the experts are not only up a tree, but are ungracefully reposing in its topmost branches. Or, to use a more nautical figure, they are so far at sea as to be beyond vision of the coast they are to protect. For, if the truth must be told, this horrid European war, while greatly increasing the demand for preparedness, has deliberately unsettled all the established naval theories, and has not as yet definitely established any new facts or tactics or proved the superiority of any particular arm, unless it be the submarine.

Take the question of the battleship. Its supporters admit that it is helpless the minute a submarine appears, and has to flee to the nearest harbor for shelter, there to be protected in every conceivable way. If an English battleship goes to sea to-day, she is surrounded by a small fleet of destroyers and torpedo-boats that course around her "like a pack of mad greyhounds," according to a naval writer. The one argument which the defender of the battleship has is that it has given to England the command of the sea, although hidden away in an obscure harbor, just as the German battleships are put up, in camphor presumably, at Kiel. This is like a game of cards in which no one dares show what he holds, but in which the man who says he has the largest number of trumps wins without laying them on the table. It would seem as if out of this might be worked some international arrangement by which all loss of life on battleships could be spared, and sea-fights avoided, by simply letting umpires count the battleships on each side, as they lie at their hidden anchorages, and award the victory to the side having the most. The drawback to that would be that it would unduly stimulate battleship production. At all events, the fact is that the battleship has proved of no avail in action thus far, and the newest has made little impression on the coast defences of the Dardanelles.

Soon after the war began there was a howl because our navy was so deficient in battle-cruisers—they were to be the ships of the future. Since the inception of our modern fleet, our Navy Department has, like every other, slavishly followed the British. Great Britain had battle-cruisers, and Germany had imitated her, so we must fall in line. Then came the one battle, between equal modern forces, that off Heligoland, and behold! the newest and finest British battle-cruiser, the Lion, was put out of business by a single German shot, which penetrated her vitals and so disabled her that she had to be towed in as if she were a wooden frigate of 1861. Then it appeared that the chief damage to the German ships was done to their decks, the range being so great (the big ships actually began firing at each other when they were only just visible through telescopes) that the British shots, instead of striking the sides, came plunging from above. As a result, there has actually been some discussion in Washington as to whether the decks of ships must not be roofed over with heavy armor! Of course, each ship is to have a triple bottom hereafter to guard against submarines—all of which enormously increases their cost and unwieldiness, and yet gives no assurance whatever that the ship will stay afloat if submarined.

Indeed, before the war, a French admiral, Degouy, went so far as to say that the only hope for the battleship was its transformation into a submarine! The submersible battleship, he thinks, will be about the size of the surface ships of ten or fifteen years ago. But the British have shown that the aeroplane is a very effective weapon against the submarine, and if you greatly increase the latter's size, it becomes much less immune from attack. Again, if you can have submersible battleships, you can have submersible cargo-boats, as the *Manchester Guardian* points out, and then what is to be-

come of submarine blockades, or any other kind? Then, to the confusion of the experts, submarines have been sinking submarines, and the British appear to have developed a defence against them which is beginning to tell heavily—the English have lost only four or five auxiliary cruisers by torpedoes in the last eight months in all the warfare in the Channel and the North Sea. No regular British warship has been sunk outside of the Adriatic since January 1. None the less, as British writers freely admit, the submarine has done so well that it is likely to be the prevailing type of warship, with its antidotes yet to be fully developed. However, it has been suggested in Washington by an officer that if a submarine appears on the surface, her crew should carry armored umbrellas to protect themselves from aeroplane bombs!

As for dirigible balloons, of which the navy has ordered one, we are still in the dark as to the failure of the Zeppelins to do anything but kill and maim civilians. It is said that they do not use all the terrible explosives they could carry because it would stagger humanity if they did. At any rate, here is another problem the navy men have to dispose of. As for questions of gunfire, if naval battles are to be fought by ships at a range of twelve miles, or when they are almost invisible, every preconceived theory of gunnery must be cast aside. Truly, the lot of the navy officers and officials who must make their recommendations to Mr. Wilson is not an enviable one. At heart many of them must agree with the common-sense of Representative Kitchin's statement that the time to legislate for the navy is when the war is over and its lessons can be really ascertained. As it is, the chances are that, being compelled to ask for something, and not knowing what, they will pass the plate to the taxpayer for a good bit more of everything—in fear and trembling lest the needlessness of the soup and the fish become apparent before they can draw from the Treasury what Congress grants for the roast and the dessert.

WHAT MAY BE HOPED FOR FROM THE "SHORT BALLOT."

In a letter printed in the New York *Evening Post*, the claims of the short-ballot amendments are challenged upon grounds quite different from those which have been most current. The correspondent does not seek to dispose of those claims by labelling the proposal as undemocratic; he envelops the question in an atmosphere far more philosophical. But whether objections of the nature of those advanced in this communication have more substance than those of the ordinary standpatter may well be questioned. If there be any who expect that through the mere agency of the short ballot "sinecures, extravagance, trespasses, and graft, and all the ills that afflict the body politic where a short ballot does not exist, will promptly disappear," we quite agree with this writer that there is nothing in experience or in human nature to support these hopes. But we have no reason to believe that either the advocates of the short ballot or any considerable portion of the public which has been won over to its support indulge in any such idle dreams.

In regard to reforms in the mechanism of government, two opposite errors are made with about equal frequency—the error of ascribing to them a self-contained potency which they do not possess, and the error of supposing that if they do not possess this potency they are valueless or of little account. The Australian ballot will not insure pure elections in a community utterly indifferent to the purity of elections; but throughout the country thousands of communities which, in the days of the old-fashioned ballot, were constantly afflicted with the evil of fraudulent elections, have found it perfectly easy almost completely to eliminate that evil. The merit system in the civil service does not by merely being written into the statute book do away with the spoils system; but in the national Government, and in a number of our States and cities, the merit-system laws have been quite sufficient to reduce to comparatively insignificant dimensions the plague of spoils—and this during a period in which the magnitude of the spoils themselves, or rather of what would have been spoils under the old system, has enormously increased. In this matter there has been accomplished something little short of a revolution; and it was accomplished without any change in human nature. The mere writing of the law alone did not bring it about; what it did do was to give efficacy to sincere and intelligent efforts directed to that end, which without the law would have continued to be ineffective.

It is the same way with the short ballot. Like nearly all the maxims that condense into an epigram great questions of human conduct, those that point to the futility of mere changes in governmental mechanism are but half-truths at best. That "the stream cannot rise higher than its source"; that "the welfare of society is dependent upon the character of its members"; that, as Pope has it—

> For forms of government let fools contest,
> Whate'er is best administered is best—

all these things are very good as warnings against the expectation of miraculous relief through mere readjustments of form. But to accept them as complete guidance would be to ignore both abstract reason and concrete experience. In some sense it may be true enough that a people gets as good government as it deserves; but everything depends upon what you mean by deserts. If we were all sufficiently wise, sufficiently virtuous, and sufficiently energetic, we could doubtless compel good government out of any form of laws and institutions, however absurd. But taking men as they are, nothing is more certain than that the degree in which the excellence of their government may be made to correspond to the desires of the community depends to a quite immeasurable extent upon the ease or the difficulty with which the apparatus can be made to respond to those desires. The people of New York State, for example, some years ago showed quite unmistakably that they wanted the kind of government which was represented by the character and the purposes of Gov. Hughes; they showed it not only in electing him, but in the way in which they responded to his appeals for support against the forces with which he had constantly to contend while in the Executive chair. Will anybody say that it would have made absolutely no difference if he had been free to give himself to the accomplishment of his purposes without being compelled to struggle with those obstacles?

That New Jersey has had the short ballot and yet has suffered under an aggravated form of boss rule only shows that more is necessary for the achievement of pure and efficient government than the mere shortness of the ballot. On the other hand, when one speaks of the failure of the movement towards concentration of responsibility in our cities to cure the ills of municipal government, we can but say that one flies in the face of facts which, so far as we know, very few would dispute. It may almost be said that the adoption of the New York city charter marked the beginning of a new era in American municipal government, an era presenting so great a contrast to what had preceded it that the most sanguine reformer could hardly have supposed the change to be possible in so short a time. There is scarcely a great city in the country that has not advanced to a position in which scandals

which in former days were regarded as matters of course have come to be almost unthinkable; and increased concentration of responsibility has undeniably been a chief agency in making this improvement possible. But, as the history of our own city only too amply attests, the change has been by no means automatic, nor indeed has the progress been one of unbroken continuity. The better form of government has but been a means of making solid achievement possible by a reasonable amount of earnest effort, whereas under the old form the effort required was beyond the capacity of our store of civic virtue. And the same thing may be expected in the State government when the same means have been put within the reach of the citizens, and the same power lodged in the hands of those to whom they entrust the administration of their affairs.

NERVE AND SKILL IN COMPETITION.

What has been said about the higher standardization that seems to have been attained in tennis as compared with golf would be borne out by the showing in the two championship competitions just finished. Of the golf "triumvirate"—the word has shot up into popularity, and triumvirates we shall have for some time to come—all three went down in the early rounds. Of the tennis triumvirate all survived the early rounds. At Forest Hills the older players prevailed. An upset in golf usually means the triumph of young pluck over tried skill. In tennis, on the other hand, it means usually the triumph of veteran strategy and cunning over fiery youth. That golf is the more open game is shown by the number of men who have won first and second place during the last ten years. In golf the twenty places have been held by fifteen men. In tennis the twenty places have been held by only six men.

In theory, the showing ought to be the other way. Games may be divided into two classes, the full competitive and the semi-competitive. In the first you fight against nature and an opponent. Such are tennis, baseball, football, where there is another man to prevent your working your will on the ball. Golf comes with all the field sports under the semi-competitive games, where essentially you play against yourself. Your own condition primarily determines how fast you will cover the mile on the track or the four miles on the water or the eighteen holes on the links. Any interference with an opponent's doing his best constitutes a foul. In golf the only element of the kind is the stymie, and the morality of this play has lately been brought into question. In theory, tennis would be on the same basis as golf if the game consisted entirely in serving and the winner were determined by the least number of double faults in a given number of strokes. Yet theory is put entirely to flight by the facts. Golf, instead of being the more consistent game of the two, is much the more erratic. A correspondent from Detroit protested against the description of one player's game as mechanically effective. There is nothing mechanical in golf; and he quoted one eminent professional of the links: "You can't get far if the Lord isn't with you." This would put golf in the same class with the German armies.

To speak of golf as semi-competitive is to allow for the element of human opposition. Ouimet's fight against Vardon and Ray was very nearly as direct combat as if the English players had been permitted by the rules of the game to intercept Ouimet's ball and send it into a trap or bunker. The factor of playing to win enters into all games. And yet there is golf history, with its numerous instances of practice games made in marvellous figures, proving that the presence of a human opponent is not essential to bring out the best in a player. If, therefore, golf is uncertain, the explanation may be found in two facts: first, that the most formidable human opponent a man can meet is himself, and, secondly, that an inanimate opponent in the shape of bunker, trap, water hazard, or deep grass can arouse as much exasperation and be as fully destructive of nervous tissue as the most alert of living competitors. If anything, the obstacle is the more serious in golf. It is dumb rage that throws a man completely off his game, the presence of an enemy who is visible, but silent, contemptuously indifferent, who will not be "rattled" by your fine shot, and will not grow reckless when it scores against you. The effect of a sliced drive behind a tree, for its destructive psychological reaction, is not to be compared with a deadly placement by McLoughlin.

The psychology of golf is a problem which, we believe, Professor Münsterberg has not yet tackled with his measuring instruments. The results would be interesting. We might obtain a more precise explanation than the one outlined above for the puzzling fact that in golf, which theoretically should be more certain than tennis, we never dare speak of the invincible Travers as we used to speak of the invincible McLoughlin.

Foreign Correspondence

GERMANY IN ANTE-BELLUM FRANCE—PEACEFUL PENETRATION VERSUS WAR.

By STODDARD DEWEY.

PARIS, August 21.

Have Americans any idea of the extent to which—before the war—Germans had penetrated France? Those in France who knew best the conditions of her industry and commerce, and agriculture, even, were not awake to it. Now that it is becoming known, it throws a queer light on Germany's attempted justification for entering into war so recklessly—that she was "encircled" and deprived of necessary "expansion."

The French Government has so far "sequestered" over 12,000 properties held by Germans in France. This represents rather more than fewer business enterprises; for many were company properties with branches in various parts of French territory, or one company was often engaged in multiple trade. The number also does not include countless business houses and undertakings carried on by more or less freshly naturalized French citizens hailing from across the Rhine and still retaining interests there. These sequestered properties are neither confiscated nor are their business operations brought to an end; but they are placed in the hands of a French Government receiver, to be administered with strict accountability until the peace settlement shall decide their future status.

Exactly what number of individual Germans thus found their opportunity of money-making in France it would be difficult to calculate; and moreover these openly German houses do not account for all the Germans finding occupation in France. They were everywhere—waiters in hotels, and brokers' clerks at the Bourse, and wherever international commission business or intermediaries were needed. And this leaves still beyond calculation the really German companies organized under the French law, which little by little were taking vast control of all sorts of industry and trade and navigation. And it was the same in Italy, not to speak of England.

A good example of what has been going on is the quite recent sequestering in Paris of the properties of a single man—Herr Jellinek, of the famous Mercedes Company. For the rest of France this had been done some time ago. They were his private properties, and are roughly estimated at a value of $40,000,000. There was among them at least one hotel and villas on the Riviera; but he was also chief stockholder in six Paris hotels, in another at Trouville, and so on.

The most notorious of these was the Hotel Astoria, which now serves as the Japanese ambulance hospital. At the very beginning of war, while the hotel was still open, a wireless telegraph station was discovered on the roof, and a war story was made of the manager having been set up against a wall and incontinently shot. That is perhaps the way things would have been done in his Fatherland. In reality, the French authorities accepted his explanation, good or bad, and he

has been in a concentration camp until, very lately, a charge of embezzlement brought him back to answer before the courts.

The real crime had been, for half a dozen years, the existence of his hotel building. Contrary to all municipal regulation, its height had been run up above the sky-line of the neighboring circle of uniform houses, which give due proportion and symmetry to the great open space around Napoleon's Arc de Triomphe. Art Kolossal in such a neighborhood! Across the circle another hotel, also I think controlled by Germans, had set the example a little earlier, but not with such enormity. Well, until the war, neither legal process nor municipal right had been able to bring about the due cutting down of this monument!

It is not the place here to go into the very complicated subject of the preferential treatment of Germany by France in matters of international trade, and of German trade in France itself. This was a result of the Treaty of Frankfort, which was made after the war of 1870, and has been backed up *manu militari* by Germany ever since. Besides customs tariffs and treatment more favorable than the most favored nation clause ever secured for England, its hard and fast provisions were so interpreted as to give the German resident in France privileges over Frenchmen themselves.

Baron von Schoen, the last German Ambassador, was an adept at such interpretation, and terrorized French Government authorities with his threats. A German business of automobile tires, organized as a French company, ought legally to have manufactured in France the products which it put on the Franch market—or it should have imported them from its German factory, duly marked "made in Germany," and have paid the legal duties. It found it cheaper to make its tires in Germany, to declare them at the frontier as undutiable material, and to mark them—beforehand at the German factory—"made in France." When the French customs tried to apply the law against this puerile evasion, Baron von Schoen became so threatening that the breach of law and treaty was overlooked. So it was ever since the Kaiser's threat at Tangier, and particularly since Agadir.

This was direct sharp practice, but the ultra-scientific "specifications" of a new customs tariff made by Germany also kept for herself all the favors in the reciprocity guaranteed to France by the Treaty of Frankfort. The few who follow in the United States American international relations will not need reminding of the virtual confiscation of Standard Oil property which was only suspended by the war (if it has been suspended), and the laughing of our diplomacy out of court in the negotiations concerning the potash monopoly some years ago. As to France, during forty-four years Germany has been her everlasting Shylock.

A little inland from the Norman seaport of Caen, there was iron ore which the French had not succeeded in working. Little by little, Herr Thyssen, the rival of Krupp, bought up the land roundabout, and obtained a concession for a railway to the port, where he bought wharfland. A hue and cry was raised just in time to allow Government to take over the few miles of rail, but Thyssen kept 40 per cent. of the mining company's stock, with the obligation of using his German coal in the smelting. A line of vessels was to secure communications comfortably through the length of the Channel to a port in northern France, and so on to Germany. The completion of this scheme for Germanizing France war, too, has frustrated; but a similar taking possession of French mines by Germans was elsewhere an accomplished fact.

In the long run, more important than these showy enterprises would have been the slow, steady, sure infiltration of Germans into every line of French business. There is a big dress-making house near the Paris Opéra, the fingers of whose German backer were in many pies, including a fashionable perfume. Looking down the list of sequestered properties in Paris and surroundings, I find machine tools, and antiquities, clocks, cabinet-making, and galvanized tin boxes, commission houses, gloves, furs, knives, jewelry, electric appliances, numerous "banks," and so on, and so on—and "articles de Paris." At Havre, Germans had their hands on coffee, cotton, pepper, oils, dye-woods—with a pork butcher and a ladies' tailor. In central France, in the remote region of Le Puy, Germans were installed for laces, sewing and farm machines, hardware, leather, weaving, and pottery, lead-pencils, and manufactured rubber (tires "made in France"), furs, beer, playthings, and paper and printing.

So it has been going on all over the fair land of France. In the French protectorate of Tunis, ninety-seven German business houses have been sequestered. Wherever France has put her foot in Morocco, it has been the same; and the Mannesmann brothers were backed by German threats when they claimed universally all mining lands in virtue of concessions, inexplicit and unmapped, obtained from one or other fleeting Sultan. Progress was steady, and French law in practice protected Germans when it did not give them advantages over Frenchmen.

Even yet I have spoken only of the penetration of France by Germans personally. They had no reason to be dissatisfied with the spread of their products, material and intellectual. Their manufactured articles—often, as I have noticed, labelled "articles de Paris"—were in every shop. Their methods of painful erudition triumphed in the University at the expense of French common-sense and clearness. The Salon d'Automne was given over to their peculiar art, to a degree that has made suspicious minds imagine a fell design on their part to do away utterly with distinctive French taste. Opera and one state theatre were won over to their mistiness. And only war has opened to French Socialists the abyss in which the country they loved was to be lost in a Germanization of humanity under the label of internationalism.

All this is now of the past. From workmen to professors of philosophy, Frenchmen have had sharp evidence of war to bring their minds and hearts back to themselves. I wonder if Germans in industry and commerce really expected that victory in war, with all its consequences of destruction and hate, would advance their interests faster than the peaceful penetration which was so sure. Perhaps they, too, are victims of Prussian militarism. It is certainly difficult to see how German business will once more gain possession of France. This generation is not likely to see again the peaceful invasions of German companies under protection of a watchful Ambassador, ready at a moment's notice to emit threats that

—vaulted like rebounding hail.

THE NATIONAL REGISTRATION ACT—AN EMERGENCY MEASURE WHICH WILL PROBABLY BE OF LITTLE SERVICE.

By T. L. GILMOUR.

LONDON, August 17.

We have all been busily engaged during the week-end in filling up the forms distributed throughout the length and breadth of the land, in accordance with the terms of the National Registration act—all of us, that is, who are over fifteen and under sixty-five. Parliament, in its wisdom, has decreed that this record of our national human resources shall be made, and the work has been carried out with, for the most part, efficiency and success from the point of view of organization. Twenty-five million forms have been printed; local bodies have been entrusted with the task of their distribution, collection, and the tabulation of the results, and these local bodies have called for and obtained the assistance of an army of volunteers to supplement their regular staffs. In its way, it is an admirable piece of organization, but its utility is a question upon which there is by no means complete unanimity of opinion. If we are to believe those who have been most clamorous for the work to be done, the completion of the national Register is to mark the beginning of a new era of national efficiency for the purposes of the war. "In twenty-four hours," wrote one enthusiast in a Sunday paper, "the National Register will be an actuality, and in a few days its practical use as an implement of state should have begun." This is, perhaps, the high-water mark of expectation, but it is none the less merely an exaggerated statement of the hopes which have been fostered in the minds of a large section of the population; hopes which, in the judgment of another not inconsiderable section, are inevitably doomed to disappointment.

The one thing which is beyond dispute about the National Register is that it was an emergency measure. No student of what is happening to-day in England can escape from the conclusion that the British Government and the British people are engaged in the gigantic task of improvising measures to meet a condition of things which neither Government nor people have foreseen. In a sense this is a reproach to us; but there is another sense in which we may call this very unpreparedness in aid of our plea that the responsibility for this world-catastrophe does not rest upon our shoulders. The underlying assumption upon which we in this country have hitherto organized our lives has been that peace was the normal condition of the existence of humanity, and war the abnormal. In Germany this assumption has been reversed by the class which counts. I do not see any reason to doubt that the commercial classes in Germany—apart from certain striking exceptions—and the great bulk of the industrial and agricultural workers were desirous of the preservation of peace; but none the less the German Government was organized for war.

The fact itself is not denied, and the best that can be said by those members of the governing class in Germany who feel under any obligation to explain, is that war was necessary as a preliminary to the establishment of that German hegemony of Europe which must ultimately bestow on that continent, not merely the blessings of a permanent peace, but the still greater treasures of the *Kultur* which is supposed to be Germany's large gift to humanity.

This pseudo-philosophic justification of Germany's war-preparedness we owe rather to those amazing professors in whose production Germany appears to enjoy a monopoly than to the East Prussian Junkers who are the real rulers of Germany, and to whom whatever credit there may be for this war-preparedness is due.

And for our lack of war-preparedness we must as a nation take whatever blame may be rightly imputed to us. But the point I want to make clear to our friends in America is that we have had to improvise very largely since the outbreak of the war, that we are still engaged in the difficult task of adapting our resources to the end we now have in view, and that this stupendous task, carried out as it must necessarily be by finite human beings, must equally furnish, necessarily, abundant material for criticism, both at home and abroad. The new National Register at its best can only provide the Government with the means of obtaining certain information on which action can be based, and it is certain that many of the perfervid anticipations based upon the making of the Register are foredoomed to disappointment. If the Register does not "in a few days demonstrate its utility" as an implement of state, the Government will once more find itself denounced in the columns of a certain class of newspapers as wholly incompetent to guide the national destinies. But those denunciations do not interpret the sentiments of the bulk of our people. Business men—the men who are accustomed to handle the practical affairs of life—do not fall into the vulgar error of supposing that twenty-five millions of forms can be tabulated and analyzed in a few days, or a few weeks, or that even when the information is available the Government will be able to assign to each citizen the work which he is most capable of doing to assist the nation in attaining the final goal of victory.

Yet it is as pathetic as it is disquieting to note the exaggerated hopes which are based upon the completion of the National Register. Look, for a moment, at the letter which Lord St. Audries has sent to the press, a letter instinct with the passion of patriotism, in which the writer—better remembered as Sir Alexander Acland-Hood, a former Chief Whip of the Tory party—recalls the reply which Captain Hood, of the Zealous, gave to Nelson at the battle of the Nile, when the Admiral asked if there was enough water to enable him to get in between the French fleet and the shore. "I don't know, sir," Hood replied, "but with your permission I will stand in and try." And here is Lord St. Audries's obviously sincere comment: "At this moment the great majority of men and women in this country want to 'stand in and try.'" But they ask for directions from the Government as to how and where they are to try. When the National Register is completed the people expect the Government to direct every man and woman recorded in its lists to the particular duty for which he or she is best fitted.

Was there ever such a demand made upon a Government? What can possibly be Lord St. Audries's conception of a "Government"? He cannot have a mental vision of Mr. Asquith, Mr. Lloyd George, and Lord Kitchener poring over the Register and deciding into which square, round, oblong, or polygonal hole each of the twenty-five million citizens is to be dropped. But if Cabinet Ministers are not to undertake the task, perhaps it is the permanent Government officials who are to decide our fate. Unfortunately, every Government department is already working under extreme pressure, and has had to be strengthened by the importation of large numbers of competent outsiders. There remains the Registrar-General, who is the official responsible for the compilation of the Register, and under whose supervision the tabulation and analysis of results will be carried out. But Lord St. Audries certainly does not mean that the Registrar-General is to tell him and others in like case what they are to do; still less, I imagine, does he propose to place these autocratic state powers in the hands of the local officials, who are the subordinates for this purpose of the Registrar-General.

The plain fact is that, except for the purpose of obtaining a record of the men of military age who are not actually engaged in military duties, the National Register will probably serve very little useful purpose, and the information as to the men of military age could obviously have been obtained with much less trouble and expenditure, and would have been so obtained but for the fact that, in that case, the opposition from those who do not want conscription would have been much more pronounced than against the more comprehensive scheme. Outside the question of military service, the difficulty which the Government is in is that it cannot utilize a tithe of the men who have already offered their services in any capacity for which they are required.

The pretence that the Register is required because it will bring to the knowledge of "the Government" men whose services could be of use, but who are not offering their services, is offensive and unjust. What is really happening is that the Government offices and individual members of the Government are inundated with offers of assistance from men who feel a sense of humiliation that they cannot render their country some distinct service in her hour of trial. An Eton master writes to the papers to say that he and many of his colleagues offered their services for the school holidays to the War Office, enumerating their various qualifications, but neither at the War Office nor at the Ministry of Munitions could their services be used. It is the same everywhere. There are far more willing workers than the Government can employ, and brutal though it may sound, the plain truth is that many of these crying to the Government for employment would best serve the state by doing better the thing they are already doing, and by practicing that individual personal economy which in the aggregate will contribute so materially to enable the country to meet the colossal financial responsibilities imposed on us by the war.

The Faerie Isle of Mackinac

IMPRESSIONS AND REFLECTIONS.

By W. H. JOHNSON.

I was walking on the ever beautiful summit of Mackinac Island. A shower of rain a few hours before had swept away a trifle of limestone dust, the only soilure that ever stains the foliage along its paths and driveways, where the insistent automobile, with its malodorous fumes, is barred, the heavy wagon has no call to come, and only the light carriage with its smiling group of tourists now and then flashes into sight around some curve and melts away again among the trees.

I had strolled up from the little town through the old fort, and then through the short rifle range. For years no sound of target practice has startled the birds flitting among the cedars and balsams which densely line its sides. Clumps of ground hemlock break the grass which carpets its stony surface, and instead of the soldier's uniform which shone there in years long gone, the daintier blue of a little wild daisy flecks the green of the old range from end to end.

Clambering up the steep, gullied slope at the farther end of the range, I reached the highest level of the island, and after walking a few hundred feet came to "Point Lookout." A few miles to the northeast, a white spot on the rippled water identified itself through my glasses as the little excursion steamer which had left the island an hour before for the winding channels of "Les Cheneaux," whence the poorly mounted forms of a mascallonge or two always decorate the Mackinac docks by way of allurement to the angler. Northward my eye traced the darkly wooded shores of the curving bay of St. Martin, while far off to the east arose the smoke of a freighter emerging from St. Mary's River on its way down the Lakes. In the nearer distance an excursion steamer headed for "the Soo" was passing a long ore barge which was making its way into the straits for Lake Michigan. Below me, covering the mid level of the island to an extent of several hundred acres, stretched a dense carpet of treetops, the soft quivering beauty of which neither brush not tongue could ever hope to reproduce. The coming autumn had already sketched in a foretaste of the color scheme for later on. Here and there the limbs of a beech were tipped with that rich, warm russet brown which, I cannot doubt, was one of the qualities that gave to the tree its hold on the nature-loving soul of Virgil. The birches had a touch of their delicious yellow, a color which, as it appears in nature, so little deserves the discredit heaped upon it in certain connections by the slang of the thoughtless multitude. And the maples! How can one do justice to the unnumbered gradations of red and pink and yellow, now dazzlingly bright and again softly translucent, which had already caught them here and there and would soon transform the whole island into a flame of glory!

And scattered around and among the deciduous trees, now in broad dense groups, now in little clusters, and again in single isolation, was one green of the fir, and another green of the hemlock, and another of the spruce, and another of the pine, and yet others of the tamarack and the cedar, with gray limbs of beeches and white limbs of hirches peeping through it all in a bewilderment of variety utterly inexpressible and yet absolutely harmonious.

Walking back to the southwestern side of the upper level, I gazed upon a different scene. Round Island, with its red lighthouse, lay close beneath, but separated by a deep channel, the pathway of all the great freighters that handle the commerce between Lake Superior and Lake Michigan. Beyond Round Island runs another narrow channel, and then the long island of Bois Blanc ("Boblo," in common parlance), broadening to the southward, and on the mainland across from its lower end the lazily rising smoke from the once-busy lumber town of Cheboygan. The steam from a Michigan Central train drew the eye up shore to Mackinaw City, from the docks of which the great car ferry, "Chief Wawatam," was backing out into the straits, presumably laden with a cargo of empty ore cars for the Duluth & South Shore Railway at St. Ignace. Westward, between the dimly rising islands of Waugoshance and Ste. Helene, one of the great passenger steamers from Chicago was looming black over the Lake Michigan horizon. Lumber boats, ore barges, pleasure craft dotted the straits here and there, while great flocks of gulls, frightened occasionally from their resting places, swept the air for a time in noisy evolutions and settled down again upon the limestone breakwater which protects the Mackinac docks.

In unresisting surrender to the witchery of the scene I had all but lost my consciousness of the severer realities of life when suddenly a whiff of wind stirred a bit of newspaper at my feet and brought into sight the brutal headlines that told of old-time hate and present death and future sorrow on the borderlands dividing half a dozen war-stricken countries of the Old World. And then the thought rushed into my mind: "What might have been, under other circumstances, the condition to-day of this great British-American borderland on which I am standing, amid surroundings that speak only of unmarred natural beauty and human peace and safety? I am actually standing upon the time-worn remains of a defensive embankment which figured actively in the War of 1812." Below me, on the brow of the mid-level, lay old "Fort Mackinac," a mere plaything in comparison with fortresses of recent times, where a little detachment of our troops was maintained until about twenty years ago. The needless fort was then abandoned to the State of Michigan, and to-day its neatly kept walls and barracks are but one of the attractions of the State Park Association. As I trained my glasses on it, a golden-haired girl sat jauntily on the diminutive cannon which adorns one of its angles, and a young man at one side was focussing his camera upon her—the whole scene but little more suggestive of present-day fortresses than the boy's sailboat on the pond of Boston Common is suggestive of the Dreadnoughts now guarding the North Sea. Why is it thus?

Why do we give up to health and pleasure an island so near the border of a land once hostile, an island actually used in deadly warfare with that land a century ago, an island suited by its very nature for transformation into an impregnable stronghold, an island which, through its proximity to the mouth of the St. Mary's River and its absolute command of the entrance to Lake Michigan, would be of the most vital importance in case of war with our neighbors to the North? *Why?* The answer is simple. Considerations of human brotherhood have been allowed to have their way. Good sense has combined with good feeling to choke down among us that accursed falsehood of the ages that great nations cannot live and prosper side by side, free from the demoralizing suspicion that each is but waiting and praying for an opportunity to strike the deadly stroke that will enable it to build up its greatness and glory upon the ruins of the other. We look with contempt upon the man that prates of an "inevitable" war between these two nations for the control of North America. We spurn the lie that "peace" with the British is to be secured by turning our northern border into one long potential Hell of fire and steel which our neighbors will not dare to stir into action. We leave our mighty inland seas free from the menace of the Dreadnought, and our toilers keep in their hands the unlimited millions which would be wrung from them under the stimulus of a falsely named "patriotism" if the policy of border fortification were adopted. *War inevitable?* The time will yet come when among civilized nations that word will be more applicable to peace.

The next day, as I sat on the deck of a Detroit steamer and looked at the island settling back in the distance, another thought came to me. In various ways we have been commemorating a century of peace with Great Britain. What fitter memorial of that peace, what better earnest of its continuance, than a stately column rising into the air from the summit of Mackinac Island, its base resting upon the very site of the upper fort? The beacon light from its summit would catch the eye here and there of the traveller and boatman coming down from "the Soo," would gleam far beyond Detour over northern Huron, far south over the sailing routes to the lower lakes, and far out beyond Waugoshance and Ste. Helene into upper Lake Michigan, far over the woods and fields of both peninsulas of Michigan and into the Canadian forests beyond the St. Mary's, and everywhere it would carry its reminder of that peace whose blessings are so much a part of our everyday life that we lose consciousness of their source and of the conditions of their retention. What better use could some one of our wealthy philanthropists whose fortunes have had their genesis so largely in this northern region make of some portion of that gain than to build such a monument, dedicating it in some fitting form of words to that nobility of purpose and clearness of insight which have enabled these two nations to realize that the way to maintain peace with each other is to believe in peace and to prepare for peace? And in such a monument there might be a prophecy of the day when it will be a safe and fitting thing to melt the cannon that frown over the Straits of Gibraltar and raise their metal on the famous rock in the form of a monument to the assured peace of the civilized world.

Book Notes and Byways

THE MODERN PART OF A UNIVERSAL HISTORY.

A few years before the issuing of the first edition of the "Encyclopædia Britannica," that Scottish work, there was published at London, in 1766, the third edition of the Universal History—"the most valuable history that ever was," at least in the opinion of the piraters of the first edition. This has been called "Sale's Universal History." George Sale, translator of the Koran, may have proposed the scheme to the booksellers. But Sale died in 1736, the date given as that of the first edition, folio, of the Universal History, which appeared in parts, so many sheets a month, possibly beginning in 1736. Sale's contribution was for the difficult period from the Creation to the Flood. John Swinton [1703-1777] had a share in the work. He had been for a time chaplain of the English factory at Leghorn. Boswell says of the learned Mr. Swinton that he was absent-minded, so much so that preaching before malefactors to be executed during the week, he ended his discourse by saying he would continue "on next Lord's Day." George Shelvocke [d. 1760], son of the privateer whose voyage furnished Coleridge with the Albatross incident, had a part in the composition of the Universal History; as also George Psalmanazar [d. 1763], the famous literary impostor who, born in the south of France, posed so skilfully as a Japanese convert. Archibald Bower, of Dundee [1686-1766], Jesuit and then no Jesuit; and Dr. John Campbell, of Edinburgh [1708-1775], who never passed a church without taking off his hat, were, according to Dr. Johnson, the other authors of the Universal History. Bower, author of a History of the Popes, wrote for the Universal History the History of Rome to 1453. He is said to have been the general editor of the edition of 1747, receiving £300 and doing very little.

This laborious work was so well regarded from its first publication that it was pirated here and there, certainly in Ireland. The London booksellers who had projected the work determined on a second and revised edition, which began to appear in 1747, with the promise that a Modern Part, then preparing, would shortly be issued. The dedication of 1747 was to the professors in the Universities of Oxford and Cambridge, obligations to them being acknowledged. It is significant that not one of the authors, so far as they are known, occupied a professor's chair at either University;

only Mr. Swinton had any university connection, being keeper of the archives at Oxford for ten years after 1767.

In 1766 there was issued a third edition with the promised Modern Part included—"after a long delay, occasioned by a variety of accidents which could not be foreseen, the Modern Universal History now makes its appearance." Who wrote the long Preface of 1766 to the Modern Part, it would be of much interest to know. Perhaps it was Dr. Campbell, but this is merely a guess. The Preface contains more than one acute observation, such as Dr. Campbell showed himself capable of in his "Political State of Europe," published in 1750. It is clear, for one thing, that we do not know who were the authors of the Modern Universal History, notwithstanding the title page—"By the Authors of the Ancient Part." The Preface runs (p. xiii): "The reader is not to expect to find the same accuracy, either of language or composition, in every part of this history. A plan so very extensive required a great variety of hands as well as length of time to carry it into execution. Sometimes death interposed, and an original author left his work unfinished in such a manner that the plan upon which he went was often unintelligible to his successor. Sometimes materials proved defective, which left most lamentable chasms in the work, that could be replaced only by painful investigation and elaborate researches. . . . We know not, for instance, an authentic history of the European transactions for forty years past. This laid the editors under inexpressible disadvantage." For example, the history of Prussia is given in twenty-one pages (vol. xxxi).

To an American to-day, material of great interest in this work is supplied by Dr. Campbell's history of the settlements in the East Indies (vols. vi, vii, and viii). Indeed, in the Preface it is hoped "that the reader will be particularly pleased with the labor and attention which have been bestowed upon a complete history of the commerce to, and the settlements in the East-Indies by the several European nations; an history which has been carefully compiled from such materials as occur to very few individuals and is indeed the fruit of the most elaborate and successful researches." As much might be said of the accounts of the Gold, Slave, and Ivory Coasts (vols. xiii, xiv).

And who wrote the history of America, before Robertson? (vols. xxxiv, xxxv, xxxvi)—"The editors think they have a claim to the patronage of the public on account of the history of America contained in the following work. It is the first general history of that extensive country that has ever appeared in the English language." It is not impossible that Dr. Campbell put together this first general history of America. Dr. Johnson was a little jealous of "Cawmell," but is reported to have described him as the "richest author that ever grazed the common of literature."

Dr. Campbell had written a "Concise History of Spanish America" which went through two editions; and in 1762, at the request of the Earl of Bute, he wrote a "Description and History of the New Sugar Islands in the West Indies." It must be said, however, that Dr. Campbell, in work certainly his, is scrupulous in the citation of authority, whereas the author of this America is sparing in that regard, and for parts of the British North American Colonies has been content to follow Oldmixon's "British Empire" of 1741, itself a very unequal record. The distribution of this "History of America" is as follows: Mexico and South America, 632 pages; British North America, 458 pages; the West India Islands, 198 pages; Summary, 92 pages; in all, 1,380 pages, large 12mo, reckoning by the format of the edition of 1779.

That is to say, a fourth edition was brought out, 1779-1784, by the Rivingtons, Longman, Cadell, Murray, and other booksellers, who declare in their advertisement that the enterprise had been "accompanied with almost unprecedented expense." These sixty volumes (including the four on the British Isles added after the general and minute index volume), form still a shelf of good reading, eighteen volumes for the ancient history, and the remainder for the modern history, the modern part beginning with the Empire of the Arabs, treating then of all Asia, proceeding on to Africa, reaching Europe by way of Malta, going thoroughly into the Continent of Europe (eighteen volumes), with fitness entering upon America immediately after the Kingdom of Savoy. Not one of the known authors was living in 1784 when the sixtieth volume appeared, and changes enough had been wrought during the publishing of the Modern Part, to say nothing of the Ancient.

A. J. Morrison.

Notes from the Capital

A GRADUATE IN ASTRONOMY.

As the spokesman of Ambrose Swasey to announce the establishment of an Engineering Foundation with a fortune built on telescope-making, Henry Smith Pritchett renewed his touch with the profession in which he won his first successes.

In the youthful minds of my generation astronomy was associated with a tradition of flowing gray beards, bent figures, enveloping gowns, run-down slippers, and general shabbiness. Our successors have broken bravely away from it; yet I confess to a flash of surprise whenever I meet Dr. Pritchett on his occasional visits to Washington, and reflect that he began life as a professional star-gazer—began life, mark you! not merely drifted into the calling after middle age. There is not about him the first suggestion of the frontispiece of the medical almanac. His star-gazing began when he was eighteen, and at twenty-five he was sent by the Government to New Zealand to observe the transit of Venus. He saw enough of stars before he was forty-five to avoid hitching his wagon to one, and settled down with his feet on the earth as president of the Massachusetts Institute of Technology. He had already developed a remarkable faculty for attracting the notice of men of large authority and influence, among them Lyman J. Gage, Secretary of the Treasury in the McKinley Cabinet, who called him to Washington to take the superintendency of the United States Coast and Geodetic Survey, which needed overhauling in various parts of its mechanism. It was there the Technology trustees found him in 1900, when they brought him to Boston; but before he had been long in his new position the all-commanding Iron-Master made a bid for his services as trustee of the Carnegie Institution in Washington and president of the Carnegie Foundation for the Advancement of Teaching.

Though within a stone's throw of sixty years of age, and compassing in his career a variety of experiences which would have over-ripened many a person of different constitution and temperament, you might take Pritchett to-day for a well-cared-for man of affairs not more than fifty years old. He has one of those faces that make no pretence of keeping faith with the calendar. It would take a discriminating physiognomist to detect now wherein it had changed materially since its thirtieth birthday, just as it would have required an expert then to estimate its age within twenty years. Its complexion is fresh enough to-day, and the hair and "Van Dycks" that frame it have always run enough to grays to leave the total effect somewhat puzzling. The dapper costume, the energetic gait, the alert manner, and the diplomatic address of this very modern professor are among the first things to impress you with his personality. In conversation, regardless of the direction it may take, you will find him at once well grounded in his own opinions and entirely tolerant towards yours, unless you trench too arrogantly upon some ground which is plainly his preserve and goad him into vigorous resistance. You presently take his measure as a man who, in ordinary circumstances, would far rather go over an obstacle, or around it, than waste time on a tedious and possibly futile effort to force it out of his path.

Whenever he has been placed in control of an office or institution, his first aim has been to humanize it—to bring it into active relations with the life of the present day. At the "Tech." he launched a number of such enterprises, like the study of architectural engineering on lines of insurance against the destruction or deterioration of buildings through the continually extending uses of electricity. The problems of the disposal of sewage and garbage and purification of water were made subjects for special courses of inquiry. Biological investigation was taken up on a fresh plan, by transfer from the laboratory to the open field. With an eye to future possibilities, particular attention was given, in the department of marine architecture, to naval construction, and arrangements were made with the Federal Government for entering yearly a few cadets from Annapolis to perfect themselves in this branch and join the constructors' corps in the navy. Not least in importance among the questions to which President Pritchett addressed himself was that of promoting a closer fellowship between professors and students by means of gatherings in their recreation hours, after the manner in vogue in German universities; but here he found his progress impeded by a protest from part of the community who interpreted his proposal to mean that the use of beer and tobacco was to be encouraged among the student body for sociability's sake. The newspaper paragraphers caught up the idea, and it required a long period of explanation to convince the remonstrants that no particular programme of refreshments or indulgences was included in his general scheme of fraternization.

Just what complete accomplishments are to be credited to Dr. Pritchett in his later associations it may be still too soon to estimate; there can be no doubt, however, in the mind of any one who has read the reports of the Teaching Foundation that he has sounded a new note there. Formal bui-

letins on educational topics are not usually a line of light literature sought by the lay multitude; but Dr. Pritchett's, which bear the mark of his personal authorship, are as entertaining as a volume of light essays. They have the truly human touch; and they lift the cover off shams and dissect the elements of ineffectiveness, or point the way to better methods for worthy schools struggling under handicaps, in a fashion most refreshing. Their philosophic moderation, tinged with a transparent humor, constitutes one of their positive charms; for the temptation to aggressive reformers to mix a little spleen with their candor of speech must be at times too great for any but the best balanced to resist. VIEILLARD.

Literature

THE "EUGENICS" OF WAR.

War's Aftermath: A Preliminary Study of the Eugenics of War. By David Starr Jordan and Harvey Ernest Jordan. Boston: Houghton Mifflin Co. 75 cents.

The fundamental inspiration of this work is the proposition that all war is intrinsically bad. The authors also seem sure that war's consequences are invariably evil. These views are set forth with the fervor and occasional inexactness of expression conventionally known as feminine, and, now and then, with a flaw in logic that more distinctly marks the special advocate than distinguishes the judge. As used, "aftermath" is a figure not closely representing the yeoman's definition, and "eugenics" in the sub-title and in the text assumes a sense that outrages etymology and subverts its common and its academic meaning of race-culture. It is constantly made to imply generative degradation and is occasionally replaced by "contra-selection," expressing deterioration or debasement. Carried away by the sight and study of Macedonian horrors, the writer of the introduction, the chief director of the World's Peace Foundation, makes it a rhapsodical invective against war as war, not a direct argument for peace. His violence weakens a justifiable denunciation of warfare in the abstract, and confidence in his judgment is impaired by his lack of logical precision and of literary balance.

Logical discussion of so grave a question as the fundamentals of war requires catholic comprehension. One may acknowledge war to be an evil, but may justly hold that some wars have been lighter evils than the ills thereby removed or avoided. But when acceptance is demanded (p. 95) for Franklin's dictum that "there never was a good war," the author's commentary, that "no bad war ever gave way to a good peace," immediately sets up an inexorable dilemma. From the premises (1) that all wars are bad, and (2) that from no bad war a good peace can follow, the conclusion is necessary that, once war, there can be no beneficent peace—a practical, if not a logical, *reductio ad absurdum*. The sole avoidance is to suppose that the text misrepresents the thought.

Because of its extent and its intimate relation to ourselves, the struggle for Secession is drawn upon through analysis of existing demographic conditions for continuing examples of the consequences of that war and, by inference, of other wars. Opening the study, the authors place (p. 2) the mortality for the whole country at "nearly a million of young men largely of superior social worth." Another estimate (p. 4) is seven hundred thousand, which, without explanation, is held to be too low by three hundred thousand, and thus for the second time the total is assumed to be one million not unequally divided. In a comment upon the war's continuing influence, is this remark (p. 21): "One is most profoundly impressed . . . with the . . . unutterable loss in the slaughter of a million of similar souls of knightly spirits before they could leave their princely stamp on human issue." Not only is the mortality for the third time set at a million, but the context implies, but does not affirm, that it all fell upon the defenders of the Confederacy, which, of course, was not the case, nor is it so meant. The construction is loose as well as florid, and here, at least, conjecture replaces evidence. Carefully compiled tables of the War Department, published in 1885 and easily accessible, set the aggregate deaths on the Union side from all causes as practically three hundred and sixty thousand, and conscientious estimates by the same experts, based upon the partly preserved military statistics of the Confederacy, assess the total Disunion mortality at three hundred thousand. The vital loss accepted by competent statisticians thus was about two-thirds of that herein assumed. This discrepancy of a third of a million in the deaths, even when distributed over four years among thirty-one and a half million whites (four and a half of military age), may fall within permissible statistical variation; but it shakes one's faith in the accuracy of a study a part of whose argument rests upon the total loss of life and the associated decrement of all kinds.

As a survey of the war's consequences over the whole South would require years, there was contemplated an intensive study of typical localities where the original wastage had been great, and there had followed minima of new manufacturing or other industries which might modify present conditions. There was first proposed for investigation what, with curious disregard of official nomenclature, is persistently styled "Spottsylvania" County, in Virginia. This wisely was rejected because social and economic changes there have tended to obscure the direct biological effects of the conflict; and it is noted here merely to suggest that the collegiate authors owe an apology to the *manes* of Sir Alexander Spotswood for this misuse of his historic name. Rockbridge County, in Virginia, and Cobb County, in Georgia, were then chosen as the crucibles whose dross and slag would best show the operation of war's furnace. Rockbridge is in the upper valley. Its activities before the war were those of the small farmer, and have undergone "no serious economic changes." Cobb County is described as "a rural district on the line of Sherman's march, and therefore laid waste during the war." Cobb County was fought over in Gen. Sherman's advance upon Atlanta, which lies in another county to the southward. It is not in that line of progress to the sea commonly known as "Sherman's march." Hence "therefore," as just employed, may indicate bias rather than knowledge, or it may simply be another example of historic inexactness. Nevertheless, the Federal and Confederate armies that marched and fought through June, 1864, from Kenesaw to the Chattahoochee, subjected the region to the inevitable, whether or not intentional, adversities that accompany hostilities. These justify making the territory an example of the effect of war upon a community that was previously at rest and whose later condition has been little modified by economic changes not directly due to the war itself. But whatever was learned through the investigations in these selected localities has not been revealed. Nothing is said of the conditions in Cobb County, except that they will be treated elsewhere. Of Rockbridge, it is only mentioned that complete records of the local military companies are extant. There follows a superficial commentary on desertion, with no reference to the oath of enlistment or to principles, and little or none to company discipline, to *esprit*, or to the efficient causes of that heinous crime.

Apart from the Macedonian chapter, the book is substantially a discussion of the answers to thirty propositions (therein reproduced) that had been "sent broadcast over the South to the surviving Confederate officers and other men of intelligence, for comment and criticism." "To the surviving Confederate officers" is more likely to be a fault of construction than to be the fact. The propositions, "usually in the words of some thinking veteran," are condensations of opinions elicited from hundreds of representative men, interested spectators of the war, of much that immediately preceded it, and of all, as they prefer to express it, that has meanwhile "transpired." Beginning, the authors thank "these Confederate heroes for their painstaking efforts to help us in our attempt honestly to verify the final and most intimate argument against war, namely, that it robs a country of its fundamental asset, its best young citizenship, the potential ancestors of the 'thoroughbreds' of the coming generation." This definitely announces that the subject-matter is an ex-parte presentation of the negative when war offers itself as a solution of a grave public question. It entirely ignores the possibility that the warrior may uphold against violence high ideals, and defend, even with his life, persons and principles upon whose conservation depends, besides the somatic, the intellectual and spiritual life and the vital prosperity of a community.

The speculations thus grouped assume that various evils are the more or less continuous

consequences of the war, and that otherwise these would not have befallen. They range from the direct mortality of the field to such indirect happenings as an unusual death-rate among war-widows. Sherman's alleged epigram is accepted as a finality, and from it war *quâ* war becomes the parent of all ill. Space permits few selections. The first proposition, weak historically and logically, is "The leading young men of the South were a part of select companies of militia, and these were the first to enlist." No lesson is drawn from this in terms; but its tone leads to the inference that, being nominal soldiers, they promptly responded to the call to arms. The unexpressed conclusion seems to be that, as war is an evil, so the organized constituents of an army are evil agents, and young men taking part therein set a bad example in proportion to their social standing. Now, away from the larger towns, the organized militia in the South was insignificant, and the underlying motive was not war, but protection against possible servile insurrection. Thus in the great State of North Carolina—of 60,000 square miles and a population, in 1860, of 680,000—there were only six companies at the beginning of the war. All through the South the rural companies were virtually merely armed posses for possible summons by the sheriff. In the cities, the "crack" companies, as the Blues of Richmond, the Chatham Artillery of Savannah, the Washington Artillery of New Orleans, were essentially social clubs in martial disguise, with the excuse of a negro uprising in the background. When secession became imminent, of course, a multitude of military organizations sprang up. But they did not cause the war; they were its product.

It is unfortunate that praiseworthy desire for peace should be so blended in the minds of certain emotional advocates with hatred of abstract war, that they fail to admit that any desirable results may be attainable by force. Filled with zeal, itself a form of contention, they seem blind and deaf to example and argument. Nevertheless, our own country owes its independent existence and its unimpaired unity to two righteous wars. Because violent and abrupt death is undesirable, that should not prevent its infliction in self-defence upon armed robbers. In the protection against unprovoked destruction of collective homes and the institutions that secure them, war is as laudable as the defence of the family units. Philosophers and patriots endure, for the advantages expected to follow, financial loss, corporeal suffering, and death itself, the essential elements of conflict, against those who repudiate arbitration and assault without cause. Rapine and merciless destruction are no more the necessary concomitants of war than the *auto da fé* is for the propagation of religion. The argument against physical suffering endured in war is equally applicable to the relief of such suffering through beneficent surgery. In each case, when properly applied, relief and progress follow. The infallible Teacher has said: "When the strong man fully armed guardeth his own palace, his goods are in peace." He is prepared for armed resistance, and there is no suggestion that such resistance should not be made. David's psalm of thankfulness gives no intimation that combat in a good cause is censurable. "Blessed be Jehovah my rock, who teacheth my hands to war and my fingers to fight."

CURRENT FICTION.

Sally on the Rocks. By Winifred Boggs. New York: Brentano's.

The publishers' "catchy" description on the cover, and chapter headings such as "I did some hustle for a husband," give a misleading notion of the character of this story. It is, as these things suggest, a trifle vulgar, but it is also exceptionally clever. The heroine, of somewhat dubious antecedents, has made a living as a third-rate artist in Paris. At thirty-one she finds herself penniless and thrown out of employment by the war. She sees before her a choice between marriage and a less respectable use of her personal attractions. The alternative being granted, she chooses the better part, and selects as the object of her pursuit Alfred Bingley, a highly respectable bachelor of forty, with a comfortable income, living in the village of Little Crampton, where she has friends. Bingley is a novel and amusing person. Self-satisfied, old-maidish, and fat, he is convinced that it is time for him to marry; and in this matter he is guided by a manuscript volume of maxims left him by his mother. This, magnificently bound and inscribed with gold letters, "*The Book*," he religiously consults on all appropriate occasions. Since he is pursued not only by Sally, but by an eligible widow, these occasions are pretty numerous; and the sharp warnings of the late Mrs. Bingley—her maxims are mostly "don'ts"—plunge him into deeper and deeper perplexity. His ultimate emancipation from *The Book* furnishes a most amusing scene.

As to Sally, there are two other men in the story; one a former accepted lover, the other a soldier, cashiered for disobedience, whom she saves from suicide. The village gossip, vigorously caricatured, plays the part of villain. Sally herself is an entertaining if not always plausible mixture of sordidness, good sportsmanship, and a kind of aspiration. The book is crisply written, and shows unusual talent for caricature.

The Invisible Might. By Robert Bowman. New York: McBride, Nast & Co.

This is a tale of the Russia of Mr. George Kennan, the land of oppression and suppression, the antechamber, for free spirits, of Siberia. The "invisible might" is the power of the police, with its careful surveillance and its summary "administrative orders." The victim in this instance is the young wife of an ambitious Russian diplomat. She has fallen under suspicion through friendship with a woman of advanced ideas, and is virtually imprisoned upon her husband's country estate. There comes an English engineer, who develops an abandoned copper mine on the estate. Work is found thereby for the starving peasants, and the whole neighborhood begins to prosper. But the husband's local agent does not approve of this, since it threatens his personal authority and his means of dishonest gain. With Oriental cunning he puts the young mistress into such a position and mood as to provoke a single rash speech, which, reported duly at Petersburg, is enough to condemn her to exile. The Englishman tries to rescue her, but the pair are caught before they have crossed the border, the woman carried off to Siberia, and the man banished forever from Russia. After eight years word comes to him that she is living in a certain tiny Siberian village, to which, under the disguise of an American journalist, he makes his way. The husband is now dead, and the lover is determined to make sure of whatever happiness may remain for them. The scene in which he finds the woman in her cottage, sodden with drink and almost indifferent to him, is a terrible one. He makes all allowances; she has been driven to vodka as a saviour from madness. He insists that she must fly with him and become his wife. But she sees the hopelessness of the attempt; and it is she who, by a woman's means, conquers in the end. The story is told simply and tensely, by one who is evidently familiar with Russian life and with the Russian novelists.

The Young Absalom. By E. Charles Vivian. New York: E. P. Dutton & Co.

The thriving and not too scrupulous manufacturer and his visionary reforming son grow a trifle threadbare as objects of fiction. "The Turmoil" was one of the latest American renderings, and apparently met the enthusiastic hearing which a great number of persons are always willing to give to an old familiar fable with an up-to-date flavor. The young man, Absalom, who is an English young man, and whose unfigurative name is Paul, returns from Cambridge with a head full of that undergraduate socialism which so literally and fatally bases itself upon Christian theory. He finds that the men in his father's employ are ill-housed and ill-paid. The father is devoted to the son, but cannot agree with his views. They part, and the son deliberately becomes leader of a strike in the paternal "works." He has already lost the maiden of aristocratic lineage whom he might otherwise have married; she is unable to share his interest in the populace. It is now for him to lose, through the machinations of the villain, the fight for his people, and (a handy finish for dreamers) his life. The villain is, of course, rich—he is the other member of the manufacturing firm, who cannot permit the father's affection for his son to endanger the business. Incidentally, he uses the good name of his own wife to effect Paul's downfall. When

Paul is slain by a motor, the father, again of course, yields everything he could not yield while his son was alive. It is all (reflects the jaded one, wearily) pretty trite in matter, and in manner not sufficiently fresh to conceal that triteness. On the whole, a book of less merit than most of those importations which its publisher has ventured within the past five years.

CHRISTIAN UNITY.

Restatement and Reunion. By Burnett Hillman Streeter. New York: The Macmillan Co. $1.

Marching Men. By Leonidas Robinson. Boston: Sherman, French & Co. $1.25 net.

Modern Theology and the Preaching of the Gospel. By William Adams Brown. New York: Charles Scribner's Sons. $1.25.

Jesus and His Parables. By George Murray. New York: Charles Scribner's Sons. $2 net.

The author of "Restatement and Reunion" was one of the principal contributors to "Foundations," a book which created a considerable stir in orthodox theological circles. The fact that he is Fellow, Dean, and lecturer on theology and classics in Queen's College, Oxford, is sufficient assurance of his scholarly qualifications. The title of his work indicates its general character. In sympathy with many of the conclusions of modern criticism, he writes, nevertheless, as a convinced Christian and churchman, while maintaining that, in the light of new knowledge, some modification in the text of ancient formularies is an absolutely essential preliminary to the establishment of anything resembling Christian unity. He does not hesitate to charge the Church of England—which, he says, ought to stand primarily for charity, sanity, and the love of truth—with upholding some of the chief obstacles to it, especially in the matter of inter-communion. Absolute unity he regards as neither possible nor desirable, as it could only be imposed by a dogmatic authority, which inevitably would provoke worse revolt and confusion. He suggests, as the wisest and most practicable policy, progressive federations first between the various sects within the leading Protestant communions, and then between those communions themselves. This, he thinks, might pave the way to an agreement with the Orthodox Eastern churches. This accomplished, the Roman Church would be deprived of its numerical preponderance, and might be induced to make concessions. In considering Church and State he gives a masterly summary of the correlation between the ecclesiastical and political histories of Rome and Constantinople.

In "Marching Men" Dr. Robinson considers current problems of childhood, pulpit, and pew. He displays rare common-sense in his remarks upon the mischief done to religion by the Puritanical spirit, which has invested it with a Pharisaical solemnity and dissociated it from the innocent joy of life, especially in the case of children. An ardent supporter of the principles of Froebel, Pestalozzi, and Dr. Montessori, he maintains that dogma forced upon children is a fertile source of infidelity in adults. To the clergy, as teachers of young and old, he recommends diligent study of modern psychology. Fervently evangelical in spirit, the main thesis of his book is the inspiration and organic unity of the Bible as a whole, which, he maintains, are not affected by modern literary and scientific criticism, much of which he regards as well founded but immaterial. Particularly interesting is his citation of Judaism as a lesson to Christian dogmatists.

In his "Modern Theology and Preaching of the Gospel" Dr. Brown, professor of systematic theology in the Union Theological Seminary, discusses the present opportunities and duties of the churches. This book exhibits spiritual vision and broad toleration, combined with forceful and attractive logic. Arguing that modern theology—of which his definition, it may be remarked, is somewhat indefinite—has actually been of essential service in clarifying and broadening, and thus strengthening, the true Christian perception, the author, with a studious avoidance of dogmatic assertion, maintains the authority of the Bible as the history of a progressive revelation, which had Christ for its chief illustration and which is still proceeding. For the proof of the divinity of Christ he relies not only upon the fulfilment in his person of the prophecies of the Old Testament and the record of the New, but upon the perfect realization in his character and conduct of the God-like man, intensely human and divinely spiritual, whose production was the object of the whole creative scheme. To further this purpose, he goes on to argue, is the duty and privilege of the whole Christian body, working under the direction of the churches, the repositories of sacred truths. For these the present imperative duty is the abandonment of futile disputes over man-made creeds and formularies and organization for the effective propagation and establishment of essential Gospel principles.

Dr. Murray, in discussing the parables of Jesus, groups them under five heads: Grace in the Individual Life, Pharisaism the Foe, Fellowship with God the Ideal, The Course of the Kingdom, and Discipline and Judgment. It is a somewhat arbitrary, but, on the whole, convenient and satisfactory arrangement. There is nothing particularly new in his exposition, but he writes with a thorough comprehension of the aptness and significance of all the minor details of plan and circumstances, and with clearness and conviction. In tone he is broadly evangelical, and in his interpretation of some of the less obvious meanings ingeniously definite.

The similarity of intent and, broadly speaking, of argument, in these books, representing different schools of religious thought, indicates a growing conviction, even among theologians, that the efficacy of the simple message of the Gospels is not increased by the multiplication of ecclesiastical interpretations and ordinances.

THE DATA OF POLITICS.

Bodies Politic and their Governments. By Basil Edward Hammond. Cambridge University Press; New York: G. P. Putnam's Sons.

This volume is not, as its title might imply to the unwary, a study of contemporary States and Governments. It is rather a contribution to the data of political evolution, a sketch-book of movements in the history of statecraft, with a genealogy of political institutions based thereupon. About a dozen years ago the author published his "Outlines of Comparative Politics," in which he began with a new classification of political communities and then proceeded to group his historical surveys around each type or category. The present work is not a mere revision of that useful volume: it is a complete re-writing of it, with much new material and a reversal of the method pursued. The historical surveys now precede, and the classifications follow.

By far the larger portion of Mr. Hammond's discussion is devoted to a description of ancient and mediæval governments: Greek and Roman political institutions take up, in fact, more than half his pages. Here he is on familiar ground, but his very familiarity is to some extent an obstacle, since the prolixity of detail often really obscures the panorama that he is striving to set before the eyes of his readers. Useful summaries are given from time to time, however, and these help greatly to clear the course of the narrative. The author believes it to be demonstrable that, in ancient communities particularly, the parentage or derivation of a political institution often exercised a paramount influence in determining its character. Hence he arranges his bodies politic in genealogical tables which illustrate, as it were, the pedigree of each.

The later chapters endeavor to supply the data for conclusions on the relationship and descent of political institutions in modern states. Europe gets the bulk of the author's attention, but the Government of the United States receives twenty pages of portrayal, on most of which there are, unfortunately, some serious misstatements. Not all of these errors can well be catalogued here; mention of a few will indicate how easily the author has slipped into pitfalls that might readily have been avoided. The words "original jurisdiction" in the Federal Constitution do not necessarily convey "sole jurisdiction" (p. 486); it is puerile to say that the States of the Union may draft their own Constitutions subject to the single condition that they cannot "set up a king" (p. 387); and it is not correct to state broadly that the lower house of Congress "must be elected by all the citizens" (p. 488). In one place we are told that "by the year 1789 the Constitution had been ratified by conventions in all the thirteen States" (p. 485); a little later we learn, more accurately, that "by 1790 all the thirteen com-

munities had ratified" (p. 490). Readers may well open their eyes at the statement that the first ten amendments "only made clear what was doubtful" in the original Constitution, and that the delegates in the Constitutional Convention would probably have incorporated these amendments "if they had occurred to their minds" (p. 490). "Each Federal Court," Mr. Hammond discovers, "has one officer, a marshal, to put its decisions into execution," but lest it be thought that our judicial decisions go unexecuted, the author quickly explains that "if the marshal is impeded in his duty" he can "summon Federal troops from Washington, the seat of the Federal Government" (p. 493).

With reference to the growth and government of American cities, it would be hard to crowd into three pages a more absurd chronicle than this volume gives us. Let a short quotation suffice to show how far the author's study has been careful or his judgment sound:

> The thirteen States that made the Union had the power to rule their cities, and while the cities were small they made use of it effectively; now that the cities have attained to great size and wealth it is of no avail, because the cities partly by numbers of votes and partly by bribery and threats control the legislatures of the States; . . . The cities are independent, or are city States, in almost every particular except that they wage no wars, and thus are like the Greek maritime cities before 480 B. C. . . . It is not then surprising that they have class governments, or perhaps I should say, bastard class governments. . . . New York can afford to keep an adulterine class government because it can never need to defend itself in war (p. 499).

One may well be inclined to fight shy of the "pedigrees of bodies politic" if they are to be compiled from such data as these!

THE JAPANESE IMMIGRANT APPRAISED.

The Japanese Problem in the United States. By H. A. Millis. New York: The Macmillan Co. $1.50.

There was a call for a discussion, up to date, of the highly important Japanese question, based on indisputable facts, gathered from the whole extent of the field, and interpreted by one who is at home in such discussion. Happily, these conditions are realized in the present treatise. Professor Millis was chosen by the Commission on Relations with Japan, appointed by the Federal Council of the Churches of Christ in America, as a specialist who had already given time and attention to the subject of immigration. Five years ago he was employed as agent in charge of the investigations made by the Immigration Commission in the Rocky Mountain and Pacific Coast States. The book does not supersede that excellent piece of work, "The Japanese American Problem," published last year by Dr. Sidney L. Gulick, to which it may be regarded as supplementary. In literary finish and other valuable qualities it is distinctly inferior to its predecessor. The absence of an alphabetical index, for instance, is a drawback.

The writer's point of view naturally differs from that of Dr. Gulick, who, as professor in a Japanese institution, regards the question from the side of fair play for the Japanese immigrant. Professor Millis, on the other hand, is interested in the Japanese immigrant as one of a group comprising Chinese, Mexican, Russian, Austrian, Filipino, Hindu, and even Spaniard and Porto Rican. The Japanese compares favorably with any of them, being "intelligent, studious, cleanly in his habits, generous, temperate, moral, law-abiding, industrious, and ambitious" (p. 229). It is in the salmon canneries of Alaska that Japanese laborers make the poorest showing, and "are universally regarded as much less desirable than the Chinese, and even inferior to the Filipinos, who have recently engaged in that industry." Perhaps the reason is that the climate is too cold for their liking, and that an inferior type goes north. Japanese civilization suits the warmer temperate zone. It is to be noted that the leaders of Japan in the past half-century have all come from the extreme south of the islands, from Nagato, Satsuma, and Tosa. The race seems to reach its limit of natural expansion northward at the Straits of Tsugaru, separating the main island from Hokkaido, which is a colony in the Roman military sense of the term.

The Japanese problem in this country almost limits itself to California, where the climate is thoroughly congenial to Japanese habits. About two-thirds of the whole Japanese population in the United States are found in the boundaries of this State. Next in order comes the State of Washington, with a total of 14,794, or less than one-sixth of the whole. These figures give a percentage of 2.29 in the total population of California, and of 1.06 in that of Washington. Oregon has never particularly attracted Japanese labor, and no anti-Japanese sentiment has displayed itself in this State, where the Japanese form only .47 per cent. of the whole population.

Unfortunately—a point commented upon by the writer—the Japanese found themselves at the outset, as immigrants, confronted by a latent hostility, being regarded as Chinese of a different stripe. Some of Professor Millis's statements, however, require modification. So far from the two languages being alike, they differ utterly in essentials, although the Japanese have adopted Chinese ideographs for the written language, and from these have evolved a syllabary for their own tongue. Indeed, the burden laid upon Japanese students by the need of memorizing four or five thousand Chinese ideographs before they can be recognized as literary adepts—a task infinitely more alien and heavy than the acquisition of Latin by the European lad—is already proving a bar to the return to Japan of Japanese born in this country. They shrink from entering a life where so much wearisome memorizing would be a necessary preliminary to social and intellectual influence. The process of Americanizing these young people has been going on much more effectively than is generally believed, although it is patent to keen observers from the other side of the Pacific.

From what source, by the way, does Professor Millis draw his ethnological data? He tells us (p. 239) that the Japanese are "a mixture of Malay, Mongolian, Tartar, Caucasian, and negro, or Negrito, elements." This admixture of negro or Negrito blood is not even a matter of discussion in standard treatises like the histories of Murdoch or Brinkley, although their findings are by no means in agreement. Racially so similar to the Chinese, they differ radically in language and polity. The relationship between rulers and people, close and friendly in Japan, in China is remote and "unkindly." Thirty years ago the State of California was able to rid herself of the Chinese menace in a remarkably easy fashion, for the Chinese Government is helpless to intervene when its subjects are abused, and is deaf to such appeals. No government more fully recognizes this claim than the Japanese, and none is better prepared to assert it. Hence the danger in the whole situation from the Californian having formed a wrong estimate of the "Oriental." The Japanese has shown himself "cocky." Moreover, as Professor Millis points out, the Chinese laborer was quite willing to live in a "bunk-house," while the Japanese seeks and welcomes opportunities to live like a "white man." As the author explains in one of those badly constructed sentences which mar the quality of the book: "With ambition to rise, and little capital required to purchase the few implements needed and to pay the initial rent, and with the possibility of chattel loans on crops, it is only natural that the Japanese should in many cases have become independent farmers."

While the solicitude of his home Government in watching over his interests has increased the hostility to this new unsubmissive type of Oriental, he has had no powerful church to look after his interests and aid in "assimilating" him. The Irishman, who was so unpopular sixty years ago, had the Roman Catholic Church ready to stand by him; so was it later with the Italian immigrant. Only a limited number of Japanese are closely associated with the evangelical churches, and they are apt to receive a frigid welcome at the regular Sunday services. The process of assimilation will necessarily be slow, and is not likely to take place, as Professor Millis concedes, with large numbers. But a valuable quantum of the Japanese resident population ought to receive every chance of assimilation, for "the evil of race mixture is pretty much of a bogie."

The whole question, indeed, must sooner or later be taken from State Legislatures and dealt with by the Federal Government. The so-called "gentlemen's agreement" of

1908 works well, but in its very nature it is only temporary. What supersedes it must also come direct from Washington, and be national in its scope and application. Professor Millis recommends a general immigration law such as is outlined in Dr. Gulick's "The American Japanese Problem" (pp. 284-286), with some modifications. "Amend the existing law," thus runs his suggestion, "so that except in the case of Canada, Newfoundland, Mexico, and Cuba, the number of immigrants admitted in any one year shall not exceed 5 per cent. of the total of those who had taken their 'second papers' and the native-born of one or both parents born in the given country, as recorded in the Census of 1910. Provided, however, that the maximum number in no case shall be less than 1,000, in order that immigration from new countries shall not be unduly restricted." He supports the contention that no alien should be permitted to enter this country without being eligible to citizenship.

That this exhaustive treatise, written from another standpoint, should be in such substantial agreement with Dr. Gulick's book, and that the final practical recommendation in both should find favor with an unsympathetic critic like President Benjamin I. Wheeler, are facts worth pondering over. If the country gives Japan a substantial cause of grievance, the result will be disastrous, not only in chilling the friends of representative government who are at present waging a hard struggle in her assemblies, but also in stimulating the already too aggressive military party.

A RUSSIAN SOCIALIST ON THE WAR.

La Russie et la guerre. Par Grégoire Alexinsky. Paris: Librairie Armand Colin. 3.50 fr.

Gregor Alexinsky, already known to English readers by his "Modern Russia," is a leader of the Russian Social-Democrats, that is, of a party by principle opposed not only to wars between nations, but to any emphasis on national boundaries, a party that aims to unite the proletariat of all nations in a war against international capital. He is, of course, a fervent opponent of the Russian autocracy. Yet in this book he defends the justice of the Russian cause and looks forward with exultant hope to the triumph of the Russian armies. Hence his discussion often faces both ways: the Social-Democratic Deputies in the Duma showed fine attachment to their principles when they declined to vote for the war credits, but the Russian workingmen have been nobly guided by patriotism rather than by the foolish advice of "intellectuals" who wished for the defeat of Russia as a means of furthering revolution within its borders. When Alexinsky speaks of the Russian masses as "preserved from revolutionary hysteria by their political conscience and the sureness of their instinct" (p. 217), he copies the accents of the reactionary League of Russian People, whom he detests.

Despite this wobbling attitude—perhaps rather because of it—Alexinsky has done the world a service by this book. Russian political parties are not so well known to us as those of England, France, and Germany, and Alexinsky gives a clear idea of their behavior during the present crisis. Stating frankly his own position, he lets us see the power of tendencies in Russian life for which he has not even tolerance. His plea is simple. After its defeat in the Far East, Russia took renewed interest in Balkan affairs, but did not adopt an aggressive policy. Not to speak of Slavophile sympathies for the small Balkan states, Russia was bound to resist any steps towards Germanic domination of the peninsula. If Constantinople should ultimately fall under Germany or Austria, Russia's market for her grain could be entirely cut off in time of war, since the Baltic is commanded by the German fleet. The war, once begun, should be supported—and, with small exceptions, is supported—by all classes of Russian subjects. A German victory would check Russian economic progress, making the country fatally dependent on Germany, and would thereby hinder the revolutionary movement. It would be a blow not only to the Russian government, but to the whole Russian people. A revolutionary outbreak accelerated by foreign disasters, like that in Russia after the Japanese War, risks being weak and abortive.

Nor would a defeat of Russia be of benefit to the subject peoples now oppressed by the Czar's officials. Despite varied currents of opinion, Little Russians, Poles, Letts, Jews, and Armenians have all in the main been loyal to Russia. One reason is indicated by a quotation from a Lettish writer, whose people have had experience with both sorts of rulers:

> The Germans oppress in a manner that is systematic and thereby always efficacious. Moreover, their haughty contempt for all that is not German, and the logic and sangfroid with which they carr . their persecutions wherever they domin nake them intolerable. The Russians a . less consistent by nature, their spirit is not so well disciplined, they are guided more by the heart, and are therefore less to be feared as oppressors. Sometimes they strike cruel and painful blows, but they also occasionally relent. They are more rude and brutal in their manners, but at bottom they are more humane than the Germans, who often hide under a perfectly courteous exterior designs inspired by a ferocious hatred. (Pp. 196, 197.)

The Russian Government has promised autonomy to the Poles, and one may trust that advanced public opinion, aided by the influence of England and France, will make it keep its word. Meanwhile, despite some wise measures, like the suppression of the liquor traffic, the authorities have not even tried to conciliate public opinion by a political amnesty. When in control of Galicia, it is asserted that they immediately began a persecution of the Ruthenians. For a reversal of all this Alexinsky can only hope. Bad as the present Russian Government is, it deserves support, since its defeat would be a calamity for the people as a whole. Whether or not one agrees with Alexinsky's theories, one must admit that he views the situation in a manly way. His summary of his position suggests rather a romantic poet than a Marxian materialist:

> The young Russian armies are defending the cause of European democracy and of human progress. But they are under the command of a senile autocratic power. It is a misfortune for us Russian democrats and revolutionists that the military forces of our country are in the hands of the Tsarism. But for the democracy of Europe, for the peoples of Serbia, Belgium, France, and England, it is fortunate that millions of Russian soldiers will offer until death a tenacious resistance to the aggression of Germany and its allies. Truly a tragic contradiction!
>
> How can this contradiction be explained away?
>
> I find a simple and complete answer to this difficult question in a letter written by a Russian to his son, fallen on the field of battle:
>
> "We shall not live for ever in this world. What is the existence of a human being? A drop of water in the ocean of life of our glorious Russia. We shall not exist forever, while she must have a long and prosperous life. I know that we shall be forgotten, and that our happy descendants will not remember those who sleep in soldiers' tombs—but what does it matter?" (Pp. 361, 362.)

An English edition of this book, translated by Bernard Miall, is announced (Scribner; $3 net).

Drama

"THE ROAD TO HAPPINESS."

After a run of two years about the country, "The Road to Happiness" has come to New York with William Hodge, who is remembered for his success in "The Man from Home," in the principal part. When the work of Mr. Hodge is disposed of, little remains to be said, for the play, though fortified by several other picturesque types, is obviously built around him. The piece cannot be called a play at all, even if it provides a fairly amusing evening's entertainment, since the plot, except for a few minor workings, can be guessed in advance, and since rather arbitrary control is assumed of the action so as to keep the hero always on top. This Jim Whitman, whom Mr. Hodge impersonates, is a young carpenter, living in a farming community, who is blessed with ambition and sterling commonsense. It is the salt of his wisdom which makes the play what it is, for it has plenty of opportunity to precipitate itself in this community of bigotry and selfishness. As may be suspected, the entire village takes on a different aspect before the final curtain, as a result of the lessons in genuineness and tolerance which Jim has taught. Incidentally, mention should be made of one of the stage appurtenances—a big, fat hen, which perches throughout one act on a rafter in Ben Hardcastle's barn. Whereas, for a time, no play could be given without a shooting scene, and later, without a drug fiend, the present sea-

son in New York is marked by an array of live stock. This play has the hen, a dog, and a horse; another puts much reliance upon a "rooster" and two dogs. F.

"COMMON CLAY."

It is not too much to say of this play that it might have been written by Sir Arthur Pinero, not a very good Pinero, the Pinero of, say, "Letty"—a play which deals in a strong, but rather unfinished, way with the temptations of a working girl. Both pieces present only the common stock of knowledge concerning the fundamental social wrongs inflicted on girls who are left unbuttressed by the courtesies granted to girls more fortunately placed. Both make much use of the same device in order to sharpen the contrast of the high-born and the lowly—the continual reminder given the hero by the heroine that the respect which he shows his sister is not granted to her. Both plays, too, throw a silly moral sop to the audience, though here it must be said that Mr. Cleves Kinkead had more justification than Sir Arthur, for he at least grants his heroine the chance for which she has always longed, namely, to wear finery. Nor does the resemblance end here. The emphasis which is placed, satirically, upon respectability and the privileges of a gentleman is Pinero's special brand—not Shaw's, not Henry Arthur Jones's. Certainly it is not the variety exhibited in the plays of Clyde Fitch.

The question of imitation need not be pressed to the point of making the imitation deliberate. It is enough to say that Mr. Kinkead must have heard the work of Pinero analyzed by Professor Baker, under whom he studied at Harvard, and that the play, though arresting, does not give the impression of being very original. It is not even American in flavor, except for certain business, notably the court-room scene, which it shares with other productions seen in New York during the past year or two.

The main situation may be stated more explicitly. Ellen Neal—a character impersonated with admirable sincerity by Jane Cowl—after an indiscretion committed with a man about town, determines to earn an honest living, and engages herself as housemaid in the fashionable Fullerton ménage. Here, as the curtain rises on a retiring-room during a ball, she is confronted by the intoxicated Coakley, the man who had caused her downfall. By him her past is revealed to Hugh Fullerton, a pampered son just home from college. Though Hugh is not the brute that Coakley is, he, too, is a "gentleman," and is not averse to leading a "man's life"; and though he means to treat Ellen fairly, it is evident at the close of the first act that she will yield to his passion. At the beginning of the second act Ellen is the mother of his child, and he is back from Europe, expecting to be confronted by the courts, for she is determined that her son shall have the advantages which he would have had if she had been legally married to Hugh. Here enter Judge Filson (John Mason), an old friend of the senior Fullerton, to whom the latter has gone for legal advice. Coakley has been brought to the Judge's office to remind Ellen of her first offence, but has the tables turned on him when Ellen's lawyer decides to prosecute him for having seduced the girl prior to the age of consent provided by the law.

The following act, which takes places in the court-room, is the "big" one of the play. It provides Miss Cowl with an opportunity for some excellent emotional acting when, stripped of her self-respect by the searching examination of Judge Filson, she in turn is lashed by her conscience, and is spurred on to upbraid society for its hypocrisies. A powerful climax is contrived by the admissions on the stand of Ellen's supposed mother that her real mother was the woman whom years ago the Judge himself had wronged. This disclosure had been so carefully prepared for by the author, who evidently wished to play fair with the audience, that to some, at least, it came as no surprise. Yet it must be admitted that the surprise is not of so much moment to the audience as is the chance to study its effect upon the Judge. In the hands of a competent actor like John Mason, the situation was rich with dramatic interest. Yet we must regret that Mr. Mason has acquired that easy American accomplishment of talking through his nose. At this juncture the play should have ended, with only the hope held out of a subsequent union with Hugh. But an epilogue there is, and everything is happily arranged for in the presence of the audience. F.

"THE HOUSE OF GLASS."

Mr. Max Marcin, the author of this play (Candler Theatre), has reverted to a dramatic type which was the usual thing in the days, not long ago, when the stage attempted to "show up" political bosses, police sergeants, captains of industry, and others like them. Those were the days of muckraking, and playwrights and audience alike forgot that an essential of sound drama is the portrayal of human beings. It was enough that the young writers were dealing with vital problems and were supposedly battling against the devil in an ingenious way. Mr. Marcin, too, has plenty of tricks in his kit. There are moments in this play when the audience holds its breath at thought of what is coming, but it is enough to say that the final impression given is one of dummies skilfully manipulated, and this in spite of some very good acting.

The theme on which the author hammers is naturally one which is uppermost to-day. We guess that it was suggested by the work of Mr. Osborne at Sing Sing. In any case, the play sets forth the alleged iniquities of placing a lasting stigma upon any one who has ever served a prison sentence. The story is ingeniously contrived, so as to keep the audience entirely clear about a complicated situation; yet to do this it has been necessary to make of the first act what is essentially a prologue. A stenographer has fallen in love with an attractive young fellow, and after an acquaintance of just two weeks is preparing to marry him, when he is arrested in her room on the charge of burglary. Certain jewels which he has left with her implicate her in the crime, and in spite of the fact that she is entirely innocent, she is sent to prison for three years, after half of which term she is released on parole. But shortly she breaks the parole and runs off to Kansas City, where she is seen after a lapse of eight years the happy wife of a prominent railway magnate. The latter naturally gravitates to New York, the scene of his wife's former troubles, and then begins the working out of the real dramatic interest of the piece. The husband, now president of one of the big railways, is relentlessly prosecuting an employee who has stolen from the company. All manner of influence exerted in the boy's behalf leaves him cold, until he learns from his wife's lips the story of her career, and the fact that a detective is bent upon getting her back in jail on account of the broken parole. Here is a situation which, *per se*, is powerful, but the author's characters are only so much invention, and he has also made them frightfully talky—a combination of defects which the excellent acting of Frederick Burt, as the husband, of Harry C. Browne, as attorney, and the uneven, but on the whole good, work of Mary Ryan as the wife, are unable to cope with. F.

Finance

LONDON AND THE NEW YORK MARKET

Having fallen on Wednesday of last week to $4.50 in the pound sterling—no less a depreciation from the normal parity than 7½ per cent.—the rate of exchange on London recovered violently. Before the close of the week, it was back to $4.71½, having retraced the downward steps, not only of last week, but of the week preceding. This advance still left the rate far below normal, but it indicated that influences bearing on the market do not all operate in one direction. For one thing, the British Government's fiscal agents at New York had in their hands, last week, $60,000,000 worth of American securities sent over from London on warships during August. It is practically certain that loans were raised in Wall Street on the collateral of these stocks and bonds, and the proceeds used to pay maturing claims against England in this market, without drawing exchange on London.

Simultaneously, it became known that the financial commissioners, sent from London to arrange for such operations on a larger scale, were already on the way. The market for exchange remained highly irregular and excited; but the course of rates reflected the financial community's feeling that last week's extreme decline took too many things for granted. Nevertheless, discussion as to the outcome of so bewildering a situation in international exchange continued, and with wide diversity of judgment. Would it be possible, after what has already taken place, for England to raise the much-discussed $500,000,000 loan in the United States, from the proceeds of which the manufacturers of munitions could be paid? If such a credit were established, would it be large enough to offset the pressure on exchange?

Opinion, even in conservative quarters, found itself in agreement on neither of these questions. Yet they can at least tentatively be answered. The answer to the question as to a $500,000,000 "New York credit," is that England can unquestionably raise it, but that the terms will be

exacting—chiefly because of the long delay in grappling with the question. Our own Government, just twenty years ago, got itself into a similar scrape, through a similar procrastination. Our supply of gold was being exhausted through export to meet the abnormally adverse exchange rates.

In the end, the Government of 1895 had to apply to international bankers to establish a London credit, and to pay for it we had to sell Government bonds at a net rate of 3¾ per cent., when 3 per cents had been sold at par a few months before. England, too, will probably have to pay a considerably higher rate than her latest war loan bore; she will have to forego the income tax on the bonds thus issued; she will have to guarantee interest payment in dollars, and she may be asked to put up security collateral. On such a basis, certainly $500,000,000 could be raised. Had the negotiations been opened six months ago, the thing could have been done without collateral. But the present attitude of our banks towards the operation is clearly due to misgiving caused by the random talk of "British credit" which has accompanied the spectacular break in sterling exchange.

Whether $500,000,000 would be more than a temporary stop-gap, is a question which cannot be answered, unless one knew how long the war will last. But if exchange rates could be restored to something like normal figures, another borrowing, if necessary, would be far more simple. It was so with our Government after the episode of 1895. For when the immediate crisis in exchange had been averted, through the London operation, and the outflow of gold had been held in check during a series of months, confidence was so far restored that a new and very large loan, offered in New York city, drew heavy subscriptions from European investors.

If England were to encounter difficulties in the operation, would her investors sell the rest of their American securities? On this point, also, widely opposing views exist in the most experienced quarters. Among such holders of our stocks and bonds, there are investors who wish to snatch the abnormal profit on exchange, and there are investors who wish to shift their funds into British war bonds. But there are also investors who believe in keeping a reserve investment in a neutral state, or who regard American securities as attractive, because of the country's present immense financial prestige. Even among English financiers and public men, some would urge or compel such sales, in order to regulate exchange; others regard American securities as an anchor to windward which London ought to hold.

It is largely a question of duration of the European conflict. If peace were to return within the space of a few months, England would probably still retain something like a thousand millions of our stocks and bonds. But if the end of a protracted war were to see them nearly all back in American hands, yet sustained in value here by the new resources of our plethoric money market, the economic outcome would be logical.

All things considered, it would appear to be at least conceivable that the "gold inflation theory" and the "foreign liquidation theory," pointing individually to opposite results on the Stock Exchange, might result, when operating jointly, in a happy equilibrium. And meantime, it remains to be seen whether England, by the pledge of her private or governmental credit in our market, will not manage to solve, for the time at any rate, the problem of exchange.

Everyman's Education

A Message to Teachers and Parents

TEACHERS of large vision are realizing that they have not done their full duty when they lead their students through the prescribed text-books without also showing them the way to an intimate acquaintance with the best literature on the subjects chosen for class-room study.

Parents who have at heart the best interests of their children are taking greater pains to encourage them toward the reading of intelligently selected books, to round out and make most effective the work they do in school hours.

Few schools can maintain an adequate library. At best their shelves contain only a single copy of each book. Besides that, only a small proportion of the average class can afford to buy the expensive volumes that would necessarily be recommended.

That is the thought that prompts this message to readers of the Nation.

For the first time a library has been created which makes the world's greatest literature available to schools and colleges, in a form and at a price suited to text-book purposes.

Everyman's Library, perhaps the greatest single undertaking in the history of book publishing, is widely recognized as a boon to educators.

For the small sum of Thirty-five Cents a volume, this library, with over seven hundred titles, has placed standard books, good books, well printed and well bound books, well edited and capably translated books within the reach, not only of "everyman," but of *every child* and every school.

Here is provided, at a minimum cost to the teacher or student, a list of the best standard texts from all the world's store of literature.

Everyman's Library is under the editorial supervision of Professor Ernest Rhys, with whom are associated many famous educators, authors and literary critics.

Among them are such men as Professor George Baker of Harvard, Hilaire Belloc, Anatole Le Braz, James Bryce, G. K. Chesterton, Austin Dobson, Edward Hutton, Alfred Noyes, Brander Matthews, Hamilton Wright Mabie, Professor Barrett Wendell, Arthur Symons and many others who stand highest in ability and authority.

CO-OPERATIVE EDUCATION

Such editions of the most desirable works have never before been offered to schools at so low a price, or with so wide a field of choice.

Free for the asking.

The achievement has been possible because of the great extent of the undertaking, and the fact that it is a co-operative enterprise between a great publishing house and the educational interests of the country.

The teachers of today recognize the value of carefully selected reading as a supplementary method toward the best educational results.

The teacher wishes the student to realize clearly that the study of English, or History, or Science, is not merely a class-room task. The successful teacher is the one who finds a way to make the student *enjoy* the books he is studying. To that end the publishers of Everyman's Library are seeking a closer relationship with teachers everywhere, in order that real assistance may be rendered in the arrangement of their courses and the selection of the most desirable texts for collateral reading and study.

The Service Department of Everyman's Library therefore invites letters from any teacher or parent who is interested and wishes suggestions as to the best courses.

A series of lists have been prepared which indicate the various groups of books most suitable for use in any particular branch of study. These will be gladly furnished without charge.

To meet this same need the publishers will send to any Nation reader who uses the attached coupon:

A VALUABLE COMPLIMENTARY VOLUME

The Dictionary Catalogue of the First 505 Titles in Everyman's Library, arranged and annotated by Isabella M. Cooper, of Simmons College, and M. A. McVety, of the Newark Public Library, charges prepaid, bound in serviceable cloth and printed in type similar to that used in the Everyman's volumes. This book will be found very useful for reference, giving much detailed information about books and authors. A complete list of the Library will be sent in the same package.

TEXTBOOKS AND THE STATE.

The importance of textbooks as an element of our educational system may be gauged from the fact that we spend upon them no less than two-thirds as much as we spend upon chewing-gum. Yet the $17,000,000 thus invested is but 2 per cent. of our entire bill for education. For each pupil in the public schools, the cost of books is on the average 78 cents a year. A negligible item! An item, at least, so small in the total budget that the only question likely to arise in connection with it is whether we are getting in our particular school the best books on the market. So one would reason who was guided solely by the figures. The facts are far otherwise. So large does the cost of textbooks appear in the eyes of legislators that they are influenced to take one or both of two lines of action regarding them. One of these is to furnish such books to pupils free. This movement seems to be gradually spreading over the country. Maine, for instance, compels her towns to provide free textbooks, but the local school committee may contract with publishers as to the price for the books sold to parents who wish to pay for them. In Minnesota, the district board may provide free books or sell them at cost. The direction in which this regulation looks is indicated by the further provision that the question of free books must be voted upon, if as few as five persons request such an election.

The other line of action towards which legislators are occasionally influenced by their view of the cost of textbooks is to place the choosing and printing of these books in the hands of the State. This movement has never gained great headway, but now and then it appears in a new capital. Alabama is considering this step, as Georgia, Kansas, and California have considered it before her. Two years ago, Georgia appointed a Joint Legislative Commission of eight to investigate the subject. This Commission reported adversely to the project, and the matter was dropped. The same winter, Kansas created a State School-Book Commission, with power, among other things, "to purchase necessary machinery, type, and other printing and binding material, to print and bind school books, to procure copyrights for same, or to contract for the right to publish said school books, on a royalty basis, and to provide for the preparation, publication, purchase, sale, and distribution of a State series of school textbooks at cost, making appropriations therefor." In accordance with this law, a "History of Kansas" was written by a county superintendent, and its crudities were ironed out by one or two professors in a higher educational institution of the State.

But the point upon which stress is always laid is not the quality, editorial or mechanical, of books published by the State, but their low cost. The "History" was sold for 22 cents, a book of literary selections for 18 cents. Did the State come out ahead, or did it not? The answer is that nobody knows. As is usual in balance-sheets of State-made articles, no account is taken of elements of cost that are included in private estimates as a matter of course. A State is above taking notice of "overhead charges." Why should it trouble itself about interest on the investment, depreciation of plant, even salaries, storage, insurance, postage, and so on? Kansas has invested $230,000 in this venture. The interest on this sum at 6 per cent. would amount to $13,800 annually. It is obvious that the omission of items like this renders any estimate of cost almost valueless. The one thing certain is that whether she paid more to private publishers than she is paying now, at least she knew how much she paid then, and she does not know now. As the difference at most cannot be more than a few cents on each book, she would appear to be paying dearly for the privilege of making her own whistle. Towards this conclusion, she herself seems to have been driven, for the Legislature of 1915 amended the law in several important respects. It now directs that the Commission shall provide by adoption for such books as they may "find it impossible or impracticable to print or publish." It also abrogates a stupid provision in the law of 1913, which prohibited the use of supplementary books!

The only long trial of the plan has been made by California. For twenty-eight years, from 1885 to 1913, that State actually appropriated money to pay for publishing textbooks—and also charged for the books! It occasionally introduced a variation into this system by making special appropriations for its publishing plant. In 1913 it came to the conclusion that if the State taxed itself for the books, it ought not to have to pay for them a second time, and provided that textbooks should be free. Of this experiment, one thing can be said with confidence: it has cost the State money rather than saved it money. The mere fact that parents paid for their books twice is suf-

ficient to establish that. These books were sold at about the prices asked by private publishers for books at retail, and yet the sums thus received by the State were not nearly enough to reimburse it for publishing them. The first set of texts was sold for double the price at which the State Printer had estimated that he could produce it. Now that California has gone the whole length by printing and distributing her textbooks free, she makes her appropriations with a more lavish hand. Up to 1913 the appropriations, direct and indirect, for publishing these books aggregated about $800,000. In February, 1913, the Legislature appropriated "for the purpose of paying expenses of publishing State textbooks and distributing the same free to the school children of the State" all the money then in the State school-book fund, amounting to $156,000. In June it made an additional appropriation of $500,000 for the same purpose. But unless a radical change in methods of accounting is made, California will still be far from a knowledge of what her school books are costing her.

But the item of expense, large as it looks to the legislator, is in reality the smallest element in the question. What are a few cents, or several cents, when the quality of a textbook is at stake? Yet this element of quality apparently never enters into a State's consideration of the matter. It seems to fear that it would be reflecting upon its own educational efficiency if it were to admit that its textbooks ought to be written by outsiders. The instinctive method of procedure is to get hold of a more or less prominent local educator who will not charge too much, and set him to work turning out the volume. No law to this effect need be written on the statute-book; local patriotism will be sufficient. One or two States, nevertheless, that are not doing their own printing, to make assurance doubly sure, have inserted something in their laws to that end. Louisiana definitely instructs her State Textbook Commission to show a preference for Louisiana books in their adoptions. Even if the resort to State printing were not so much a thing of politics, engineered by politicians, administered to too great an extent by politicians, the temptation to exploit local talent in the writing of textbooks would still be strong.

Now, textbooks lie very close to the centre of our system of public education. Teachers lean heavily upon them. They should, therefore, possess two features that only the expert can rightly give them: they should be authoritative, and they should be teachable. The qualities of scholarship and pedagogical ability are not always united. On the contrary, they are rarely found together. Who is going to seek out the proper person to write a book that must be at once learned and simple, sage and plain? Kansas proposed to manage it by having her Commission select, outside of its own membership, a secretary, who should be a textbook expert as well as the executive officer of the Commission. His salary was not to exceed $2,000 a year. This was as if a State should make an agreement with a publishing house to buy all of its textbooks from that one house, and to choose a house that did not pay its best textbook expert more than $2,000 a year. For the sake of saving a few cents on a book, which it might or might not, in the end, save, it surrendered its privilege of selecting from a score of finished volumes, produced by able and experienced concerns, the one best suited to its purposes.

It is not to be denied that private publishers have been somewhat to blame for the itch of State textbook publishing. The competition among them not many years ago was so keen, their methods in some cases were so shady, that not only politicians, but well-meaning folk, were tempted to ask themselves whether there must not be huge profits in a business that could support such extravagant methods of unloading its product. There is no doubt that now and then bribery was tried, sometimes successfully, by a house too eagerly bent upon getting its books into the schools of a city or a State; on the other hand, a politician would occasionally hint that the privilege of supplying textbooks was one that could be bought, like the textbooks. But one hears little of this sort of thing now. Competition is still keen—too keen to give substance to the idea, prevalent in certain localities, of a "school-book Trust"—but ordinarily it is conducted in a way to leave the question of State publication to be decided upon its merits. The general tendency of States to adopt uniform texts may have encouraged in one or two of them the idea of doing their own publishing, since uniform texts mean fewer texts. But this fact points in reality in the opposite direction: a private publisher who receives a contract to supply one or more texts to an entire State for a three or five-year period can name a price which takes away the argument of economy, to say nothing of the more important element of quality.

The State-University Idea

By WARNER FITE.

In Eastern newspapers of a more progressive type one hears occasional echoes of that peculiar reverence which is paid in the West to "the State-university idea." At the same time one may detect a growing willingness, not to say eagerness, on the part of Eastern universities for a closer relation to the State. Remembering the resources of the State as a patron of education and the huge appropriations which are sometimes granted to State universities, this willingness is not wholly surprising. But the grounds urged for "the State-university idea" are of a different sort. The State university is supposed to represent the final and logical type of scholastic institution, by the side of which the private, or corporate, university is an inheritance from an unenlightened past, before education came to be regarded as a social function. And in this country the State university is the special representative of "democracy." The picture is drawn of the private institution as administered by the financial interest, the mouths of the professors closed by the fear of disturbing vested interests, while the State university, owing allegiance to none but "society," enjoys a complete freedom.

No comparison could, I believe, be much further from the facts. It is true that our State universities have been on the whole remarkably free from "politics," in the sense of party politics. But no one who remembers how State institutions in general are administered in this country could expect them to be free from more or less corrupting personal influences. I have known of one State university whose policy was absolutely controlled by one member of the board, supposed to be the wealthiest man in the State; so much so that none of his colleagues ventured to suggest a measure without first learning his wishes. It was only by the grace of God that he was indifferent about the educational policy. Another institution might be named which some time ago was granted a large increase of income. A lively public campaign preceded the grant, and it was followed by mutual felicitations. But every one knew that one step alone had been responsible for success: a representative of the university had called upon the political boss of the State, a man known far and wide as an infamous politician, and had been successful in obtaining his favor. This does not mean that any promises of support were given. But one is obliged to wonder how far a member of the faculty of that institution, in his capacity of citizen of the State, will be at liberty to indulge in public condemnation of the politician in question, and how far his position is superior to that of the professor whose salary comes from "tainted" private wealth.

And if the State university is free from party politics, it is not free from the politics of local interest. From the standpoint of the university town, the university is mainly a

source of trade, the town's share in the favors bestowed by the State; the town is therefore interested in the material prosperity of the university. This brings about a community of interest which is scarcely less corrupting than party politics, and which subjects the university to a preponderating influence in its affairs on the part of a local, and not seldom an ignorant, community—for few of the State universities are situated either in the capital or in the largest city of the State. And as for any other community of interest, if we imagine the university suddenly taken up and carried away, like Aladdin's palace, it would often be difficult to determine, from a study of the habits and modes of thought of the townspeople, whether the gap had been filled by the State university, the insane asylum, or the State prison.

Nor are we to imagine that "the State-university idea" stands for any special immunity from religious prejudice. It has been customary in State universities, no less than in denominational colleges, to question a candidate for appointment concerning his church connections. Any church connection will do. But in the small Western towns a man with no church connection is apt to be looked upon askance, especially if he refuses to apologize for it; and in the town society a family without church connections is considered hardly respectable. This means also that the code of personal morals which the candidate is expected to follow is apt to be somewhat narrowly Puritanical. I recall one State university professor who told me, rather sadly, that while his colleagues in the denominational colleges could drink a glass of beer when so inclined, he himself was obliged to pose as a total-abstainer. To those who are familiar with the history of State universities his story will be not wholly incredible. The State universities have had to face a steady fire from the denominational colleges, which, on grounds purely theoretical, connected with the separation in this country of state and church, have loved to denounce the State university as godless and immoral. The State university is therefore compelled to make a double show of piety and morality.

It would be historically incorrect to say that the State university has been *made* in Germany. It is a fact, however, that State universities have grown to their present dimensions during a period in which our conceptions of higher education have been dominated by German influences. And there can be little doubt that the German conception of the organized State underlies the thoughts of those who are impressed with the beauty of "the State-university idea." The State university is conceived to be the logical head of the educational system of the State. Ideally, it should consist of a body of educational experts—efficiency-men—who would control the educational system of the State from top to bottom. And not only the public system. They would also formulate the standards to which all private, or corporate, institutions would be obliged to conform. Nor is this all—indeed, it is a small part. Following "the Wisconsin idea," the object of envious imitation in State-university circles, the university would provide authoritative experts for all departments of life. No laws should be made without consulting them, and nothing would be too trivial or too secular for their attention. In the full realization of "the State-university idea" we should see a State made happy and prosperous by authoritative academic wisdom.

From the standpoint of "social efficiency," the beauty of the idea is perhaps indisputable. But there may still be some Americans who wonder whether social efficiency, so called, is a complete test of social excellence, and whether America free is not more desirable than America efficient. Just at the moment we have a rare opportunity of studying the fruits of social efficiency in Germany, the land where the State-university idea has achieved its finest realization; and where, on the part of university professors, a miraculous uniformity of sentiment (coupled with a devastating diversity of argument) is illustrating for us the ideal of academic freedom. Some time ago the *Nation* printed an article on the recent difficulties of "the State-university idea" at the University of Wisconsin, in which the writer dwelt somewhat upon the fickleness and stupidity of a character named Demos. I am unfamiliar with the Wisconsin Demos, but from certain expressions of "the Wisconsin idea" in other places, I am led to suspect that Demos found the idea too much for him. Some time before I had had the pleasure of reading a public circular in which another State university, unhappily not provided with a department of dairying, undertook to enumerate the services that could be rendered the State by other departments. Among others, the department of public speaking could assist the State in the discussion of public questions—the department in question consisting of one bachelor of arts of two years' standing. One may hazard the guess that Demos does not wish to be assisted in the discussion of public questions.

Nor is it at all clear that the alliance with Demos is favorable to the higher interests of the university. State universities in this country have not thus far been distinguished either for an atmosphere of culture or for disinterested scientific achievement. And in the appeal to Demos little or nothing is said about the leavening influence of the mere presence in the State of a body of cultivated men. While large sums have been extracted from Demos for the general uses of the university, more or less by a resort to lobbying, the argument has been based chiefly upon corn and cows; and Demos, while paying for corn and cows, has unwittingly contributed to culture. It still remains to be seen how far Demos would approve of the broader aims of the university—for liberal scholarship, for disinterested scientific research, and for the cultivation of the humanities—if these items were specified in the bill.

And if Demos should object, it would be hard to say that he would be altogether wrong. If Demos is to pay the bill, why should he not be the chooser of the goods? Now, Demos is by no means a brute. He may be mainly interested in corn and cows, or in trade, but he is always pleased to see his son become a finer and more capable man than himself. He is not quite satisfied, however, that all the apparatus of the State university is necessary to this result. If he forms his idea of the university from the daily press, he will judge that it is primarily occupied with the promotion of athletics and social events. And if he makes a visit to the university, he may be led to think of it as mainly an institution where men of intellectual tastes may pursue their favorite avocations at public expense; or where a set of youths, by no means conspicuously superior in natural ability and taste to their brothers who are working every day and all day in offices and stores, are enjoying independent leisure. Granting that he gives the university full credit for serious intellectual work, he may still be pardoned for wondering how much of it is useful to Demos. It is all very well to tell him that leisure and independence are necessary to culture; that the independent pursuit of culture and learning is an advantage of the State; that these tend ultimately to raise the standard of living, to refine the habits and the morals of men, and in the end to add to the general prosperity. This may be evident enough from the point of view of the cultivated man, though even for him it will be more or less an article of faith. Demos inevitably—and one may say, rightfully—looks to more immediate and tangible results.

A sense of the incompatibility between the point of view of Demos and that of the more scholarly aims of the university is bound to have, and does have, a certain benumbing influence upon the policy of the State university. Whatever the ambition of the university in the direction of a liberal as opposed to a practical culture, it is the practical rather than the liberal that must be put forward when dealing with Demos. The inevitable result is that men who are pursuing the more practical studies come to feel that they have a more securely vested interest, while the others may be led to doubt whether they have any right to their places. The professor in the State university is obliged to remember that he is the servant of Demos. As a high-school teacher of history or of science, he might easily satisfy himself that he is giving Demos not only what is good for him, but what he would gladly pay for. As a university professor of higher mathematics, or of Romance literature, or of philosophy, he may have ground for doubting whether Demos would pay the bill if left to himself, if he does not also doubt whether Demos has any real use for the goods.

The truth is that the idea of the State university is not so logical as it seems. Its logical completeness is marred by an internal disharmony between the useful and the noble which it shares with all of life. "The

State-university idea" assumes that higher culture may be supported by an appeal to common interests. But common interests are inevitably, if not also justifiably, more or less utilitarian; and no argument based upon common interest will ever quite convincingly justify the finer works of the spirit. In the history of culture spiritual advancement has been founded, not upon common needs, but upon a certain freedom from those needs which is to be described generally as "leisure." It may well be that the fruits of leisure include an increase in general prosperity, but no cultivation of the spirit based upon the need of prosperity will yield the ripe fruit. The flight of the spirit presupposes surplus energy, or at least a freedom from common cares. If the imagination of the scholar or of the man of science is to work freely, he must be absolved from any immediate responsibility for tangible "results." And if an institution of learning is to feel free to adopt a liberal programme of thought and of research, it must be supported by surplus wealth. Higher thought and learning are in all senses of the word speculative. So far, then, from discovering any absurdity in the support of higher education by private wealth, as contended by the advocates of "the State-university idea," we may, on the contrary, discern a special fitness in the idea that *liberal* education should be supported by free contributions and not by a tax upon common needs.

Yet I have no wish to urge that the State university is itself an absurdity. The State university has doubtless come to stay; and in the modern state it is bound to fulfil an increasingly important economic function. Nor is there any reason why it should be bound by economic restrictions as long as Demos is willing to pay the bill. My point is rather that the endowed institution, so far from requiring an apology for its existence, possesses a special advantage. There is no reason why all institutions of learning should be of the same type, have the same curriculum, or conform to the same standards. And it is mere socialistic nonsense to suppose that an institution which lies outside of the political system performs no "social function." The endowed university enjoys an invaluable freedom. Donors may sometimes be exacting, but at length they die, while the Legislature goes on forever. No Legislature can be counted upon to respect academic tradition. The State university is likely at any time to have its income reduced, to be placed under foreign control, or to be subjected to conditions wholly at variance with academic ideals. The endowed university is mistress of her own policy. While not free from public responsibility, she is free to resist popular prejudice. If she will exercise economy and choose her own course, she can in most cases wait for gifts to come to her. As the representative of a truly academic freedom she performs an important social function, and any endowed university seeking the protection of the State is parting with an invaluable birthright.

Hittite Greek

IMPORTANT CORROBORATION OF THE DISCOVERY OF THE GREEK CHARACTER OF HITTITE.

By GEORGE HEMPL.

There have recently come to my knowledge certain texts that throw clear light upon the problem of the affinities of the Hittites, whose empire extended over Asia Minor, Syria, and northern Mesopotamia, and was at the height of its power during the second millennium before Christ. This new evidence is such as will doubtless be appreciated by scholars generally, as well as by philologists. I therefore venture to avail myself of the columns of the *Nation* in order that I may call attention to the significance of these texts, preliminary to treating them in detail in a professional journal.

Three years ago I succeeded in reading certain Hittite documents. My first report on the subject was made in a paper read before the Philological Society of the Pacific Coast, in November, 1913, and published in the last volume of the "Transactions of the American Philological Association." In this I showed that Hittite was Greek, and that, while the dialect of the early Hittites was Javonian and closely akin to the later Greek of Attica, the Hittite empire was conquered about 1400 B. C. by Dorians, the official documents of the new dynasty being in a form of Doric. This Doric differs from the Doric hitherto known to us, not only in being much older, but also in having had a long independent development. Like the Doric we already knew, it reveals an accent that stands one mora farther on in the word than that of other Greek; it retains long *a*, where Javonian Greek has long *e;* it often shows *s* for *th;* it employs such forms as *enti* for *esti,* and the pronouns *(e)min, (e)tin, sin/hin.* On the other hand, it frequently omits pretonic and initial unaccented vowels, and even syllables, thus betraying stress accent; it simplifies *st(e)r* to *s(e)r;* it usually drops final *-s* after a short vowel if no initial vowel follows; it treats final *-n* similarly, or changes it to the cognate *-r;* and it has infinitives ending in *-wor/-mor* and *-or,* which represent *-mon* and *-on,* the gradation mates of Doric *-men* and *-en.*

When I published my report, the Hittite material which I had at my disposal was limited. Recently I have got access to transcripts of numerous Hittite cuneiform texts and find my earlier conclusions fully confirmed. I have not, however, deceived myself into assuming that the careful interpretation of even a considerable number of Hittite texts would soon convince the philological world of the nature of the language. There are various reasons why this should not be expected. It was, therefore, a matter of special gratification to me when I discovered a few weeks ago that Professor Delitzsch of Berlin has edited (in the *Abhandlungen* of the Prussian Academy, 1914) fragments of a set of cuneiform tablets which contain a glossary with Hittite translations of Sumerian and Assyrian words. This fixes the meaning of the Hittite words quite independently of any one's theory as to the nature of the language. When, then, it appears that these Hittite words have the same form and the same meaning in Greek, the Greek character of Hittite is automatically established. This was not observed by Delitzsch, though it is hard to understand why the obviously Indo-European character of the texts did not impress itself upon him.

I.

In order to facilitate the comparison of the Hittite and the Greek words, I shall transcribe both into Roman letters, ignoring, however, all diacritic marks other than the sign of length. The reader must bear in mind the inexact character of cuneiform writing, especially of the writing found in these provincial texts. Thus, a letter is frequently doubled to no phonological purpose, and, whether single or doubled, may represent any one of a number of similar sounds. For example, *e* or *i* or *ii* or *ie* or *ei* may spell *i, e, ē,* or *ei;* and *k* may stand for *k, g, kh,* or *q,* which last became *k, p,* or *t* in classical Greek. The nasals *m* and *n* are not always distinguished, and so the labials, *m, w,* and *u,* and the dental sonorants *l, r,* and *n.* In some cases it is still to be determined whether we have to do with inexact spelling or with phonological change, for example, of *m* to *w* and of *n* to *r.* Moreover, as there was no o in Assyrian and consequently no cuneiform spelling for it, Greek o's were spelled either *a* or *u.* It must also be borne in mind that this Hittite Greek is many hundreds of years older than classical Greek and is of the Doric, not the Attic, variety. It is hardly necessary to add that it cannot be expected that the endings will always coincide, any more than they coincide in later Greek dialects, or that the words will always have exactly the same shade of meaning.

I shall content myself in this communication with citing a few typical examples of each of the various parts of speech. The English translations that I give of the Hittite words represent the Sumerian and Assyrian words to which the Hittite words are attached. The pronouns and pronominal adverbs are in themselves sufficient to show the Greek character of Hittite. We have already observed the Hittite use of the Doric datives of the personal pronoun, but in Hittite these forms have the function of possessive adjectives, much as *mir, dir, ihm* often have in German—

Hittite *mi(n)* "my," Doric *e-min* "for me."
Hittite *ti(n)* "thy," Doric *e-tin* "for thee."
Hittite *si(n)* "his," Doric *hin* "for him."

But Delitzsch is in error in supposing that *mi,* etc., are dative possessives, and *min,* etc., accusatives, as I have made clear in my report on the Tell el Amarna texts. There are numerous examples of the *q* pronouns

and adverbs. *kuis* (p. 33) = *qis* "who"; Greek *tis* from *qis* "who." *kuid* (p. 27, Z. 22) = *qid* "what?"; Greek *ti* from *qid* "what?" *kuid* (p. 33) "how?", "when?"; Greek *ti* from *qid* "how?" *nu kuid* (p. 33) "(now) why?", "for what time?", "whenever"; Greek *ti nu*, "why (now)?" *kuussaan* (pp. 28, 33)=*qoson*, "when?"; Greek *koson/poson* from *qoson* "how much?" "how long?" Also *nu kussaan*, "for what time?" and "whenever," "as long as," that is, used relatively, like Greek *hoson*, "as long as." With these *nu*-forms compare *kinuun* "now," that is, *ge nūn*, Attic *age nūn* "well now," "now," with Doric accent and loss of unaccented initial *a-*.

As Delitzsch observed, there is also a noun spelled *kuussaan*, dative *kuussani*, which means "pay," "compensation." This is *qusōn*, for *qisōn* (compare our *cud* for *quid*), from *qitiōn*, an extension of the stem seen in Greek *tisis*, from *qitis*, "pay," "compensation," "retribution." Of other nouns I may cite the following: *zaakkar* (pp. 28-9) "storm," compare Greek *zakhrēēs*, "stormy," "violent." *khuumaan* (pp. 21-23, 24)=*komōn* "entirety," compare Greek *komidē* "entirely." *pabarrii* (pp. 15-2)=*pamphori(s)* "produce," compare Greek *pamphoria* "all kinds of fruit." *kuutti biraan* (pp. 20-33)=*kutei perān* "circumference of a dish" (Sayce), literally "around a dish," compare Greek *kutei peri*, "around a dish." *turiiaanza* "be prominent," "jut out," "what is prominent" = *turyandzo(s)*, from *turwanyos*, whence Greek *turannos*, "absolute sovereign," especially one who rose to power by irregular means, compare our *upstart*. There are many Hittite nouns with the suffix *-anza(s)*=*-andzo(s)*, from *-nnyos*. The Hittite translations of nouns are, as we have seen, not always word for word; and for this we have reason to be thankful. Thus Sumerian *agisgarra*, Assyrian *iskaru* "restraint," "that which restrains," is rendered by the interesting clause *UD.KAMas* (ideograph for "daily," see pp. 19-32) *aniiaan kuis eessai*, that is (*hēmerān pr)os aniān tis ēssāi*, "one who overcomes the annoyances incident to everyday life," that is, "one who restrains himself."

Of the adjectives I may mention the following: *aara* "good"=*aro(s)*, of which Greek *aristos* "best" is the superlative. *meikki* and *meikkaaes* "much," "large," = *megi(s)* and *megās*, Greek *megas* "much," "large." *dameeda* (pp. 29-15) "*fat*"=*dāmeto(s)*, an extension of the stem seen in Greek *dāmos*, *dēmos* "fat." *suuwaan* "strong"=*swōn* or *swoon*, Greek *s(w)oon*, "sound," "healthy." *waalkissaraas* "strong" = *wulk-is(t)eros*, Greek *(w)alk-imos* "strong," "brave," both originally superlative forms. The Hittite *w*- shows that *alkimos* is cognate with Sanscrit *varcas* "strength."

The many verbs present numerous points of interest. *appatar* "grasp," "take," "get"=*apt-or*, from *apt-on*, which is the mate of Greek *(h)apt-en*, *(h)apt-ein* "fasten to," "grasp," etc. Assyrian *zaarum* "beget" is rendered by Hittite *kuruur appatar=kōrōr aptor*, that is, Doric *kōrōn hapten*, Attic *korōn haptein*, literally "get children," with *-r* for *-n* in both words. Prehistoric *punthō* "ask," the original form of *punthanomai*, is reflected in Hittite *bunuussuuwaar* (p. 27, Z. 11), the translation of Assyrian *sa'alu* "ask." This *bunuussuuwaar* is the clumsy cuneiform spelling of Hittite *puns-wor*, from *punth-mon*, with Doric *s* for *th*, as in *sūmos* for *thūmos*, etc. The parallel *bunuus-kiuwaar*, which is used to translate *sita'alu*, the iphteal form of the Assyrian word, is evidently the perfective *k*-aorist, out of which the Greek *k*-perfect developed. This would seem to betray the perfective character of iphteal forms. In other words, *sita'alu* and *bunuus-kiuwaar* meant "succeed in inquiring," "learn," the idea expressed in later Greek by the middle *punthanomai*. The Greek perfective *ke*, which later became the sign of the perfect, is identical with German *ge-*, perfective prefix, later sign of the perfect participle. *sa[a]ki* (pp. 9-7) "knows"=*sāke*, Doric doublet of *thāke* (compare Doric *e-sāmen* for *e-thāmen*), is the active perfective form of *tha(e)omai* "gaze at," with the normal perfective value "succeed in seeing," "realize," "understand," "know." Compare the development of Greek *oida*, English *wot*, German *weiss*. *taata luuskiuwar* is used to translate Assyrian *beduu* "loosen." Of these words, *taata*, the object, is Greek *tata* "things that can be stretched," and *luuskiuwar=lus-ke-wor*, is the infinitive of the prefective *k*-aorist of *lu(s)ō*, mate of Greek *luō* "loosen." Observe also the infinitives *arnuwar* "be excited," "be angry"=*ornu-wor*, Greek *ornu-ein* "excite," *orōra* "be excited"; and *kuunnuwar* "fill up," "be full"=*khōnnu-wor*, Greek *khōnnu-ein* "heap up," "fill up." An infinitive, being a verbal noun, often occurs where we might use a noun. Thus *ar-kuuwaar=arkh-wor*, "to command," "commanding," "a command," "commands," Greek *arkh-ein*, "to command."

The adverb-preposition *anda* occurs in various paraphrases which make it clear that it means "together," "with," "because of." This *anda* = *anta*, is Greek *anta* "against," "face to face," and shows the same shift in meaning that our *with* underwent, compare *withstand* "hold out against," German *wied(er)* "against." Thus, for example, *anda tarubbuar* "collect together," in which *tarubb-uar=tarph-wor*, is Doric *traph-en* "curdle," that is, "collect into groups." Compare also the rendering of Assyrian *zitum* and *asasum* "mourning," "lamentation," by Hittite *anda gan impauwaar* and *para gan paauar* "to be agitated with grief." Here both *anda* and *para*, like Greek *para*, mean "with," "because of"; *gan=gōn* or *goon*, is Greek *goon*, accusative of *goos* "grief," "lamentation"; and *paauar*, *im-pauwaar* (compare Greek *tromos*, *en-tromos* "trembling") are cognate with Latin *pavor* "tremble," "be agitated."

The usual negative employed in these Hittite texts is the Assyrian *uul* "not," rather than the Greek *ou*, which would be spelled *uu* in cuneiform. It is probable that the use of the Assyrian word was graphic only, much as the Anglo-Saxons usually used 7 and we sometimes use &, and in arithmetic +, all three corruptions of the Latin word *et* "and." But twice we find *naata* (pp. 9, 36)=*māta* "not," Greek *māte*, *mēte*, "not."

It must be understood that the exact form and meaning of a goodly number of Sumerian and Assyrian words in these texts are unknown, or, at least, were not made out by Professor Delitzsch. For example, in the first line dealt with (and similarly in the second) Delitzsch reads Assyrian *saninam laa isuu*. From this he assumes that an initial *sa* "who" has been omitted by mistake, and translates "[who] has not a rival." But the text is all right as it stands, reading *sa ninam laa isuu* "who has not everything," which corresponds exactly to the Sumerian *gi nu tug* (*ki nu tuku*) "has not everything," *ninam* being obviously the same as *minma* "anything," "everything," "all." The corresponding Hittite text is defective. In the fourth and sixth lines Delitzsch mistook Assyrian *urtam* for the similar *irtam* and "with extreme reserve" suggested the reading *sa teirtam irtam laa isuu* "who has not a held-back breast"; whereas the text really is *sa teirtam urtam laa isuu* "who has not command" (literally, "command issued"), which corresponds to the Sumerian *sukar nu tuku* "who has not authority," and to the Hittite *kuis arkuuwaar naata iiazi* "who does not issue commands." It will readily be seen that the effort to make the Hittite text read "who has not a held-back breast" would be hopeless, no matter what language it was supposed to be. In other words, before we can determine the meaning of the Hittite words from the corresponding Sumerian and Assyrian words, we must be absolutely certain what the Sumerian and Assyrian words mean. In fact, I do not hesitate to predict that in not a few cases the meaning of the Hittite word will be determined first, by the aid of the usual Greek form, and that the meaning of the Sumerian and Assyrian words will be determined by that of the Hittite. For example, in the light of what we have seen above, it is clear that *kuid maan* (p. 27, Z. 17) is *qid mān*, later Doric *ti mān*, Attic *ti mēn* "what then?" which thus gives us the meaning of the corresponding Assyrian *aru*, which may be a variant of *allu* "then." In a recent paper in the Journal of the Royal Asiatic Society, Sayce has succeeded in identifying some of the Sumerian and Assyrian words with more success than that which Delitzsch achieved.

II.

The discovery that the Hittites were Greeks will, of course, have far-reaching results. But what seems to me at present hardly less important is the fortunate accident that has put into our hands texts that furnish evidence as to the nature of the language, such as even the most timid conservative must recognize. For we are thus saved in the case of Hittite the delay and the various unpleasantnesses that are prone to mar the transition from the entertainment of erroneous traditional conceptions to the acceptance of unexpected truth.

The Public Schools

PROFESSOR DEWEY'S ADVOCACY OF A BROAD VOCATIONISM—MR. WIRT'S SCHOOLS AT GARY, INDIANA.

The universities having passed through a period of searching criticism, both from without and from within, and having now, with one notable exception, relapsed into some show of equanimity, the same ordeal of popular attention has become the lot of the public schools. Do these schools prepare boys and girls as well as they might be expected to do for the wage-earning life which the large majority, without higher education, are destined to enter? Is not the average curriculum a futile relic of other days? Are we not attempting to drum into children's minds the crystallized knowledge of the adult? These are some of the sweeping questions which are being asked by leading educators. No satisfaction is apparently given by the thought that the situation cannot be hopeless, since numerous products of the abused system have survived it to become men and women of brilliant attainments. The impression is abroad that something is radically wrong with our educational methods, and the sooner we find out what it is, the better for us and our children.

One of the severest critics of the current system, Prof. John Dewey, has presented, in his new book, "Schools of To-morrow,"* a considered plea for a change to some system which shall be better adjusted to the requirements of everyday life. He feels, perhaps rightly, that a serious wrong is done to the large percentage of pupils who quit school at the age of fourteen and enter industrial positions for which many of them are not fitted, and the bearings of which on life in general they cannot understand in the least. In some fashion a cultural education should be formulated, not out of the usual book learning, but from the materials of the nation's practical existence. It is not technical schools which Professor Dewey has in mind, nor the sort of vocational training which in effect merely adds technical instruction to the curriculum now in use. He would revolutionize education from the first grade on, with the aim of making clear to students the relations of subjects taught to the possibilities that will confront them in after life. The "primary and fundamental problem is not to prepare individuals to work at particular callings, but to be vitally and sincerely interested in the calling upon which they must enter if they are not to be social parasites, and to be informed as to the social and scientific bearings of that calling."

With this desire to steer a middle course between the extremes of bookishness and of the "practical" education, few persons will quarrel. The difficulty is to invent a system which, while drawing its subject matter from the student's environment, shall not descend to the dead level of materialism. With all its sins upon its head, the current system of education retains some of the spiritual dignity which has traditionally been associated with learning, and there would be an irreparable loss if this should vanish. Professor Dewey, however, is satisfied that the principles he has at heart can already be seen in successful operation in three or four institutions about the country; and the purpose of his book is not only to describe the workings of such schools, but to convince the public that they have a philosophical justification.

The most interesting of recent experiments along the lines which Professor Dewey approves is the organization which Mr. Wirt has built up in the past ten years at Gary, Indiana. Much has been written of late about the Gary schools, and such a following have they won that Mr. Wirt has been asked to experiment with conditions in certain other cities, notably with two of the most congested schools in the Bronx district of New York. We do not say that Mr. Wirt is not deserving of all the attention which he has attracted, but it is most fortunate that his ideas should just at this time be examined by a person of Professor Dewey's competence and be assigned to their proper place in the large scheme of education.

Briefly, the Gary schools were founded to meet the special needs of an industrial town having a somewhat drifting population. The opportunity, as seen by Mr. Wirt, was twofold: to prepare the children of factory workers for useful citizenship, and, largely through the agency of the pupils, to better the conditions of the factory workers themselves. This, obviously, could not be done unless the schools were seen to have practical value and became the accepted centre of intellectual life. With these objects in view Mr. Wirt decided to throw overboard the bulk of the traditional system and to start afresh. One of his most important features is keeping the school buildings open in the evening and on Sundays and holidays, so that there may be public lectures and night classes for parents. He soon found that adults were relying upon the school to answer all manner of questions and were investing it with a community spirit. Instead of being confined mainly to book learning, the pupils, through the training they receive in shops, laboratories, etc., are educated to keep the entire plant running. In the machine and carpenter shops they make the desks, for instance, required in the classrooms. They are encouraged to put into practice the lessons dealing with the nutritive values of foods by selecting the menus and cooking the dishes for the school luncheon. Pupils attend to the bookkeeping and ordering of the school store. They apply their mathematics, among other things, in laying out and equipping playgrounds. They make plans of their parents' houses, and these are studied by all so as to learn the difference between good and bad arrangement, and perhaps dissuade their parents from renting houses which are undesirable.

Without attempting any full description of the Gary schools, we may note also that, though the pupils are graded, those of all grades—or roughly of ages from four to nineteen—are to be found in one building, Mr. Wirt's idea being that if young pupils are constantly thrown with older pupils and on occasions serve as their helpers, especially in the shops and laboratories, there will gradually be implanted a real perspective of education. It must not be inferred that students are not drilled with textbooks, and in such subjects as history and Latin, only lessons without application count for less than faith without works. By numerous devices knowledge is vitalized for old and young alike. Little children are not kept poring over books, but are set tasks which allow their bodies free play, such as clay modelling and basket-weaving. Boys in the higher grades are allowed to spend much time in working out the intellectual and mechanical problems connected with the vocations which, so far as they are able to decide, are to be theirs after leaving school. That Mr. Wirt succeeds in making knowledge attractive is attested by the number of his pupils who continue their studies after reaching the legal age when they are free to retire, and by the considerable percentage of students who go from Gary to the State universities.

Mr. Wirt's labors at Gary, so far as we can judge, have borne rich fruit. He is giving to children, often of foreign-born parents, an American self-reliance and is helping them to become useful citizens. By a system so flexible that it responds easily to the peculiar needs of the individual, be he dullard or prodigy, he is apparently able to keep all the students actively interested. A system which does this in days when even our colleges are complaining of the blasé spirit of youth should not lightly be dismissed. Yet it is a question whether Mr. Wirt's methods, except for the revolutionary extent to which he has applied them, differ from the practice which has been attempted by the colleges themselves; namely, the introduction of courses, especially in the department of economics, which prepare visibly for positions in business. Or there are courses in sociology which are occupied almost entirely with a classification of the statistics gathered by students in their "field work." As is well known, the colleges have been widely criticised for this very emphasis put upon the practical, because of the further impression given that the so-called cultural courses have no real value. It has been felt by many that the endeavors of the colleges to bring themselves up to date have gone far enough, and that faculties would be wise if they took for granted the usefulness of the humanities and of pure theory.

The problem as applied to the public schools is, however, special. There the grave fact has to be faced that the education of an enormous number of children ends at the age of fourteen, and that they are compelled to

*Schools of To-morrow. By John Dewey and Evelyn Dewey. New York: E. P. Dutton & Co. $1.50 net.

meet the world with little more than the three R's at their command. For it is not to be supposed that at that tender age the wider significance of the usual book-learning can be firmly grasped. Yet, even so, should we by a sweeping change endanger the cultural training which our high schools are giving to hundreds of thousands of students? Professor Dewey would doubtless answer that this begs the question, since the Gary system, if universally applied, would bestow as much, if not more, culture. We are not so sure that it would. In the hands of so vigorous a personality as Mr. Wirt it may show almost limitless possibilities. It is true that Christ taught spiritual values by reference to such commonplace objects as money changers and fishermen and granaries. But a system which places the emphasis consistently on application to everyday life can scarcely fail, if untouched by an imaginative teacher, to deal almost exclusively in the material.

Now, whatever else the schools of the country may have done, they have shown a wholesome respect for theory, and by requiring pupils to be occupied some of the time with subjects remote from practical interests have given an inkling of that background of life without which existence would be dull and flat. Of the two extremes, it is perhaps best that pupils should understand little of what they are taught than that they should fully understand all. Mr. Wirt circulates printed reasons for studying Latin. Some of the reasons for learning this language can be made intelligible to young folk; others can not. Is it well to create the impression that every subject, in order to justify itself, must have a *raison d'être* visible to the naked eye? All education should be practical in the sense that it should fit into a useful scheme of the universe; but the use of some portions of it need not necessarily be felt by students until long after they have left school.

This seems to us to be the one considerable flaw in Mr. Wirt's system. He has improved enormously on the trade school by equipping students not for one given occupation but for any one of many, and he has no doubt demonstrated the need of making great changes in the curricula of the public schools. But before casting off the whole apparatus of a scheme which has grown as an organism through the ages, we shall do well to make sure that any substitute does not neglect the advantages of pure speculation. Over this aspect of the question Professor Dewey, who carries the principles underlying the Gary system back to the educational theories of Rousseau, seems not to be greatly concerned. And it must be confessed that the picture which he draws of the workings of the Gary schools is most alluring. One might fancy that the attention there given to correlating the various branches of knowledge would in itself furnish a broad outlook. We wonder, however, whether the pupils at Gary catch the vision of it with anything like the clarity with which it strikes Professor Dewey.

Communications on Educational Topics

PERIODICALS IN COLLEGE ENGLISH COURSES.

To the Editor of The Nation:

Sir: An interesting development of the past four or five years in the college teaching of English has been the increasing use of periodicals as supplementary reading. The *Atlantic Monthly*, I believe, was the first to enter the field. Some enterprising instructor conceived the idea of having a class subscribe for the *Atlantic;* the idea was, of course, encouraged and well advertised by the publishers; and there is now a long list of colleges, normal schools, etc., in which the *Atlantic* is regularly used. A club rate is offered to classes for three or six months' subscriptions. Several other periodicals, including some of the best weeklies, like the *Nation*, now offer similar rates to college and other classes.

My own experience has been confined to the use of the *Atlantic* for one semester in a sophomore course in exposition. The results, though not conclusive, were in some respects disappointing. I hope that other teachers who have tried the plan may feel like discussing it in your columns.

Some of the advantages of the plan are obvious. A surprisingly small percentage of college students read regularly any good journal; and any device which will lead more of them to form the habit of reading a serious weekly or monthly is worthy of consideration. The benefits may vary somewhat according to the periodical chosen; but all the publications now being used in this way have genuine value. A suspicion may be roused in the skeptical mind, however, by the general tone of the letters from teachers quoted in the publishers' circulars. The point which most of them emphasize is the increased interest in class-room work. Many of them run something like this: "Since we substituted the —— for our reading list of classics, the interest of class discussions has more than doubled. The students have come to see that the principles they have been studying are something more than abstruse rules followed by great writers in the past; that they have a vital and practical application to the discussion of present-day problems," etc. It would appear almost as if some of the teachers had discovered for the first time that the principles of composition are something more than fossil remains. If so, here is, of course, another argument for the plan. But it seems needless to remark that a good teacher ought not to require the help of a magazine in making the vitality of his subject realized. One is led to suspect that a principal reason for the wide adoption of the plan is that it makes the immediate task of the teacher vastly easier. But is class-room interest, by itself, an adequate test of teaching? Has the teacher done enough if he has kept his class interested, at the same time trying to cultivate in them a taste for good journalism? Of course, it is easier to interest students momentarily in current journalistic writing than in Burke or Swift or Arnold; the real question is whether the teacher who throws over his "reading list of classics" for even the best of journalism is not sacrificing permanent to temporary values.

Is the interested student really acquiring and carrying away from his periodical reading anything like the equivalent of what he would get from a well selected list of classics? My experience suggests that he is not. I tried the experiment with the periodical which seemed best fitted for the work in hand. Although the class showed a lively interest in the essays while they were being discussed, the ideas and impressions remaining in their minds at the end of the term proved painfully slight and vague. The fact is, of course, that no periodical can present a series of articles comparable in substance or form with a well chosen list of great essays. The accidental interest of timeliness by no means compensates for the lack of more solid qualities. The habit of reading the magazine, however, if it is continued by a considerable number of the class, might turn the scale in favor of the new plan. One point on which I should be glad of information is this: about what per cent. of an average class form the habit of reading the journal used? Teachers who have followed the plan for three or four years may be able to throw some light on this question. If we are to judge between reading a periodical merely for three or six months and reading a corresponding amount of standard literature, the verdict, I think, must be against the periodical. Colorado Springs, September 5.

A NEGLECTED ASPECT OF GRADUATE INSTRUCTION.

To the Editor of The Nation:

Sir:

. . . we have never expected the graduate schools to train for a career in literature; they have a distinctly different aim: to turn out teachers. The man who goes to a graduate school in order to become an author is patronizing the wrong shop.—[The Nation, May 14, 1908.

Such was the reply of the *Nation* to a correspondent's protest against what he considered the throttling by graduate schools of all creative literary work, and while some of those who obtain higher degrees may devote themselves exclusively, or as a side issue of academic life, to literature, research, and expert work of various sorts, the statement above will, I think, be accepted without question. It was not challenged in the discussion to which the letter and editorial gave rise, and surprisingly, no one pointed out that the methods used are neither in theory nor in fact adapted to fulfil the aim of training teachers—an inconsistency that is seldom remarked, and rarely, if ever, stressed.

Graduate instruction in the United States, either implicitly or avowedly, is so conducted that the students receive a certain amount of information and are shown where to find a greater amount, the object being to approximate a complete disclosure of the sources of knowledge in a particular subject. Even the undergraduate system of lectures, in part at least, accomplishes this, but the graduate differs from the undergraduate work in that the students are expected to do more than absorb facts; they are shown the scientific methods of able professors in attacking and expounding particular problems. If the preparation of teachers is the aim of the instruction, the graduate student should be equipped not only to pass

on the information which he has acquired from the lectures and collateral work, but to present it in such a way that his undergraduate students will easily comprehend and become eager to learn more. In this sense, graduate and undergraduate instruction differ in degree as well as in kind, but the advanced lectures, properly appreciated, are calculated to enable the student to acquire the information and, in some measure, the knowledge of methods necessary for collegiate work.

But the other, perhaps the more important and certainly the more distinctive, feature of graduate instruction is the training in research. The "indispensable adjunct to true university work" is the seminar, and its *raison d'être* is "to teach the student how to handle his material and by interpretation or discovery to make a contribution to the store of existing knowledge." Nowhere, however, in the symposium by graduate professors on the true function of the economic seminar, from which the quotations are taken, is there any mention of the fact that the vast majority of those trained in the seminar will be expected to conduct undergraduate classes. The training is wholly in research, in scientific methods, in scholarly habits of thought —all, it is true, highly important for a successful teacher, yet all primarily designed to induce future productivity. A few of those who begin an academic career may be permitted, from the first, to present the results of original investigation; yet the majority, either for life or as a preliminary to something else, must give instruction to college students, and nowhere in the scheme of graduate work that I have roughly outlined is this fact avowedly considered.

It is perhaps permissible to point out that only graduate schools have neglected the aspect of instruction that I have been considering. In medicine, for example, the student acquires knowledge; what is more important, however, is to put this knowledge into practice, and he learns how, not by doing research, but in making people well. His training in dispensary and hospital, under competent guidance, is a most important part of his course. At the law schools of the country, much attention is devoted to moot courts where the future lawyers meet and fight out disputed issues just as in the trial of a real cause. The same is true of theological instruction, and perhaps this analogy is closest, for both the clergyman and the teacher give the public not what it demands, but what is good for it. At the theological schools a man is prepared, among other things, to preach, and before he graduates he is taught the principles of preaching and receives the opportunity of putting them into practice. Even in the schools of journalism —a recent development of professional education—the students write "stories," "build" head-lines, and practice actual newspaper work. But in graduate instruction, although the object is to train teachers, there is no effort made to do this; the student receives his degree as evidence of his fitness to teach, and neither the professor nor the student himself knows whether he can do it.

Such is the problem by which, as a graduate student, I have been puzzled. A remedy I do not propose, and, above all, am not so rash as to imply that there should be any required study of the pedagogics of undergraduate work, as is the case in Europe. My point is simply that some time should be devoted to training the student in oral and extemporaneous discussion of elementary problems, and that, before turning him out into academic life, the professor should discover whether the student is able to teach. In the discussion of the economic seminar to which I have already referred, Professor Taussig stressed the fact that at Harvard the *reading* of papers is frowned upon; the students are desired to *talk*, but about original work that they have done. This is a tendency in the right direction, but certain it is, I think, that the seminars, discussion clubs, reading classes, however conducted, make little, if any, conscious effort towards giving a student instruction and practice similar to that which, in the strictly professional schools, is considered well-nigh indispensable both for rounding out his training, and enabling him to see, ofttimes, that a mistake has been made in his choice of a vocation.

COLLEGE COMPOSITION.

TO THE EDITOR OF THE NATION:

SIR: Still the crop of books on composition is ripening: you can almost hear them patter; you can almost see them fall. To-day it is Business English and Correspondence; yesterday it was Prose Narratives and Essays in Exposition; these latter followed Essays in Modern Thought and Essays for College Men; and these, in turn, were preceded by Theory and Practice of Technical Writing, and always the host of rhetorics, each emphasizing a cherished discipline. In the old days it was the intensive study of special authors, with composition on the side, and in the days before that, treatises on rhetoric as a branch of philosophical inquiry. Rhetoric to the Greeks was again quite another matter. And so the thing goes round and round, not, to be sure, in a perfect circle; there are wheelings within wheelings, epicycles, conic sections (to indulge the figure), and hyperbolas. Perhaps this whirl is not so wanton as, at first glance, it appears. It may somehow spin itself into order. Anyway, aggressive differences are supposed to be more excellent than a satisfied hush.

But just where we are now, whither we are tending, what the study of composition will be twenty years hence, only a very bold man will venture to prophesy. One condition, however, is apparently stable, as stable as a multitude of facts and constant iteration can make it so—the average youth of to-day in this country murders his native or adopted tongue. And that is why "English" has been made compulsory in our colleges; why, also, as the condition does not seem to improve, new schemes (never new) and fresh methods (never fresh) are being constantly flipped into the caldron.

Composition in the lower schools is also suffering at this moment from hectic theory and experiment. A rather frail wagon is hitched to its star. The over-emphasis on oral composition threatens to magnify the pupil's readiness at the expense of his exactness, and the plethora of "dramatization" may divert the few at the expense of disciplining the many. The facts proclaim that high-school pupils need more of a call to drill and less of incitements to glory. The special pleaders, however, who appear to occupy the high places, are turning out pupils with a strangely distorted conception of what the nature of composition really is, how stern and humdrum and modestly useful, as useful, in fact, as grammar. When composition again comes to its own in the high school, perhaps the college will find that it can sit a while and ponder. The conclusions of this questioning, to be sure, will be devious; there are intimations, however, that a good many teachers are calling for a separation of composition as taught in the high school from composition as taught in college. They reason somewhat in this wise.

Why have the departments of English in our colleges been carrying the entire burden of composition? Has, indeed, composition a more intimate relation with imaginative literature than it has with any other kind of literature, the sort that historians write, for instance, or scientists or philosophers? To be sure, it has not, and to establish the fact the unnumbered compilations of "models" are replete not only with their descriptions and narratives (belles-lettres), not only with their criticisms, their discussions of the curriculum, their unending disputes between science and literature, but as well with their legal and political documents, and finally with the most profound matter—whether we ought to believe or ought not to believe, and if we believe, how much belief will leave the soul pure. The department of English is straining to become a forum of discussion of all questions that have assailed human intelligence.

Now, the motives underlying this appropriation on the part of the teachers of English are surely unexceptionable. Why should not students be put in touch with the whole range of thought? Yet what a load it puts upon one department! These instructors of English are asked to become actively conversant with science, politics, philosophy. Though still devotees of belles-lettres, they are also striving to speak with authority on every other subject. The wisdom of the age is theirs. Frankly, the assumption is rather startling. May not a cog have slipped somewhere?

Would it not be possible, we wonder, to inveigle other departments—history, economics, philosophy—to take upon themselves a part of this burden? The department of English could furnish them with sterling models; it could point to the choicest titbits of a century. How to handle argument it knows from the enunciation of the question to the final clinching sentence on any side of any subject. An able-bodied instructor in economics, say, could cover the whole field of argumentation in a week of evenings. Perhaps he could even simplify the scheme a trifle.

If departments other than that of English would be willing to shoulder a part of this burden of composition, there might be some wholesome readjustments all along the line. A teacher of the subject in the lower schools might still be attached to the department of English. The pupils there are less apt to be called upon to sweep the horizon. But in college this assumption of a knowledge of the universe is in danger of inducing mental breakdown. Sometimes it would seem as if the new departments of journalism were unique in knowing what they are driving at. And when it is certain that they bid for quality as well as for numbers, and content themselves with a special field, it looks as if they could care for their own. But those students who are not attracted to journalism

are turned into the department of English, whose apparent function is the study of imaginative literature, but whose present vocation on the side of composition is a vague encroachment into fields for which their training is palpably not of collegiate standing. If colleges would only insist that those who come to them shall submit stuff that no longer needs to be proof-read, there is no obvious reason why all departments—economics, history, science, philosophy, belles-lettres—should not attend to their students' expression. Advanced courses in rhetoric for those who desire a special training could well be manned by the department of English.

Such a scheme as I have suggested demands, to be sure, much further discussion. I simply offer the foregoing as a sort of footnote to much that has already been written on this disquieting topic.

EDWARD A. THURBER.

Colorado Springs, July 10.

A SUGGESTION FOR HUMANIZING ELEMENTARY LATIN.

TO THE EDITOR OF THE NATION:

SIR: No doubt the war has given considerable impetus to the study of Cæsar in the schools. Perhaps it is therefore an inopportune time to call attention to the disadvantages of the "Gallic War" as the first piece of Latin literature studied by most pupils. It may seem an impertinence, too, for one who is not a Latin scholar, but only a lover of Latin, to express an opinion in regard to Latin teaching. Yet I should like to advance for what it is worth a suggestion which I have had in mind for some time, in the hope that it may be discussed by those who are better fitted to judge of its value than I am.

It originated in my brief experience in teaching high-school Latin a number of years ago. In the earlier years the chief difficulty, I believe, is in getting pupils to realize that Latin is a language which people actually talked and thought and lived in. When a student has once grasped this fact, he can scarcely fail to be interested. Now, from this point of view, I think it would be rather hard to select more inappropriate books for the beginner than the "Commentaries," Cicero's Orations, and the "Æneid." It is as if, in French or German schools, the beginner in English should be required to read first Gibbon and then Burke, with "Paradise Lost" as the next course, and as if the primer were to be based on Gibbon! Is not the analogy a fair one? And could any student imagine, or any teacher be expected to convince him, that English was anything more than an elaborate instrument of great writers? Would the foreign student dream that people made love, and swore, and gossiped, and quarrelled in that stately and formal medium with which he was so imperfectly acquainted?

My suggestion is briefly this: that instead of driving the beginner through an elaborate military history, with its intricate grammatical constructions and its artificial word order, utterly different from anything he has known, we should lead him to literary Latin through colloquial Latin, using Latin comedy as a basis. I know that in recent years encouraging experiments in this direction have been made; but so far as I am aware, they have not included my capital point—the substitution of Plautus for Cæsar as a basis for elementary texts. Let some scholars select two or three of the plays of Plautus; perhaps the "Menaechmi" and the "Miles Gloriosus" might be used. Let these be expurgated so far as is expedient, and edited for the beginner, and let a first Latin book based on these be prepared. I must not trespass on your space by arguing at length the advantages of such a plan, but perhaps I may mention some of them:

(1.) The average student would find Latin far more interesting, because he could scarcely fail to recognize early that it is a language in which people lived.

(2.) He could begin earlier really to read Latin, and would find it far easier, because two of the great difficulties, elaborate construction and artificial word order, would be in considerable degree postponed till he was ready to grapple with them. There is difficulty enough for the beginner in acquiring a new vocabulary and a new grammar; the difficulties of formal literary style and artificial word order would be much less formidable if they could be postponed till the student had in some measure mastered the others.

(3.) The general vocabulary which the beginner would acquire in reading Plautus would be on the whole more serviceable to him in his later reading than the specialized military vocabulary of Cæsar.

(4.) A knowledge of Plautus would be more valuable to him in his study of modern literature than a knowledge of Cæsar. I need not point out how essential to the understanding of either French or English comedy is some knowledge of Plautus. On the other hand, Cæsar's influence upon modern literature is almost negligible.

After the student's reading of Plautus, I would have him read parts of the "Metamorphoses" and of Petronius; then something of Cicero—perhaps a couple of orations, the "Somnium Scipionis," and some selected letters; then something of Livy or Sallust, and of Virgil. The details of the programme do not especially matter; it might be varied in numerous ways. But would not such a list of books present Latin literature as a far more human thing than what the schoolboy sees at present? And would it not be practicable?

If this plan really has the advantages which I have mentioned, it should enable the student to make considerably more rapid progress than he now makes. It might enable him to meet the entrance requirements of the more liberal colleges even as they stand. At all events, I should like to see the plan discussed.

J. P.

Chicago, August 26.

RELIGION AND AMERICAN UNIVERSITIES.

TO THE EDITOR OF THE NATION:

SIR: It is a current misconception that our undenominational State universities are irreligious, whereas from personal experience with at least four of the leading institutions in America I am led to believe that State and undenominational institutions are actually more religious than so-called out-and-out denominational institutions. Perhaps the reason is self-evident. The denominational institution must be on its guard against the attack of overdoing religion or rest on the assurance that the denominational name makes it sufficiently religious; while the undenominational institution must ward off the charge of irreligion by emphasizing the religious and moral life. For example, take the University of Illinois, which had a great task, especially about a dozen years ago, in convincing the people of the State that the institution was not irreligious. To-day it would be difficult to find a university in the country that is pervaded, both faculty and students, by a deeper religious atmosphere, where the faculty are so little given to boasting skepticism and making light of orthodoxy and tradition. And yet the University of Illinois holds neither a daily nor weekly chapel service, all such functions being performed by the Y. M. C. A. or denominational student churches. The moral atmosphere is unusually high and the community has been dry for several years, a State statute forbidding a saloon within four miles of the University. Smoking is prohibited on the campus and about the buildings, although the reason is protection against fire, since the State of Illinois does not permit the University to insure its buildings.

But though, as at the University of Illinois, some of our denominations have student churches for the purpose of "holding together" the students of their denominations, anything like a concerted, well-organized, and well-standardized work in religious education is lacking. For some reason, the denominations have not felt this decidedly strong obligation to create a thoroughly standardized coöperative school of religion as an adjunct of the undenominational university, where courses in religion can be put on an equal basis with all of the courses of study of a university curriculum.

Here is the problem, more concretely. At a meeting of the representatives of one of the largest denominations in the United States, it was discovered that the denomination had more of its students at the University of Illinois than in all of its denominational colleges in the State combined. According to a recent report of the Registrar of the University, of a total of 3,253 voluntary answers, there were 907 Methodists, 617 Presbyterians, 264 Congregationalists, 239 Disciples, 228 Baptists, 214 Catholics, 195 Episcopalians—with forty-one shades of belief, including one agnostic, one Confucianist, and several Hindus. While money is being spent, therefore, on a couple of hundred students in a denominational institution, why should the obligation to twice as many thousand at a great university be neglected? Theological schools of a bare hundred students have an endowment of a million dollars, but where is the Christian financier who wishes to invest his thousands of dollars at one of these undenominational centres of learning where every year there are thousands as against the hundreds who in a score of years will be the church-leaders as well as community-leaders wherever they chance to be situated?

It may be argued that we have not yet attained a sufficiently high standard of civilization to coöperate in religious education. Then, where is the Moses of religious education to lead the denominations out of the wilderness by doing for them what Andrew Carnegie has done for libraries and the Rockefeller Foundation for the small college—namely, to create a school of religion at an undenominational university?

VERGIL V. PHELPS.

Urbana, Ill., June 11.

REVIEWS

AN EXAMINATION OF THE TEXTBOOKS PUBLISHED SINCE LAST SPRING AND OF CERTAIN OTHER WORKS BEARING ON EDUCATION.

EDUCATIONAL THEORY.

"Education for Industrial Workers" (World Book Co.; 90 cents), by Dr. Herman Schneider, who organized the coöperative courses in connection with the University of Cincinnati, is by intention Dr. Schneider's share of the Hanus report upon the New York city schools; in fact, it amounts to a brief and rather interesting exposition of the author's ideas about industrial education. Of particular interest is the distinction between the energizing and the enervating trades—such as those which involve the automatic process of feeding a machine. Dr. Schneider points out that industrial education has hitherto favored the energizing trades, in which also the nature of the work renders the mental conditions more favorable. Yet the larger and more pressing problem relates to the enervating trades; and for this the author offers no clear solution.

Probably few of our readers are interested in rural schools. Yet a book of well-considered practical suggestions for the elementary teacher, written in clear and dignified English, with no pretension to educational philosophy and an entire freedom from cant, by a supervisor of training in a State normal school—such a volume is surely worthy of note; and such is the little book entitled "Everyday Pedagogy: With Special Application to the Rural School," by Lillian I. Lincoln (Ginn; $1).

A different and more typical product of the normal school is E. L. Kemp's "Methods for Elementary and Secondary Schools" (Lippincott; $1.25). Gov. Brumbaugh's Introduction assures us that, in contrast to all other works upon method, this is the vital and real thing. Mr. Kemp adds to the obvious a certain warmth of eloquence; otherwise his book does not differ from others of its class.

"Learning by Doing" (Bobbs-Merrill), by Edgar James Swift, of Washington University, is a fine example of pedagogy with a punch. The latest volume upon Youth and Doing is marked, like the others, by that peculiar effervescence of style which is characteristic of the *Saturday Evening Post*, from which some of the material is drawn. We have no doubt that "Learning by Doing" will be a pedagogical best seller.

That "Handwork as an Educational Medium" (Macmillan; $1), by Philip Boswood Ballard, should call for a second edition seems to indicate that English school teachers are not yet as completely saturated with pedagogical literature as those of the United States. The arrangement of the book suggests a somewhat haphazard collection of essays following in the main the ideas of Professor Dewey. Yet most of the chapters are good reading; it is clear that Mr. Ballard writes from independent personal conviction. And the chapter on Ambidexterity, if somewhat parenthetical, is curiously interesting; in this chapter we learn of an Ambidextral Culture Society, whose views Dr. Ballard condemns.

"History of Education," by Patrick J. McCormick (Catholic Education Press, Washington, D. C.), is scholarly in tone, and makes the subject interesting. Though written especially for Catholic teachers, we think that the Protestant reader would find few grounds for complaint. The book differs from other textbooks of the history of education mainly in the emphasis laid upon mediæval education and mediæval universities, which, according to Prof. McCormick, not only preserved the literature of antiquity, but laid the basis of the education of a considerable portion of modern society. "What has survived to-day in university or higher education, and largely in secondary, is the direct bequest of the scholastic teachers."

Under the title of "Readings in Vocational Guidance" (Ginn; $2.25), Meyer Bloomfield, of the Boston Vocation Bureau, has collected some forty-odd addresses, articles, and reports, mostly by writers well known in the field of education, which form as a whole a kind of small encyclopædia of vocational guidance. Some of the articles are theoretical, but the greater number are concerned with special aspects of fact, such as the conditions and opportunities in various occupations and in various places, and the natural vocational choices of children in the schools. The contributions are naturally of unequal merit and importance, but the book is the first extended presentation of the ideas and facts underlying a new movement, and it should be a useful volume to those who wish to study the possibilities of vocational guidance.

The dean of women is a new figure in educational circles. She has arisen in the last quarter-century as a result of the growth of co-educational colleges. Beginning with the anomalous office of preceptress or adviser of women, she has gained in dignity until, in the State universities of the West, she enjoys the title and authority of a dean. This development is recited in a somewhat querulous voice by Lois Kimball Mathews in "The Dean of Women" (Houghton Mifflin; $1.50). The problems and duties of that dignitary are yet ill-defined and far from uniformly interpreted. In fact, Dean Mathews is the first to essay a discussion of her position and opportunities. For this important task she is excellently equipped. She not only has the experience necessary, she not only takes a broad view of the educational situation, but her understanding of young women is intimate, and her vision is not dimmed by prepossessions in favor of her sex. She casts no halo of glory about the undergraduate girl. She perceives clearly the difficulties that confront her and her besetting weaknesses. Such practical matters as living conditions and means of employment she discusses with the same clarity and ease that are found in chapters on Self-Government Associations and Problems of Student Discipline. Vocational guidance is not brought out of the nebulous state in which it now floats in most minds, but the social life of the students, with their eagerness for extra-curricular activities, as well as their intellectual life and "docile minds," are described from sage experience. For the office of dean of women the writer has a jealous regard. The incumbent should be a scholar who will win respect from the most austere of her male associates. She should be a teacher of exceptional ability to expound and inspire. She should discharge her administrative duties with ease and dispatch, never making a mistake of judgment and always stoutly abiding by her decisions. She should not only be able to dress with taste and distinction, and to entertain university presidents and awkward freshmen with equal grace and charm, but she should likewise have run in her own life a wide gamut of joy and sorrow, in order that she may help sympathetically all the various types of girls in her charge. In short, all requisites are mentioned except a pair of wings. As a counsel of perfection the volume should aid all who are beset with the perplexities surrounding the administration of the women's part of a university.

A wholly admirable handbook and guide for parents and others interested in private schools is Sargent's "The Best Private Schools" (Boston: Porter E. Sargent). It is an attractive volume of convenient size, announced as the first of a series of annual handbooks relating to education and travel. Various divisions of the book consider boys' schools, girls' schools, co-educational schools, special schools (including those devoted to music, art, kindergarten training, physical education, dramatic training, household arts), the private schools of Canada; directories of associations, periodicals, teachers' agencies, outfitters and dealers in school supplies. All this information is compactly and agreeably given. There is a brief history of each school, and a description of its character and peculiar advantages. In reading these accounts one feels that the writer is fair in his judgments, and that he is quite able to tell a good school from a bad one—even if the latter is brought to his attention by a glowing prospectus. One is reminded often of Baedeker. (Here it might be stated that school authorities are requested to send Mr. Sargent their catalogues and announcements.) We believe that many fathers and mothers will find this handbook most useful.

In "The College Course and the Preparation for Life" (Houghton Mifflin; $1.25), President A. P. Fitch, of the Andover Theological Seminary, discusses the serious problem of the instruction of undergraduates in our colleges. The "talks," given at Williams College, are manly and racy. Dr. Fitch speaks as an older comrade who knows the intellectual and spiritual difficulties of the undergraduate, and appeals to his common sense and to his higher ideals. Defining religion, not as dogma or custom, but as a force and a life, he urges on the young student the fact that the object of the college course is to make of him a thoughtful and conscientious man. He insists on a broad scheme of study, one fitted to give a full and well-rounded development, dwelling particularly on the value of scholarship and the cultivation of a taste for the beautiful. Collegiate illiteracy he pictures with friendly ridicule and biting sarcasm. Read widely, he says, going perhaps a trifle too far in liberality when he advises that "Tom Jones" should lie on the student's study desk as it lay upon Lowell's; "Tom Jones" is not food for babes, and Lowell and the undergraduate are two different persons. Dr. Fitch's volume is a vigorous and persuasive presentation of what the undergraduate may and should do, and it deserves to find a place in every student's library.

ENGLISH.

LINGUISTICS.

The revision of Emerson's "Middle English Reader" (Macmillan; $2 net), the most useful book in its field, shows some improvements over the first edition, for a year or more out of print. The glossary, the least satisfactory part of the original volume, has been entirely recomposed and purged of a handful of "howlers" that disfigured it. The list of irregular verbs has been omitted, but in compensation inflectional forms appear more numerously in the glossary. A few corrections have been made in the notes. Bishop Poor now appears correctly, but somewhat paradoxically, as "Rich. Poor" (p. 305). In some cases, as in Trevisa's translation of the "Polychronicon," the text has been reset. Additional matter may be found here and there in the valuable grammatical introduction. A point or two escaped correction; in §94 "O. E. palatal stop c" should read "guttural stop," and "W. S. *hleihan*," in §103, 2, has an odd look.

RHETORIC AND COMPOSITION.

The book of the hour for the college student is the volume of essays, usually pretty solemn, designed to start in the freshman a flow of ideas on such subjects as evolution, democracy, theology, and the like. Two rather refreshing variations of this type are "Modern Essays," selected by Prof. J. M. Berdan, and J. R. Schultz and H. E. Joyce, instructors in Yale College (Macmillan; $1.25 net), and "College and the Future," edited by Prof. Richard Rice, jr. (Scribner). In the first the selections are almost without exception of the twentieth century, or not long before; Whistler, Chesterton, and Stephen Leacock are only some of the essayists who give an airy lightness to the collection. It is pleasant and interesting throughout. There should be no great difficulty in getting college students to read it, at any rate; particularly Yale men, for the home product is amply represented.

Professor Rice's selections are serious, but they deal for the most part with questions as they concern campus life—Oxford, athletics, religion, studies. Indeed, the "college," in the hands of Newman, William James, and many others, including the compiler himself, is rather more adequately treated than the "future," which might, perhaps, in a book of this kind have been left to take care of itself, instead of to H. G. Wells.

Prof. John Louis Haney has arranged alphabetically under the title "Good English" (Philadelphia: Egerton Press) a number of notes on linguistic usage, many of which were contributed to the *Ladies' Home Journal*. Some very obvious errors and some extremely recent locutions receive comment, but the book is not a mere list of "don'ts"; it is tolerant in its judgments and sensible in its explanations. No one will grudge the author his occasional little dogmatisms. When he assures us that "*where* should not be used for *in which*, as, 'This is the house *where* I lived for ten years'" (p. 225), we are fain to remember "the house where I was born."

A similar and briefer list forms a useful appendix to Genung and Hanson's "Outlines of Composition and Rhetoric" (Ginn; $1). For the rest it follows traditional lines in the discussion of structure and type, inculcating its doctrine largely by means of horrible example to be corrected.

Picking up a new collection of short stories, one wonders what excuse the compiler can offer for his undertaking. In a field so thickly sown, why should a new head appear? But Mr. Leonard B. Moulton has proved in "Short Stories" (Houghton Mifflin; 40 cents net) that there is room for one more volume. He has no historical bee in his bonnet. The Egyptians and Boccaccio are left centuries behind. The great masters of the form are almost entirely neglected. The classics in this genre are uniformly omitted. Neither is he a worshipper of technique. Atmosphere and character and suspense are no more the goal for the student than they have been the guide for the editor. The result is an unusually fresh set of short fiction, gathered together because the life dealt with therein was thought to be of interest to boys and girls in high school, for whom the selection was made. The introduction, for the pupil, is little over four pages in length. The note following each story, omitting all biographical detail, indicates clearly by questions the content and significance of the specimen. There is comment on the craftsmanship or art of the narrator, but only such comment as should help to increase the pupil's pleasure in short fiction. In sympathetic hands the book ought to accomplish much in arousing an intelligent liking for this popular form of art.

Variety is the dominant note of the attractive volume, "Writing of To-day: Models of Journalistic Prose," made up of articles chosen by Profs. J. W. Cunliffe and Gerhard R. Lomer of the School of Journalism at Columbia University (Century; $1.50 net). This variety is exhibited in range of matter presented, which includes descriptive, narrative, editorial, and humorous articles, as also interviews and criticism, literary, dramatic, musical, and art; it is shown also in the length and character of the selections. Every group of them is prefaced by a concise analysis of the kind of writing represented in it, with practical hints for the novice. There is no denying the interest of the contents of the volume, with its accounts of "The Miracle of the Movie," "How I Found the South Pole," "Henry James's First Interview," "The War in Art," and so on for a hundred titles more, but the question is whether the pupil in English composition will find the ways to satisfactory writing better greased by these examples of "subjects of immediate interest" than by the traditional subjects "outside of his every-day interests." An outsider is tempted to fancy that a pupil would be as disheartened by having James Bryce's "Impressions of Palestine" held up as a model as he is supposed to be by the masterpieces of Addison and Macaulay.

SELECTED TEXTS.

As a supplement to the work in composition and rhetoric, a volume of "Readings from Literature" has been prepared by Reuben Post Halleck and Elizabeth G. Barbour (American Book Company). Prose and verse alternate, moderns jostle "classics," rising in a sort of climax from the ridiculousness of Bunner to the sublimity of Milton. It must be said the selections are interesting, and carry an air of completeness.

The Oxford University Press has just published Abraham Cowley's "Essays and Other Prose Writings" ($1.10), edited, with an introduction and notes, by Alfred B. Gough. It is the best inexpensive annotated edition. The volume contains all of Cowley's prose, except his preface to "Poetical Blossoms" and his letters. Each of the texts is based upon the first edition, including the very rare 1661 edition of "A Vision concerning Cromwell the Wicked." The introduction gives a trustworthy account of Cowley's life, a judicious estimate of his personality, and sufficient bibliographical guidance; but it says too little about Cowley's position in the history of English prose. Dr. Gough's comments on this important topic are, one regrets to find, scattered among the notes, where they are likely to be overlooked. The notes fill two-thirds as much space as the text; and leave no difficulty or allusion—grammatical, literary, biblical, or historical—unexplained. Some of them seem (to paraphrase Butler)

> Fit to take lodgings in a head
> That's to be let unfurnished.

It is doubtful whether any one likely to read Cowley requires a definition of such terms as "syllogism" or "mountebank." Yet the careful explanations of Cowley's allusions to ancient and modern political history unfortunately cannot, in the present state of undergraduate knowledge, be considered superfluous. Dr. Gough's critical interpretations are on the whole sound, but somewhat limited in range. For example, he does not point out the value of the "Preface to the Cutter of Coleman Street" as the first important defence of Restoration comedy against just the kind of attacks which it long endured but to which it finally succumbed. In commenting upon "A Vision Concerning Cromwell," he is so preoccupied with correcting errors arising from Cowley's partisanship that he fails to mention some of its most significant aspects. To open the eyes of modern readers to the full meaning of the "Vision" in its own time, he might well have remarked that Cowley's description of the temper and methods of a tyrant implies a confident hope, then widespread, that the Stuarts would reign in the spirit of constitutional liberty. Though Cowley exaggerated the faults of Cromwell, his philippic is of permanent value as a fervid warning against that forceful and unscrupulous type of personality which is nowadays termed the superman, and by which nations recurrently allow themselves to be fascinated and enslaved.

To the Riverside Literature series (Houghton Mifflin; 25 cents) has been added "Selections from American Poetry," by Dr. Frederick H. Law; shorter poems of Longfellow, Whittier, Poe, Lowell, Bryant, Emerson, Holmes, and Whitman, a half-dozen more or less to each, together with the necessary editorial matter.

GRAMMAR, ELOCUTION AND DEBATING.

A revised edition has appeared of Ella M. Boyce's "Enunciation and Articulation" (Ginn; 30 cents). Word lists and illustrated exercises make up the bulk of the volume. One would suppose that teachers might welcome phonetic descriptions somewhat more detailed than those provided. A list of words commonly mispronounced is appended. It is not always perfectly trustworthy. We hope, at least, that no one will accept its recommendation to pronounce "stomacher" with a "k."

"Teaching to Read," by Nellie E. Turner (American Book Company), does not concern itself directly with the work of the primary grades. It offers a methodology for teachers, and by means of elaborate question and answer dissects a great many very ingeniously selected passages, with a view to making clear such elocutionary matters as grouping, contrast, parenthesis, repetition. But teachers of reading anywhere will find it suggestive; it offers an effective club to drive "THE cat and THE dog" from our schools.

Another book composed for the teacher is Prof. Paul Klapper's "The Teaching of English" (Appleton; $1.25 net). In a series of chapters written in the tone of straightforward classroom lecturing, in which occasional split infinitives do not seem particularly shocking, the teacher is taught strategy useful in the long battle of the double negative; she learns how to provide the child with something to write about, how to stir his imagination by furnishing him with models above his level in tone; how to teach him to spell, and many other things. Much of this, no doubt, a good teacher knows already, but even such a one may well find the formulation of it useful.

Much of the matter in William Horton Foster's little book, "Debating for Boys" (Sturgis & Walton; $1 net), first appeared in a magazine for Boy Scouts. In its present form, it should interest new readers. It does not attempt an over-simplification of the serious business that genuine debating is, but the author has a knack of putting things concretely that enables him to discuss "terms" and "issues" and "clash of arguments" in a way to be comprehended of youthful minds. He writes of even the tests of evidence without darkening counsel. He lays stress upon fairness, presents by means of a narrative the proper procedure for organizing a society, gives a summary of parliamentary rules, and furnishes in appendices a long list of questions for debate, hints on how to judge a debate, and a model constitution for a boys' debating club. The chapter on The Ford Hall Town Meeting seems out of place in a book for boys.

MODERN LANGUAGES.

FRENCH.

Allen and Schoell's "French Life" (Holt) is a first-year reader comprising over fifty French sketches averaging a little more than a page in length, a few dialogues, sets of questions on the subject-matter, and answers from which the student is to work back to the questions, and a vocabulary. The sketches, which treat of a variety of practical matters, such as the house, garden, city, schoolroom, modern inventions, newspaper, weather, etc., have in general been skilfully composed, and considerable care has been taken in interrelating them as to subject-matter, vocabulary, and idioms.

"Le Premier Livre," an attractive beginners' book suitable for preparatory-school work, has been prepared by A. A. and B. Méras (American Book Co.; 64 cents). Designed both as reader and grammar for the first half-year, it consists of sixty lessons, the reading portions of which are adapted from Malot's "Sans Famille," while the grammatical parts contain the essential facts of grammar and paragraphs for drill in conversation and composition.

A prominent feature of Professor Olmsted's "Elementary French Grammar" (Holt) is an abundance of material for drill—grammatical questions to be answered in French, reading exercises, conversations, compositions, and oral exercises—appended to the lessons, of which there are forty-three. The grammatical material is grouped with good judgment, and careful choice of type aids the clearness of its presentation.

Racine's "Bérénice," edited with introduction and notes by R. E. Pellissier, is the latest addition to the Oxford French series (35 cents). This series is published by American scholars, under the general editorship of Professor Weeks. The introduction presents a clear account of the problem of the two Bérénices, prudently concluding that until new facts are brought to light it will not be solved.

"Les Boulinard," the amusing play by Orconneau, Valabrègue and Kéroul, edited, with introduction, notes, *questionnaire*, exercises, and vocabulary, by F. G. Harriman, is a recent addition to Heath's Modern Language series (30 cents).

Dumas's "Vingt Ans Après" has been ably edited for Ginn (60 cents net), with notes and vocabulary, by O. B. Super.

The *ballades* of yester-year are studied industriously by Helen L. Cohen in a recent Columbia dissertation ("The Ballade"; Columbia University Press; $1.75). The five chapters discuss the origin of the *ballade*, its fortune in France from 1400 to 1650, its treatment by French theorists of the same period, the Middle English *ballade*, and the recent revival of the form in France and England. Many *ballades* are printed in full, often from manuscripts or old editions; the volume has almost the look of a *ballade* anthology. The best chapter is that on the *ballade* in Middle English. Here the number of poems in question is so small as to permit individual study, and the resulting criticism is valuable. In the rest of the book very little—aside from the texts themselves—is really new. The later chapters, to be sure, offer slight chance for originality; but one might fairly expect, in a doctor's thesis, a fresh attempt to solve the difficult problem of the origin of the *ballade*, rather than a hesitant summary of conflicting opinions. The footnotes and bibliography are disfigured by the applying of the English system of capitalization to all foreign titles.

GERMAN.

M. H. Haertel's "German Reader for Beginners" (Ginn; 60 cents net) contains a singularly felicitous selection of fairy tales, those from Andersen and Grimm wisely modernized as to language, two by Baumbach and one by Mörike reprinted essentially in the original form. Besides these carefully graded pieces, there are a dozen well-known poems, mostly of a legendary character. Questions in German and narrative paragraphs for retranslation into German follow the texts. A further useful feature is a series of words upon which pupils may exercise their memory. The excellent vocabulary makes notes to the text unnecessary.

A manual for the teaching of German according to the direct method inevitably seems complicated, and its innumerable questions and answers, proper and natural in oral use, seem out of place in print. Examination of such a book is seldom cheering. It may be said, however, of W. D. Zinnecker's "Deutsch für Anfänger" (Heath; $1.25 net) that the material basis of the instruction is not uninteresting, that this material is thoroughly elaborated, and that a discreet use of English for explanation and translation encourages the teacher to modify his "directness" so far as may be expedient. An appendix contains a brief but clear chapter on German phonetics, a tabulation of grammatical forms, and sundry vocabularies.

The third issue of Calvin Thomas's edition of "Hermann und Dorothea" (Holt; 60 cents) is virtually a new book and is an excellent example of well-proportioned directness. The editor adopts Kullmer's identification of Pössneck in Thuringia as the little town from which Goethe derived the local color for the scene of his story. The historical antecedents of the plot are briefly set forth, and there are judicious remarks concerning the style and form of the epic. The notes and vocabulary leave nothing to be desired.

Prof. Arthur H. Palmer's edition of "Wilhelm Tell" has been entirely reset and revised, and is now put forth as a suitable text for secondary schools (Holt). Introduction, vocabulary, notes, and a new section of *Fragen*, prepared by Prof. Charles M. Purin, furnish a most serviceable apparatus for teacher and student alike.

Paul V. Bacon's "Vorwärts" (Allyn & Bacon) resembles the author's "Im Vaterland" in method and in general appearance, but is more elementary and, as a German reader for beginners, is more obviously graded. Systematic drill in the principal points of syntax is unobtrusively woven into the text, and equally systematic repetition of words and expressions, though it does not enliven the narrative, serves to fix essentials in mind. Enlivenment is sought rather in the actuality of the substance and the profusion of illustrations, many of which are evidently from original photographs. The book is unmistakably a skilful compilation.

"Herder and Klopstock," by Dr. F. H. Adler (Stechert; $1), is a comparative study which aims to present in a new light the relations of these two notable forerunners of Germany's greatest literary period. The author shows how the new world of ideas created by Klopstock found sympathetic response in Herder, and how the latter, by his precept, vindicated the rights of imagination, of the Germanic spirit, and of that type of religion which is focussed on humanity rather than on theology. The last section of the book contains a more detailed and technical study of the poetic language of the two men. Dr. Adler is to be congratulated on his unflagging enthusiasm for his subject; there is never even the slightest intimation of the turgidity and pedantic heaviness which characterize the poetry of Klopstock and render it so utterly unenjoyable to most modern readers. The larger bearings of the subject—for instance, in connection with the Romanic Movement—are only cursorily indicated.

ITALIAN.

An Italian Dictionary. By Alfred Hoare. Cambridge: University Press; New York: G. P. Putnam's Sons.

The many readers who have long been baffled or disappointed by the existing Italian-English dictionaries will welcome Mr. Alfred Hoare's work. It is a strange and by no means a creditable fact, that while excellent dictionaries have been available for English-speaking students of French, Spanish, and German for half a century or more, Italian has been neglected. To say, therefore, that Mr. Hoare's is the best might not mean much if "best" were construed relatively. But judged by any standard, it is an admirable lexicon.

Mr. Hoare's chief aim is to make it as practically useful as possible. With this in view, he resorts to many original devices. For instance, he endeavors to grade words according to the frequency with which they occur in the spoken or written language. He places first the commonest definition, next the rarer or dialect meaning, and finally the obsolete use. And to enable the reader to perceive at a glance these distinctions, he employs different fonts of type, as well as various symbols. It may require a day's practice to get used to these devices of his, but when they are once learned their reasonableness is recognized, and they save much time.

Mr. Hoare does not attempt to give all the words, living or dead, in the Italian language; but he does give those which the reader of either current books and newspapers or of the classical Italian authors is most likely to meet. Of course, there can never be an absolutely exact line drawn with any such classification, and no doubt each reader will look in vain in Mr. Hoare's Dictionary for words which he expected to find there. But on the whole the inclusions are very comprehensive, and the exclusions have generally a valid reason.

Among Mr. Hoare's points of excellence is the attention he has devoted to pronunciation. By the use of easily understood accents he makes clear, not only the syllabic emphasis of each word, but also the open and close sounds of *e* and of *a* and the two sounds of *zz*. His devices for indicating diminutives, augmentatives, etc., are clearly thought out. For a work in which compression is carried as far as possible without resulting in the puzzles which some etymologists put before us, this Dictionary quotes a considerable number of illustrative passages, Dante being naturally the chief authority cited.

Wherever we have tested the Dictionary we have found it satisfactory; and this is true also of the appendix, in which Mr. Hoare furnishes an English-Italian vocabulary, much briefer than the other part, but still sufficient for the needs of the average reader.

We regret that this work should not have been issued in a smaller format and at a price within reach of the purses of all those who would like to own it. The broad quarto page, with its clear type, is handsome, but an octavo would have permitted the production of a volume more convenient and less expensive.

Professor Grandgent's "Italian Grammar" (Heath; $1 net), since its first appearance in 1887 *facile princeps* in its field, has undergone a thorough revision both by its author and by Prof. E. H. Wilkins, of Chicago, who has provided a new set of forty-one exercises, a vocabulary, and a useful note on reading Italian verse, with examples from Pascoli and Carducci. The new exercises are a model of their kind, particular ingenuity being shown in the sentences, which not only aptly illustrate points of grammar, but are agreeably free from the artificiality and feebleness of sense that few compilers of grammars seem able to avoid. In its revised form this excellent book should long prove useful to students of Italian.

SPANISH.

The brothers Serafín and Joaquín Alvarez Quintero are among the best of contemporary Spanish playwrights. In editing their "Doña Clarines" and "Mañana de Sol" (Heath; 50 cents net), Prof. S. Griswold Morley has made available for American students two of the brightest playlets which have been produced recently in Madrid. The first of these, a comedy of character, has for its heroine a spinster who speaks the truth on all occasions regardless of consequence. To render so formidable a personage sympathetic and dignified without losing an opportunity for comic effect demands delicacy of treatment; but the brothers Alvarez have succeeded in making the all too candid Doña Clarines as likable as she is disconcerting. "Mañana de Sol" is a charming little one-act idyl. It represents the meeting in old age of two former lovers. Like many other humorists, the Alvarez excel in pathos. Both these texts provide idiomatic Spanish, sufficiently simple to be used early in the course. The notes and vocabulary leave nothing to be desired.

RUSSIAN.

The study of Russian is still in its infancy both in England and America, so that no series of textbooks has been developed to meet the wants of students. The book that is best adapted to classroom use is the "Russian Conversation-Grammar" of Pietro Motti, a volume written by an Italian who was imperfectly acquainted with English and still more imperfectly with Russian; naturally it is crammed with mistakes. The "Russian Reader," composed for French students by Boyer and Speranski, on the basis of Tolstoy's tales for peasant children, and translated and adapted for English use by Professor Harper, is admirable in plan and, except for a few insignificant slips, in execution; nothing better of its own sort could be desired. But some elementary introduction to Russian grammar must be used with it. To supply such an introduction seems to have been the aim of Dr. Nevill Forbes in his newly published "Russian Grammar" (Oxford University Press; $2), if one may judge from his own words in the preface:

> The accompanying volume is a practical rather than a scientific grammar. It is intended for the use of those students who are working under a teacher able to explain the difficulties of the language to them, and also for the use of those who are working at the language by themselves with the object of being able to read it; but it does not profess to be an adequate means of teaching any one working alone how to speak Russian.

The book itself hardly corresponds to this statement of purpose. It is of the same general type as the familiar Latin grammars, such as that of Allen and Greenough, on which generations of American boys have been brought up. From the point of view of a Slavic philologist it is elementary; from that of a learner it is an advanced work, and, without a graded lesson-book to accompany it, a bewildering treatise. It aims to answer most of the practical questions that would occur to readers of modern Russian authors. Dr. Forbes can hardly be blamed that his book is less clear and logical in its arrangement and in its phrasing of rules than Latin grammars that have been continually revised. He deserves a severe rebuke, however, for not providing any index whatever; to make the volume thoroughly useful both a Russian and an English index would be required. This is no place for detailed criticism of Dr. Forbes's work. The reviewer has found a few statements that are mistaken, and many that seemed to him misleading or clumsy in expression; to be specific, the section on relative and interrogative pronouns is by no means adequate. But as a whole, the grammar is so far superior to any that has hitherto been published in English that cavilling criticism would be ungrateful. One may hope that Dr. Forbes will now proceed to construct a graded lesson-book that will replace that of the egregious Motti. If he should make it specially adapted as an introduction to the Boyer and Speranski reader, the gain would be even greater.

PERSIAN.

A brief introduction to the study of Persian, in German ("Persische Erzählungen, mit Grammatik und Glossar) by Georg Rosen, remodelled by Friedrich Rosen (Leipzig: Veit & Co.), has just appeared. It contains a capital little grammatical sketch, compressed into thirty-five pages. Each word in the original Persian characters is transliterated also into Roman letters. Then follow some fifty pages of short stories in prose for translation, accompanied by an excellent glossary; and appended at the end are a few brief selections from classic Persian poets. The beginning might have had further help through being given an inkling in a word or two as to the short stories that make up the body of the book; but the whole work serves as an admirable introduction to the language and does credit to its later editor, who is not only a Persian scholar but a diplomatist as well, for he is the Ambassador of the Imperial German Government to Spain.

GOVERNMENT AND ECONOMICS.

To those college teachers of political science who wish to put into the hands of their students a book that tells what our Government does as well as what it is the volume on "The New American Government and Its Work," by Prof. James T. Young, of the University of Pennsylvania (Macmillan), will make a special appeal. As a textbook it has several features which distinguish it from others of its kind. For one thing there is an uncommonly full discussion of the powers of Congress and of the ways in which these powers reach the citizen. Judicial decisions are cited profusely, the author's design being, as he states in the preface, "to lend more reality, vividness, and clarity to a subject that is already beset by too many generalities." The prominence given to these decisions is especially marked in the chapters devoted to Federal and State regulation of commerce. Another commendable feature of the book is its comprehensive treatment of State administration, a subject which too many surveys

of American government have passed over without adequate presentation. Social legislation, likewise, and the whole economic side of governmental activity have received the emphasis which their growing interest and importance warrant.

On the other hand, there are some serious omissions. The book contains little or no historical discussion, nothing about the antecedents of American government. Most teachers of political science believe that their students should first learn something about the way in which American government came to be before they plunge into the subject of what it is and does. More unfortunate still is the author's failure to include in the volume any consideration of municipal government in this country. That is an omission which surely should have had a word of explanation. In his endeavor to "picture the new government as it serves and helps the people" Dr. Young might well have drawn fine material from our municipal happenings of the last ten or fifteen years. The style of the book is clear and vigorous; there is no theorizing or chasing of political will-o'-the-wisps. It is hopeful in tone, yet never lapses into that shambling eloquence which too often mars the pages of such books. There are useful aids to teaching, including references for further reading and questions upon the text. The index, however, is ridiculously inadequate.

"An Introduction to the Economic History of England, I, The Middle Ages" (Macmillan; $2.50 net), is the first volume of what promises to be a valuable book for students of English history. The author, E. Lipson, of Trinity College, Cambridge, has embodied in some five hundred closely printed pages the most recent investigations of scholars in regard to the rise and fall of the manorial system, the merchant and craft guilds, fairs and markets, the beginnings of England's foreign trade, and the main features of the English revenue and exchequer system. But he does more than merely summarize the researches of others. His pages are full of interesting concrete examples and quotations from mediæval statutes and political poems. Students will be grateful to him for the numerous footnotes in which he indicates the sources from which his examples are drawn. In dealing with controversial points he shows good judgment in the opinions which he adopts and fairness in his statement of the views which he rejects. He rightly recognizes that most mediæval institutions are the result of complex factors and cannot be explained satisfactorily by a few brief formulas. Thus, as to the origin of the manor, he does not adopt exclusively either the Roman theory of Seebohm or the Teutonic view of Stubbs, but shows the probable influence of both Roman and Teuton factors. The chapter on the craft-guilds, over a hundred pages long, and perhaps the best in the book, gives a more rosy view of mediæval guilds than one usually finds. Incidentally the author sees a good deal of evidence of the activity of women in industry and trade. "There seems no adequate ground for the view that working-women were mainly 'unpaid domestic workers' following household occupations, rather than wage-earners supplying a market" (p. 317). In the excellent chapter on "The Woollen Industry" he notes the appearance of the word "blanket" in a Pipe Roll of 1182. This is more than a century before the earliest date given in Murray's Dictionary, and long before the time of that Thomas Blanket, bailiff of Bristol in 1340, who is popularly supposed to have given his name to a kind of woollen. Though entitled an "Introduction," this volume rather presupposes some knowledge of English history. It is more like the well-known economic histories of Ashley and of Cunningham than those of Gibbins and Cheyney.

HISTORY.

AMERICAN.

The four-volume "Riverside History of the United States" (Houghton Mifflin; $1.25 net, each) meets, on the whole, better than any other work of equal compass now on the market, the needs of readers who desire a comprehensive and well-written narrative, scholarly enough to command the respect of critics, and detailed enough to furnish particular information on important points, while at the same time sufficiently broad in scope and treatment to afford an intelligent view of the period as a whole. In such a work, novel content would be out of place; nevertheless, by emphasizing economic and social questions, State politics, and the development of the West more than was once customary, the authors have succeeded in giving freshness to the account of a number of episodes. There are differences both in manner and in success, of course, as is to be expected in a work by different hands. Professor Carl L. Becker, who writes on the "Beginning of the American People," is more at home, apparently, on the side of the European influences which affected colonial development than he is on the side of colonial history itself; and his volume, though possessing exceptional literary merit, is not so notable in content. Prof. Allen Johnson's "Union and Democracy," on the other hand, carrying the narrative from the close of the Revolution to the beginning of Jackson's régime, is an admirable sketch of the establishment of Federal Government and administration, the formation of parties and the evolution of their policies, and the peculiar problems, sectional and local, of the early West. Prof. William E. Dodd, the editor of the series, who writes on "Expansion and Conflict," is at his best in treating the economics of slavery, State politics, and sectional issues. The last volume, by Prof. Frederic L. Paxson, entitled "The New Nation," offords a good view of the period since 1865, notwithstanding that it is weak on the constitutional side, and suggests rather than exposes the deeper foundations of contemporary politics. The reading lists appended to the several chapters show praiseworthy discrimination. Most of the maps, unfortunately, are so small and so poorly executed mechanically, as to make their use difficult: a fact the more to be regretted because the maps themselves represent much labor, and in themselves are both fresh and informing.

COLONIAL.

An excellent example of good work along somewhat technical historical lines is to be found in a monograph by Elmer Beecher Russell, entitled "The Review of Colonial Legislation by the King in Council" (Longmans, Green; $1.75). The subject is not likely to be familiar to the average reader of Colonial history, but the prominent place that it occupies among the grievances presented in the Declaration of Independence, where it forms the basis of no less than eight indictments, is sufficient to warrant careful investigation into its character and influence. Though Mr. Russell has not attempted to cover the entire field, he is to be congratulated on the thoroughness of his effort as far as he has gone. He has presented in a detailed and well-organized fashion the results of much scholarly research among records that are only in part available in this country, and has made abundantly clear the general truth that in this respect, as in many others, the Colonists were more or less unconsciously resisting a policy that placed the royal prerogative and the commercial welfare of England ahead of their own political and economic development. How far such development was actually checked by the exercise of the royal right Mr. Russell has not attempted to discover, but he has gone far enough to indicate wherein the grievances of the Colonists lay. That the King deserved to be indicted for "tyranny" because of the exercise of this right is another question.

No small part of the contribution that Mr. Russell has made lies in his presentation of the reasons underlying the royal policy, a policy that appeared to British statesmen as fundamentally necessary for the Empire. That the Colonists should have construed this policy as a severe infringement on liberty seemed incomprehensible to the somewhat opaque British mind. Mr. Russell's essay is rather better written than the average doctor's dissertation, but it is marred here and there by certain usages that are incorrect. The terms "attorney and solicitor" and "attorney and solicitor-generals" are never used for the "attorney and solicitor-general" or the "attorney-general and solicitor-general"; and the title "King's Counsel," here used as if it belonged exclusively to the standing counsel of the Board of Trade, shows that Mr. Russell is unfamiliar with the meaning of the letters K.C. or with the distinguishing British practice of "taking silk." We think, also, that the phrase "legislative review," as an abbreviation of the title of the monograph, is incorrect, in that the Privy Council has never been a legislative body and its acts, whether of review or otherwise, cannot be termed legislative. We call attention to these errors, for they are frequent throughout the work.

HISTORICAL COLLECTIONS.

Some years ago the Illinois State Historical Library wisely placed the editing of its Collections in the hands of a scholar who knows well the history of the Old West, and who can write about it with sympathy and clarity. Again Dr. Clarence W. Alvord (this time in collaboration with Professor Carter, of Miami University) has placed students of Western history under deep obligation for his excellent work in editing Volume X of these Collections (Springfield, 1915). The volume is entitled "The Critical Period, 1763-1765," and forms No. 1 of the British Series. It is the forerunner of four or five others, soon to appear, on the same subject. The documents here presented have been selected with care from the archives of the United States, Canada, England, and France. Those written in the French language are given in the original and also in English, the translations occupying the lower half of the page. As in other publications of the Illinois State Histori-

cal Library, the papers are divided into chapters, "for the purpose of breaking up that monotony so characteristic of such collections of documents." There is a general introduction on "British Illinois, 1763-1778," which is followed by a special introduction on "The British Occupation of the Illinois Country, 1763-1765," a useful study of an interesting phase of Illinois history illustrated by the rich documentary material contained in the volume. A similar study, presumably from the same hand, will be included in each number of the series. The annotations are sufficiently ample to elucidate obscure points and to supply necessary bibliographical and biographical data. The volume is well printed and has a charming view of Kaskaskia, portraits of Sir William Johnson and Gen. Gage, and two facsimile reproductions. Best of all, the index can be relied upon.

The seventh volume of the Proceedings of the Mississippi Valley Historical Association, printed by the Torch Press, is, on the whole, a very creditable publication. It contains at least two or three papers which will place it distinctly above mediocrity. Prof. James Alton James's consideration of "Some Phases of the History of the Northwest, 1783-1786," is especially worthy of note. It will not be surprising, however, if Dr. Clarence W. Alvord's "Critical Analysis of the Work of Reuben Gold Thwaites" should attract more attention than any other paper printed in the volume. Many years before his lamented death in 1913, Dr. Thwaites had earned a national reputation as an earnest and energetic worker in the field of Western history. He not only built up a great historical society and library, but by his unbounded enthusiasm and genius for organization did more than any other man to popularize and make possible the serious study of history in the Middle West. As a writer and as an editor of source materials, Dr. Thwaites was most prolific. In a period embracing somewhat more than a quarter of a century he wrote fifteen books, and edited and published about one hundred and sixty-eight volumes. The task which Professor Alvord undertakes to accomplish is fairly to appraise this remarkable output; in short, to establish, if possible, Dr. Thwaites's standing as an historian. Dr. Thwaites was not a great historian, and produced no work which will find a place with the best historical writing. Mr. Alvord has performed a rather delicate task in a becoming manner, and with the sure touch of one who knows his subject well. Fortunately, Dr. Thwaites accomplished so much in addition to his literary labors, and was so lovable a character, that he will long be remembered and honored.

The Proceedings of the Wisconsin Historical Society for 1914 (Madison, Wis.) contains Mr. Worthington C. Ford's address, "The Treaty of Ghent—and After," delivered at the regular annual meeting of the Society. As editor of the "Writings" of John Quincy Adams—a task which is still in the course of distinguished accomplishment—Mr. Ford can speak with authority on the subject of the Ghent treaty. His paper is notable for two reasons: it is a careful and illuminating study, and it is written with a lightness of touch that is almost sprightly. As was to be expected, he has made the best possible use of the personal incidents of his theme. Two other contributions to the volume are noteworthy: "Henry Hay's Journal from Detroit to the Miami River" (1789-1790), edited with introduction and notes by Milo M. Quaife, and "A Semi-Historical Account of the War of the Winnebago and the Foxes," by Dr. Paul Radin, of the Geological Survey of Canada. Hay's "Journal," which Dr. Quaife has edited in a skilful manner, is both valuable and interesting. The journalist spent several months with the Indians and their French and British partisans on the site of the present city of Fort Wayne, Ind., and the "Journal" reflects, in varied details, the life of this old settlement as it was in the last decade of the eighteenth century. The legend recounted by Dr. Radin is printed in both English and Winnebago. Of local interest are Eben D. Pierce's account of James Reed, a Wisconsin pioneer, and J. H. A. Lacher's pleasing paper on "The Taverns and Stages of Early Wisconsin." Typographically, the volume is not creditable to the State Printer who produced it.

The most important paper in Volume XVIII of the Buffalo Historical Society Publications is an account of the peace congress at Niagara Falls, in 1914, by Frank H. Severance, the editor of the volume. While necessarily based mainly upon newspaper reports, the paper is as full and authoritative an account of what took place as is likely to be written until the various Governments concerned release their diplomatic correspondence on the subject. The texts of such documents as were made public at the time are included. Mr. Severance also contributes a sketch of Ephraim Douglass's peace mission to the Indians at Niagara, in 1783, together with a narrative of Brig.-Gen. Alexander Smith's spectacular performance on the Niagara frontier during the War of 1812. The latter includes letters hitherto unpublished. An interesting addition to the sources of American economic and social history is made in a translation, by H. F. DePuy, of this city, of "Le Pour et le Contre," a rare compilation by Louis Bridel, pastor of the French church at Basle, published at Paris in 1803. The work is especially valuable for its bearing upon the operations of the Holland Land Company in western New York.

The nineteenth volume of the University of Toronto Studies, being a "Review of Historical Publications Relating to Canada" covering the year 1914, is, as the title suggests, a collection of book reviews and notes, and these have been written by a wide range of authorities in their respective fields. The book embraces nearly two hundred and fifty compact pages, comprising upwards of two hundred carefully written themes, varying in length from a few lines to several pages. The material is classified under six different headings, dealing respectively with Canada's relations to the Empire; the general history of Canada; local history, including the history of the various provinces; geography, economics, and statistics; anthropology, ethnology, and folklore; and education, ecclesiastical history, law, and bibliography. Somewhat more than half of the volume is devoted to history, provincial and local, geography, economics, and statistics. The publications reviewed are of a great variety, including books, essays, magazine articles, addresses, Government reports, etc. Although much of the material is chiefly of local interest, there are reviews of numerous volumes well known to all who are familiar with Canadian literature, such as Shortt and Doughty's "Canada and Its Provinces: A History of the Canadian People and Their Institutions," Tupper's "Recollections of Sixty Years in Canada," Douglas's "Lands Forlorn: A Story of an Expedition to Hearne's Coppermine River," and Bryce's "A Short History of the Canadian People." On the whole, it is fair to say that the book constitutes a reader's guide to Canadian literature for the year 1914, rather than a volume of literature in itself. The editorial work was performed by Prof. George M. Wrong, of the department of history in the University of Toronto, H. H. Langdon, librarian of the same institution, and W. Stewart Wallace, lecturer in history in McMaster University, Toronto.

PHILOSOPHY.

PSYCHOLOGY.

Prof. Charles H. Judd's "Psychology of High School Subjects" (Ginn; $1.50) is less a formal treatise upon educational psychology than a critical summary and discussion from the point of view of the psychologist, of the views put forward by supposedly unpsychological persons interested in the teaching of special subjects. The book is thus on the whole a comprehensive and informing discussion of the issues involved in high school pedagogy, stimulating to the reader in spite of a monotony of style and a fondness for sentences in which "one" is followed by "he." On the other hand, it is a question whether the illumination afforded by "the psychologist"—as such—is sufficient to justify his magisterial tone. Surely no special powers are needed to tell us, for instance, that the tendency towards specialization is connected with the natural limitations of human attention. Nor are the reforms called for by Mr. Judd's special type of psychology altogether clear. Granting, for example, that words stand, not for passive associations, but for attitudes of behavior, what does this show but the fact, never forgotten by more discriminating teachers of language, that the meaning of words varies with persons and with situations? And when we learn that the difference between reflective and practical men, or, in Mr. Judd's terms, theoretical and practical men, is that the former are given to word-reactions, the latter to hand-reactions—a sad blow, by the way, to the practical pretensions of the commercial classes—we are compelled to wonder whether psychology has not taken wings and flown away. Apparently "the psychologist" is no longer able to distinguish between a word and a sound, between thinking and mere talking.

Like most psychologists, Mr. Judd appears to think that scientific insight is shown by viewing the mind as a machine-shop in which the several machines run independently of one another. Thus he is constant in warning teachers that (1) mere recognition of an object or mere skill in handling an object, (2) theoretical analysis, and (3) practical application are "different mental processes." Now it is true that the so-called mental processes of students often appear to illustrate this sort of independence—when, for example, a student who is supposed to have mastered the Pythagorean theorem is unable to lay out a tennis court. But the question is whether such practical disability is not a mark of superficial theoretical analysis. And, on the other hand, as against the traditional view that analytic consciousness deserts an operation of which the technique has been

thoroughly mastered, which Mr. Judd accepts uncritically, we may suggest that the motorist who fails to retain a clear idea of how he controls his machine is doomed to destruction. It is at least as reasonable to suppose that the leisure to enjoy the landscape which comes to the practiced motorist is due to a larger "presence of mind," which enables him to keep in mind both the landscape *and* the machine, as to a transfer of mind from one object to the other. And so far as his skill is wholly unanalytic, one may ask whether it stands for any mental operation whatever.

The point has a broad application to educational theory. From the emphasis laid by the behavior psychologists upon "economy of thought," one must suppose that the purpose of education is to enable the student to get along with as little thinking as possible. Here he is to be trained in manual skill, there in practical application, and only upon special occasions is he to be trained in "analysis." Our query is whether the cultivation of a thoughtful and analytic doing of things is not the beginning and end of all education; and whether, again, this analytic attitude is not the one thing that makes all of the "different mental operations" mental.

And we may further ask whether this is not at bottom the real virtue of the plan of "generalization" which Mr. Judd offers as a remedy for the present confusion of aims in the high-school curriculum. It has been suggested by others that, as a foundation for courses in the sciences, we should have a general course in "science"; Mr. Judd proposes similar courses in mathematics, in which the boundaries of algebra and geometry are to be more or less disregarded, and in language. The idea seems a promising one. When scientific men contend for the sacredness of the boundaries of the sciences, it is proper to remind them that the sciences have been marked out, not by nature, but by man, for human convenience; and that for educational convenience—if a general course in science will afford at once a broader view and a deeper insight—these boundary lines may, if we like, be reconstructed or annulled. Yet it is permissible to ask whether the idea is quite as new as it is even reactionary. When Mr. Judd outlines his general course in language, on p. 245, one is reminded strongly of the traditional function of Latin.

"Psychology and Parenthood," by H. Addington Bruce (Dodd, Mead; $1.25), is a book of 279 pages, filled with wide margins, interesting facts, good advice, and pleasant stories. It is always easy reading, and if ever interest wanes, appeal is made at the critical moment to the marvellous subconscious, with which the author has learned by long practice to conjure with great skill. Mr. Bruce holds that the environment is of much more importance in determining the child's character than is heredity; that unconscious suggestion has much greater influence upon him than the average parent supposes; that genius is the power to appropriate the remarkable resources of the subliminal, and hence is to a surprising degree capable of cultivation; that "intensive child culture" from the age of two or three upwards can often produce results commonly but mistakenly ascribed to extraordinary ability; and that life-long characteristics of an undesirable nature, such as laziness, and even nervous disorders, such as hysteria and phobias of various sorts, are often due to incidental suggestions, to slight physical disabilities, or even to mere habits originating in childhood—all of which may be easily avoided or overcome by proper care on the part of the parents. Though some of Mr. Bruce's conclusions are open to question, his book will be found valuable by many a parent for its excellent practical suggestions, based as they are upon a wide reading of recent psychological and medical literature.

No alterations occur in the eighth edition of William McDougall's "Introduction to Social Psychology" (John W. Luce & Co.), but there is added a supplementary chapter on sex instinct. Sex experience and conduct afford, the author thinks, the most obvious support of his main theory, viz., that human activities are to be traced back to a number of instinctive tendencies which manifest themselves independently of previous experience. He explains why he has not treated of sex instinct heretofore, largely, he says, by reason of the difficulty of so doing, in a book for the general reader. What the author states dogmatically, and without his usual recourse to the "perhaps" "not improbably," or the "doubtless" or "no doubt" (which mean there is some doubt), is generally acceptable enough, though not particularly startling. But when he goes on to refine and suggest, and to imagine hypothetical cases, in the manner of the philosopher or introspecting psychologist, that must be meant for the "general reader," who is credited, supposedly, with a liking for easy and interesting guesswork of the poetic order. One example will do for illustration: "That sex love should thus combine the most purely altruistic [?] with the most ruthlessly egoistic tendency of human nature . . . is [in the man] perhaps sufficiently accounted for by the fact that woman, especially at the age at which she is most strongly attractive to man, resembles in many respects, both mental and physical, the child, the normal object of the parental or protective impulse." Sex energy can be "long-circuited" and "sublimated" in "the service of intellectual, moral, and æsthetic development"; in the normal child, the sex instinct awakens at about the eighth year; but sex enlightenment in youth is dangerous, for "knowledge may be more dangerous than ignorance"; female coyness is essentially bashfulness on occasion of male approach and pursuit; and bashfulness "seems to be essentially the expression of a conflict between the opposed instincts of self-display and self-abasement"—these are samples of opinion and treatment. The author seems to attach a significance to sexual selection that some modern experiments appear to render unjustifiable. The style flows copiously and monotonously under the benignant imminence of an owlish gravity. Some of the pages are narrower than the rest by a quarter of an inch, giving the volume an unfinished appearance as one pages it over.

SOCIOLOGY.

To write a textbook on sociology is a particularly difficult task, partly because the subject is so new that it has as yet few formative traditions, and chiefly because the subject is so amorphous and so lacking in clear-cut outlines that every Outline of it is necessarily in danger of being either too narrow or too vague. Profs. F. W. Blackmar and J. L. Gillin, whose "Outlines of Sociology" has just been published by the Macmillan Company ($2 net), have tried to steer a safe course between these two dangers, and with some success. They have written a book which will give the student a fair idea of the entire field of sociology as it exists to-day, and they have not yielded to the temptation of wandering too far into the other social sciences. Whether they have even crossed the boundary line of these adjacent territories it would be impossible to say, inasmuch as boundary line there is none. The chief criticism to which the book lies open is less a criticism upon Messrs. Blackmar and Gillin than upon the nature of their chosen "science." Their book gives the reader a very excellent idea of sociology; and what is this idea? A rough analysis of this—as of any other good textbook on the subject—will show that sociology consists of two elements: the one, a valuable group of facts borrowed entire from various other studies, such as history, geography, economics, government, psychology, ethics, "comparative religion," etc.; the other, a group of generalizations and laws which sociologists have drawn from these facts. The two groups are of very different degrees of value. The first, although invariably intermingled, in sociological works, with a great mass of commonplace, does at least bring to the reader a good deal of important and fresh information—provided always that he has himself done no work in the various other sciences from which the information has been borrowed. The principal new knowledge to be derived from the second element, on the other hand—the generalizations and laws contributed by the science of sociology—consists very largely in the definition of various technical terms invented by the sociologists themselves. There are, for instance, in the book under review nearly ten chapters in which the average intelligent man or woman, hitherto innocent of sociology, will find practically nothing new, besides the definition and manipulation of a number of terms ending in *ation*. To the reviewer, at least, it seems plain that both sociology in general and Blackmar and Gillin's textbook in particular would be considerably improved if almost a third of their present contents were quietly deleted. For both the book and the "science" have value, that value consisting in the bringing together of wide groups of facts from varied fields, which, though they have instructive bearings on each other, are never actually placed side by side except in the works of the sociologists. From this point of view Professors Blackmar and Gillin have produced an excellent textbook, and one which deserves a wide use in college classes and by private students—provided, indeed, that sociology has to be studied at all.

RELIGION.

In "The Doctrine of God in the Jewish Apocryphal and Apocalyptic Literature" (London: Hunter & Longhurst; 10 shillings net) Dr. Henry J. Wicks offers a valuable handbook for the study of the literature in question. He has gone critically through all the Jewish non-canonical books from the second century B. C. into the first century A. D. and tabulated their ideas, in chronological order as far as possible, concerning God's transcendence, justice, and grace. His volume throws a welcome light on a little-known but very important

period of Jewish religious development. The general reader will doubtless be surprised to find so much similarity between the conceptions of the works here described and those of the New Testament. Wicks's volume, indeed, furnishes material for bridging over the gulf which has been largely held to separate the two Testaments.

Nothing helps better to clear up our conception of the significance of current religious ideas than such a sketch of their development as is given by Prof. A. C. McGiffert in "The Rise of Modern Religious Ideas" (Macmillan; $1.50). After pointing out briefly the conditions that led to the religious disintegration of the seventeenth and eighteenth centuries, Dr. McGiffert discusses at greater length the process of the reconstruction of faith as it is exhibited in the great philosophical works and the great scientific theories. He finds the general result of this movement to be the emancipation of religion from the crudities of the church creeds and its exaltation into the region of free and vital convictions. The volume may be recommended as giving an admirable picture of the higher religious thought of the last two or three centuries.

Alongside of the description of philosophical and scientific movements it is desirable to consider how far the religious beliefs of the Christian masses have been affected by the modern progress of knowledge. This question is treated by President-Emeritus George Harris, of Amherst College, in "A Century's Change in Religion" (Houghton Mifflin; $1.25). Dr. Harris finds that, while interest in religion has not been diminished, there is a perceptible movement away from dogma towards spiritual conceptions. In the same line is Rev. Dr. Josiah Strong's "New World Religion" (Doubleday, Page; $1.50), which finds the universal religion in Social Christianity, service to humanity under the guidance of the teaching of Christ. Both these volumes are characterized by reasonableness, reverence, and spirituality.

Among the significant developments of recent religious thought is the disposition in certain quarters to suggest modifications in the conception of the function of the church. In various ways stress is laid on the great work it may perform in the service of humanity by appealing to and fostering moral ideals in daily life. Thus, under the title "In the Service of the King" (Putnam; $1.25), J. B. Dunn gives a "parson's story" of his not unsuccessful efforts to awaken the spirit of Jesus in the minds of persons not particularly gifted or in any way remarkable. Rev. E. S. Ames, in "The Higher Individualism" (Houghton Mifflin; $1.10), points out the social nature of the individual, and the value of religious experience. W. H. Carnegie, Canon of Westminster, in "Democracy and Christian Doctrine" (Macmillan; $1.25), shows how the church may encourage in all grades of life those social virtues that are essential to the permanence of a democratic society; in passing he says a good word for Russian religion. More distinctly P. M. Strayer, in "The Reconstruction of the Church" (Macmillan; $1.50), affirms that the true function of the church is not to preach doctrine, but to teach and train men to love righteousness and to go about doing good. A hint of sympathy with this view may be discovered in J. S. Auerbach's "The Bible and Modern Life" (Harper; 75 cents), which, however, is primarily an exposition of the beauty of Old Testament poetry. It is a useful book notwithstanding some exaggerations.

For younger students of the Bible we have "The Songs, Hymns, and Prayers of the Old Testament" (Scribner; $2.75), by Prof. C. F. Kent; "Geographic Influences in Old Testament Masterpieces" (Boston: Ginn; $1), by Laura H. Wild; and "History of the Hebrews" (Scribner; $1), by President F. K. Sanders. These are carefully written and trustworthy books. In contrast with these we may cite, as an example of extremely regrettable writing, "The Making of Christianity, an Exhibit of Hebrew and Christian Messianic Apocalyptical Philosophy and Literature" (Alton, Ill.: G. P. Clark; $1.25), by Dr. John C. C. Clarke. By treating numbers as symbolical (a fruitful source of vain fancies) and by other discredited methods of interpretation the author constructs a "Hebrew Apocalyptic System" which he represents as the source of Christian ideas, and he has the extraordinary assertion (p. 14) that "no book in the Bible or in the world's literature has exercised or now exercises so immense an influence on human thought, study, and faith as St. John's Apocalypse." It is a misfortune for this interesting, but not mysterious, book to be made into an arsenal of predictions and other cryptic utterances.

SCIENCE.

MATHEMATICS.

The "Elementary Algebra" (Allyn & Bacon; $1 net), by Professors Slaught and Lennes, is an attempt by ripe mathematical scholars to cover the work of the first year in algebra, with due regard to simplicity, the need of plenty of carefully graded exercises, the requirements of college entrance, the traditional order of topics, and the desirability of frequent reviews. The value of the book is enhanced by the device of marking parts to be omitted, without loss of continuity, by any who may desire a shorter course. Another commendable feature is the presence of good portraits of well-known mathematicians, along with some account of them. The pupil will not have to unlearn what he is taught by this book, but it seems a pity that the teaching should take so many pages.

In Reeve and Schorling's "A Review of High-School Mathematics" (University of Chicago Press; 40 cents) we have 64 carefully prepared pages designed for use by pupil and teacher in reviewing the algebra and geometry presented in a three-year high-school course. There are appended some useful suggestions respecting what is called "A Tentative Minimum Course in First-Year Mathematics" and kindred matters.

A glance over the pages of Breslich's "First-Year Mathematics for Secondary Schools" (University of Chicago Press) is sufficient to confirm the encomium passed upon it by the editors of the series of which it forms a part. After indicating both the purposes held in view and the great pains devoted to the carrying out of those purposes in the most effective way, they close their preface with the expression of the conviction that "this new book will contribute to the solution of the problems which confront the mathematical sciences in their efforts to be a vital part of the new course of study in American high schools." When it is added that the editors who sign the preface are Profs. Eliakim H. Moore, George W. Myers, and Charles H. Judd, it might be natural to remark that their praise needs no confirmation; but what we have in mind is the attractiveness of the arrangement, the variety and judiciousness of the illustrative examples, the pleasing typographical appearance, and other features which are easily perceived in turning the pages. One unessential but yet valuable feature is the portraits of illustrious mathematicians, with biographical sketches, interspersed through the volume. A general purpose running through the whole is that of using experimental or inductive geometry as a stepping-stone to the deductive science. In the circumstance that an American mathematician of the preëminent rank of Professor Moore has taken so keen an interest in the pedagogical aspect of his profession—it is to his presidential address before the American Mathematical Society in 1903 that the impulse towards this change in mathematical teaching in the schools is largely due—there is to be found a parallel to the similar activities of Professor Klein, one of the foremost of German mathematicians.

Robbins's "New Plane Geometry" (American Book Co.) is physically and typographically good. Scientifically, didactically, and stylistically it is rather commonplace. It begins by telling the reader that measurement is the concern of the science. A host of old definitions are given that play no rôle in subsequent argument. Vertex is defined in terms of vertex. The obsolete conception of axiom is present, as is also the old false statement as to the relation of whole and part. We are told that a magnitude may be "displaced" by its equal in any process, and that a postulate is "something required to be done." On page 8 we learn that a theorem requires proof, but on page 20 we are told that the most converse theorems are false. Two definitions of limit are given (pp. 96 and 97). Neither of them is in good use. Like any other textbook of geometry, this one contains many statements that are at once correct and clear, and it is rich in exercises.

Palmer and Taylor's "Plane Geometry" (Scott, Foresman; 80 cents), edited by Dr. Myers, is commendable for its subordination of nice logical considerations to teachableness, for its mingling of nicely graded useful applications with an abundance of abstract exercises, and for its perspective, more important and less important matters being presented as such. It is a pleasure to note a similar avoidance of too much logical refinement in the "Plane Geometry" (Holt), by Messrs. Young and Schwartz. Other notable features of this book are the use of two colors in most of the figures, the presence of trigonometric ideas, and the employment of the notion of symmetry in demonstrations. The "School Algebra" (Holt), by Messrs. Rietz, Crathorne, and Taylor, is another illustration of the fact that the rising generation is being well supplied with elementary textbooks by competent scholars. This excellent book, designed to cover the first-year course in the subject, will be followed by a more advanced work by the same authors.

CHEMISTRY.

A revised edition of "First Principles of Chemistry" (Allyn & Bacon), by Brownlee

and others, has just been issued, eight years after the appearance of the first printing. The revision has resulted in the rewording of some paragraphs, more extended treatment of a few topics—those of nomenclature and calculations especially—and the addition of two chapters on chemical equilibrium and on radioactivity. A new feature of this edition is the inclusion of the portraits of twenty distinguished chemists and well-known discoverers, accompanied by brief biographical notices. The bulk of the book has been increased, altogether, by 107 pages, bringing it up to a total of 526 pages, and making it a rather formidable text for the high-school pupil. The general excellence of the first edition was marred by a number of minor errors, most, if not all, of which persist in the revision. For instance: matter is still defined, three times over, simply as anything that occupies space, with no mention of the far more important general property of weight—though this is, of course, the basis of the discussions of the fundamental laws and of the calculations. Proust's law of definite proportions is still attributed to Dalton; the gram-molecular volume of gases is still given as 22.2, instead of 22.4; and the reaction of steam on copper with production of hydrogen is retained in two separate discussions of reversible reactions. That such mistakes as these have escaped the attention of the authors and, presumably, of most of the many teachers who have used this book, seems to indicate a discouraging lack of scientific acumen on the part of a large number of teachers of chemistry in the high school.

"Chemical Calculations" (D. Van Nostrand & Co.; $2 net), by R. Harman Ashley, is a well-made book of 276 pages containing a fairly complete discussion of the chief applications of arithmetic and algebra in chemistry. Its distinguishing feature, and that which accounts for its unusual bulk, is the very large number of problems which are offered for exercise. Of these there are 516, besides many others which are worked out in illustration of the various types of calculation. There are no tables of logarithms, molecular weights, etc., and for most of the necessary data the reader is referred to Van Nostrand's Chemical Annual; the one notable exception being the tabulated information about sulphuric acid which occupies most of the brief Appendix.

"A Practical Elementary Chemistry" (Scribner), by B. W. McFarland, is written in the interests of a system of teaching which the author has practiced in the New Haven High School for about ten years and which "has certainly produced remarkable results." This method "is built entirely upon an exhaustive study of the laboratory work, not as illustrating the statements made in the descriptive text, but as the foundation of the whole subject." The book is divided into four parts: Laboratory Work, containing forty-seven Exercises in which a large number of well-chosen experiments are given; Fundamental Ideas, a brief summary of definitions, laws, and theories considered necessary for pupils who are not going to college; More Advanced Theory, supplying the additional material for college preparation, and Descriptive, about 200 pages of the usual descriptive text found in elementary chemistries. The work begins in the laboratory; with the accompanying recitations "Part II of the book is taken up, and very intense drill is given on the meanings and uses of symbols, formulas, and equations." No lessons are assigned in the descriptive part, this being used only for reference in the preparation of written reports and exercises. In the recitations "the pupil is required to express himself very exactly, and with a speed that assures the teacher at once of the pupil's absolute mastery of the subject." One of the topics on which especial stress is laid is writing equations showing the seven different ways of forming the salts of oxygen acids, and "this drill should be so thorough that the pupil is enabled to complete the seven equations in one and one-half minute." "Modern ideas of efficiency are involved in every point of the course: *i. e.*, how to get the desired results in the shortest time, with the least effort." The frequent recurrence of the word "drill" in the author's Suggestions to Teachers appears to indicate the keynote of his "system." "Remarkable results" in the form of letter-perfect recitations can undoubtedly be obtained by a competent drill-master by this or almost any other method; but whether the pupil gains the scientific point of view, which, after all, is the important thing, will depend in this method more than in others on the attitude of the teacher; the text will give little help in this direction. We cannot agree with the author that "This course puts into the hands of the pupil a book which is almost as good as a private teacher at his side." The book and the method seem reactionary, and recall Professor Barker's textbook published in 1870, in which the theoretical and the descriptive matter were in two separate, water-tight compartments, and the large type of the Theory was to be committed to memory. Some students of chemistry in the seventies will remember the book and the "remarkable results" which were obtained by it.

"Chemistry of Familiar Things" (Lippincott; $1.75 net), by Samuel S. Sadtler, "has been written because of a demand for an insight into chemistry by those whose reading has been directed in other channels." The author feels that chemistry has hitherto appealed to few general readers, but he detects now "signs of an awakening as to the interesting possibility of science considered broadly, and there is no doubt in the mind of the writer that chemistry can furnish interesting subject-matter for general consideration." As a matter of fact, there has always been a wide popular interest in science, and books dealing with scientific subjects in a sufficiently simple manner and an attractive style have never failed to find a large audience. Such a book was Joyce's "Scientific Dialogues," written in 1800, and many readers remember the fascinating volumes of Tyndall "On Sound," "Heat," and "Light," as well as a number of other books which put the layman in touch with interesting facts and speculations in biology, geology, etc. In chemistry we have Liebig's extraordinarily popular "Familiar Letters on Chemistry," which appeared in 1844; Johnston's "Chemistry of Common Life," dating from 1854; "Religion and Chemistry," by Prof. J. P. Cooke (1864), and, to mention only one or two of the more recent publications in this field, Lassar-Cohn's "Chemistry in Daily Life" and Kennedy Duncan's books and magazine articles. This latest contribution to literature of science for the general reader, which begins with an enumeration of substances formed by insects, ranges from the chemistry of the earth's evolution to radium. Air, Water, Metals, Rocks, Soil, Foods, Textiles, and Physiological Chemistry are treated at some length, while Lighting, Heating, Fermentation, Soaps, Leather, Rubber, and Glass are also discussed. A brief outline of elementary chemistry is given in the first chapter "to enable the reader to understand and appreciate the sequel." The book, as is seen from this list of titles, presents a large amount of information, most of which falls well enough under the head of chemistry. The author is a chemist of wide experience, and from this he draws a number of interesting and pertinent observations. Unfortunately, the manner of presentation is not particularly attractive, and many sentences are so badly worded that they are vague or positively misleading. For example: The "elaboration of chemicals *from* the fungi and bacteria, such as alcohol and carbon dioxide *from* yeasts," etc. (The italics are ours.) "On a clear day the hot flue gases are *very much lighter* and the weight of the atmosphere pushing at the grate bars is notably greater than at the top of the chimney." "Expenditure of mechanical forces always results in a definite amount of heat." "For heat to move best in water or air, it must rise and circulate." One is in doubt in a number of instances whether the author really meant to say what he has printed: "It [the atom] is thought by some to be made up of electrical vibrations." "The more enlightened people are, the more heat they need for comfort in countries that have winter." "Because a thing happens it can generally be explained." "It [dew] condenses on grass, leaves, and other objects, because of the greater prevalence of moisture close to the ground." "In winter the heated air of the houses is too dry, *especially in the Northwest*." He certainly did not intend to define celluloid as "a vulcanized fibre made by the action of zinc chloride on paper" (p. 27).

PHYSICS.

Prof. N. C. Riggs has revised and rewritten the well-known textbook "Hancock's Applied Mechanics for Engineers" (Macmillan; $2.40). In this revised edition, the general treatment and arrangement have been retained. The most important changes to be noted are the transfer of the chapter on the dynamics of a rigid body to a later position, the increased use of graphical methods, and the addition of many new problems. The text was a popular one as it left the hands of Professor Hancock, and it has been improved in this edition.

Most of the books by Prof. Harry C. Jones are irritating to the reviewer for the reason that their good qualities are marred by carelessness of thought and style. This carelessness is particularly inexcusable in "Electrical Nature of Matter and Radioactivity," third edition (Van Nostrand; $2 net). A book on such a topic which runs into three editions has, presumably, good qualities, and this popularity should have induced the author to correct misprints, mistakes in grammar, and false statements, and to revise with enough care to bring facts up to date. For example, on page 3 we find *positively* for positively; on pages 188 and 189, *Allan* for Allen; on page 23, "What we know *is changes* in energy"; page 29, "The elements have their own . . . characteristic *spectrum*," and the statement following is not a sentence at all. As errors we may note the following: On page 30: "J. J. Thomson, to whom we owe the entire electron conception"; as a curious piece of rea-

soning, Professor Jones states that Ostwald proved "Matter, then, is a pure hypothesis, and energy is the only reality," and yet the thesis of this book is that electricity is an entity, and, one would suppose, a reality. It is quite evident that Professor Jones does not consider recent work important, since there are only meagre notices of results since 1909, the date of the second edition. Now it is well known that parts of the subject have been almost entirely changed since then. For example, recent work on the positive rays is not mentioned, the discoveries on the Brownian movements are omitted, as is also Professor Millikan's work. The index is still quite inadequate, as a cursory glance shows many omissions. It is a pity that Professor Jones, who has many of the qualities of a good writer, should treat his readers with such lazy disrespect.

BIOLOGY.

A well-grounded complaint is frequently made that in all our schools too many subjects are taught, and that this congestion crowds out from the course very important old-fashioned matters, such as correct spelling, accurate mental arithmetic, sound geography, and the like. The head of the biological department in the DeWitt Clinton High School of New York city, Mr. George W. Hunter, has felt this want, and has endeavored to meet it by preparing a handbook which is made up of practical problems in simple applied science. ("A Civic Biology," by George William Hunter; American Book Co.). Mr. Hunter has availed himself of the coöperation of many of his associates, and has constructed a synthetic manual of very wide range. Naturally, in a treatise made up, as this one is, of a myriad fragments taken from various sources, specialists can find errors. But in judging such a work, one must ask whether, on the whole, it serves its purpose without leading the pupil much astray. The author begins by showing the relations of plants and animals to their surroundings and then takes up in proper sequence their relations to one another, their appropriation of food, their reproduction, their diseases, the preservation of health, and the bearing of all this upon the best means of obtaining civic welfare. A careful perusal of the book shows comparatively few slips, and none of serious importance. The book is made for high-school pupils, but it can be read or seriously studied by all who wish to inform themselves as to the numberless points where modern biology touches civic betterment. It is a far cry from the simple plant-cell and its simple life to the ancestry of Jonathan Edwards and the doctrine of Mendelism, but the long path between them lies in this little book. A few of the illustrations need more explanatory text to make them plain.

ANTHROPOLOGY.

The work done last year by expeditions of the Smithsonian Institution was almost all of the regular collecting type, with, however, a gratifying increase of valuable observation in the field. This is a phase which must soon become of prime importance. Instead of forever adding to the great collections in museums, we need more than anything else careful, thorough observations on the life histories of organisms, on the embryology, the soft colors, and parts which change character in dried or spirit specimens. The most interesting title in the publication is the illustrated account of the exhibits, at the Panama-California Exposition, of the natural history of man. Among many separate exhibits is a series of life-sized direct casts showing human development from the ovum onward of the white American, the Indian, and the negro. These have required two years and a half of constant labor. The later series show fifteen stages, from a day or two after birth to the oldest persons who could be found. Long trips were made when trustworthy news of a centenarian was received. In the case of the earliest, it was necessary in some cases to locate a likely source and then to wait until the infant was born. Restorations of all the remains of primitive man and casts of types of all races of mankind complete this excellent contribution to a subject of the keenest interest to us all.

ZOOLOGY.

For more than fifteen years Prof. Charles M. Child has been engaged in original work connected with some of the most perplexing problems in the life of organisms. He has endeavored to study in the laboratory some matters which hitherto have been largely treated by speculation without experiment. In "Senescence and Rejuvenescence" (University of Chicago Press) he has fairly stated the more important speculations, and he shows the bearing of these upon the question of life in its wide sense. He touches lightly upon the vexed question of vitalism, a discussion which goes back to Aristotle, but which is always coming up in a fresh and unexpected guise, and he discusses the various substitutes for a vital principle which have been suggested. These theories are taken up without prejudice; each receives its proper value and is assigned to its proper place. This prepares the way for a lucid presentation of the Life-Cycle in general, and thus the reader is brought to the major topics of Senescence, growing old, and Rejuvenescence, growing young. Not all readers will feel wholly satisfied with the author's definition of growth or of individuation, but he has done about as well, perhaps, as any one could. Having laid these matters aside, he approaches his laboratory study of susceptibility in one of the lower animals, Planaria, which affords convenient material for experimentation. Here we are brought face to face with the marvel of reconstitution, and the associated matters of certain forms of reproduction. The part which nutrition, or the lack of it, plays in the life of the organism is dealt with experimentally and, on the whole, very satisfactorily. From his experiments, Professor Child concludes that senescence is associated with the productive and progressive phases, and rejuvenescence with the reductive and regressive phases of the life cycle. At first this appears paradoxical, but a careful examination of the reasoning which has led up to the conclusion shows that every step has been taken upon the solid footing of careful experimenting. Although this work is by a zoologist, it is plain that it is investigation by one who also knows plants well. The author is exceedingly modest in referring to his invasion of contiguous fields, but a candid student can see that he is sure of his ground. The volume is enriched by discriminating references to the literature of the subject placed at the end of the sections, and by a very copious index.

In "The Investigation of Mind in Animals" (Putnam; 90 cents), by E. M. Smith, the author makes but little pretence at discussion or abstract theorizing. He limits himself to the presentation of the modes of procedure employed by researchers in animal psychology. Still, there is sufficient comment to reveal the compiler's attitude and to enable the lay reader to compare the general methods and results of the chief workers in this field. In a recent article on evolution Professor Osborn's opening words are as follows: "In the last thirty years two biologies have been developing. The first is the biology of the garden, the seed pan, the incubator, and the breeding-pen. The second is the biology of the field zoölogist, of the field botanist, of the paleontologist." If "experimental cage" had been added to the first of these categories, the work of the present volume would there find its place. The seven chapters deal respectively with Protozoan Behavior, Retentiveness: Habit-Formation, Associative Memory and Sensory Discrimination, Instinct, Homing, Imitation, and The Evidence for Intelligence and for Ideas. A rapid review of the entire book leaves one with a decided feeling of disappointment. There is so little of certainty, after so enormous an amount of experimental research in a field which is of the greatest importance as leading up to an adequate understanding of our own psychology. These short quotations from the first chapter will illustrate the general vagueness to which I have reference: "There is, therefore, no clear proof of the occurrence of any phenomenon requiring for its explanation the presence of consciousness in the Protozoa. Nor is there any evidence to show that these simple creatures are able to profit by experience in any but the most transient manner. . . . Nevertheless, though the available evidence does not support a tropistic interpretation of the behavior of the Protozoa, it is by no means necessary to refuse it a subordinate place as presenting a more or less true account of certain phenomena when regarded in isolation. . . . To sum up, though the activities of unicellular organisms reveal no irrefragable proof of the presence of mind, a study of their conduct suffices to exhibit at least a fundamental resemblance to so-called 'intelligent' behavior." Upon so insecure a foundation one proceeds to the consideration of the psychology of higher animals with no great amount of credulity. The chapter on imitation is the best, and that on homing the least satisfactory. The fact that migration is not touched upon eliminates whatever of value might be found in the latter. This hopeless groping for some definite foothold is finally illustrated by this illuminating paragraph: "Reviewing our evidence, we may say that it is by no means disproved that animals are intelligent and have 'ideas,' but . . . no test as yet applied completely excludes the possibility that animal learning is anything more than a process of association on the preceptuo-motor level. The one point that clearly emerges is the need for new methods of inquiry." After this summary of controlled experiments, our minds turn with relief to Henri Fabre, and with renewed interest to Bergson.

To students of zoölogy, and especially of evolution, one of the most welcome contributions of the year will be "The Alligator and Its Allies" (Putnam; $2.50 net), by Dr. Albert M. Reese. The publishers even express the hope that it has an "assumed appeal for

the layman interested in natural history." But this can hardly be said to be the case, even in the first chapter, which treats of the biology of the alligator. The account is too categorical, too lacking in color and force of presentation, to be far removed from text-book diction. In its intended field it is admirable. Within a volume of convenient size we find the more important known facts concerning the biology, anatomy, and development of the American alligator. The author has made three trips to the Everglades and swamps of Florida in search of these reptiles and their nests. He has brought to bear the skill of an embryologist, and has carefully reviewed the literature of his thesis, and has not hesitated to draw upon this whenever it seemed worthy. The biology rests almost wholly on the author's own observations, and gives an excellent idea of the wild life of these creatures, their breeding habits, and economic value. Thirteen feet is apparently the maximum size, but, instead of being a creature of extremely slow growth, an alligator can attain a length of ten feet in as many years. The maternal care of the female for her offspring is somewhat discounted, although it is thought that she remains near, and when warned by the squeaking of the yet unhatched 'gatorlings, returns and uncovers the eggs, to enable the little fellows to escape from under the heavy weight of the nest débris. So great has been the slaughter of alligators in our Gulf States that thirteen years ago it was estimated that 80 per cent. had been exterminated. At present, although the demand for skins is greater than ever, no legislative action seems to have been taken. The destructive increase of cane rats and muskrats is, perhaps, due to the disappearance of these great reptiles. The detailed descriptions of the skeleton, and of the digestive, urogenital, respiratory, and vascular systems, and of the embryology are all the work of the author. The entire chapter on the musculature and part of that on the nervous system are translated from Bronn's "Thierreich." It was found very difficult to obtain the early stages of embryos, as these were well advanced, even at the moment of deposition of the eggs. Only by shooting laying alligators could these stages be obtained. The most regretted lack is the absence of all comparative comment, the phase of application which would have added so much to this research. An abundance of excellent drawings and photographs and a good bibliography and index give additional value and completeness to the book.

GEOLOGY.

Would that some of the early fathers of the glacial theory—Playfair, Charpentier, Agassiz—could return to us for an inspection of Monograph LIII of the United States Geological Survey, on "The Pleiocene of Indiana and Michigan and the History of the Great Lakes," by Leverett and Taylor, expert specialists both. The volume is a marvel of interpretation, summarizing the work of many years, and showing in great detail the features due to the glacial lobes that occupied the troughs of Lakes Erie, Huron, and Michigan, in so far as they overlapped on the intermediate States above named. The most significant features of the region are of two kinds: terminal moraines, formed during the ice retreat; and shore lines and outlet channels of proglacial lakes. The moraines are arranged in festoons around the retreating ice-lobe margins, in accordance with the principle announced by Chamberlin nearly forty years ago. The proglacial lakes resulted from the gentle northeastward slope of a considerable part of the district, which caused the retreating ice-lobes to obstruct the drainage of the surface that they evacuated. The ingenuity with which the history of the lakes and their changing outlets is deciphered is truly admirable.

"Mountains, their Origin, Growth, and Decay" (Van Nostrand; $4) is the last work of the late Prof. James Geikie of the University of Edinburgh, whose death occurred last year. The volume deals, as the author says, "almost exclusively with the borderland of Geology and Geography"; it might be expected to lean more to the latter than to the former science, as it is dedicated to the Council of the Royal Scottish Geographical Society, but as a matter of fact it is much more taken up with geological problems of structure, deformation, and denudation, than with geographical problems of form and appearance; it thus illustrates once more how difficult it is for a geologist to cross the border which separates his well-matured science from its much less matured neighbor. The book has twelve chapters: for some reason that is not apparent eleven of them are entitled Original or Tectonic Mountains, while only the final chapter has a new heading, Subsequent or Relict Mountains. The first two chapters are concerned with young volcanic cones and dissected volcanic cones; the third with pseudo-mountains such as moraines and sand dunes; the fourth and tenth chapters deal rather lightly with theories of deformation; chapters five to eight are occupied with the Alps; chapter nine with ancient, worn-down mountains of Europe; chapter eleven treats of ocean "deeps" as the converse of mountains; and chapter twelve of relict mountains, or those which are left in relief by the excavation of valleys beneath an even surface of any structure. The distinction here made between original and relict mountains is artificial; insufficient attention is given to the large and growing class of mountains that, partly worn down after their deformation, are then uplifted again and thus enter a new cycle of erosion. Curiously enough, glacial erosion, a highly important process in the sculpture of many lofty ranges, is hardly mentioned. The book contains nearly 80 fine photographic plates, many of which are insufficiently related to the text; 57 figures, a glossary of 15 pages, and a 9-page index.

GEOGRAPHY.

The third Annual Report of the Argentine Geographico-Military Institute, for 1914, indicates progress in several lines of work, from measurement of baselines and geodetic triangulation to the publication of completed map sheets. The far southern republic thus promises to contribute to the international map of the world on the scale of 1:1,000,000, on the plan of Penck of Berlin, as well as to furnish its own people with detailed maps of their country on scales of 1:100,000 and 1:25,000. A significant feature of the present report is a translation of a monograph by Haardt von Hartenthurn, of Vienna, on the organization of the topographical bureaus of the European countries.

An interesting and instructive work in Sir Charles Lucas's well-known series covering the historical geography of the British Dominions is the second part of Volume IV, entitled "Historical Geography of South Africa" (Oxford University Press), which embraces the period from 1895 to the outbreak of the present European war. An account of the political and social conditions of the South African Republic in 1895 is contained in the first chapter, in which the author shows that, at the end of that year, the situation was such that "revolution was in the course of nature." Then follows a discussion of the Jameson Raid and of events leading up to the outbreak of the South African War. The latter receives a detailed and illuminating discussion in three chapters, occupying three hundred pages of the slightly less than five hundred pages of text proper. The last two chapters are devoted respectively to reconstruction and union, and a general summary. The text is interspersed with a considerable number of maps and drawings which lend an added interest for the reader, and there is, at the end of the volume, a bibliography, including the books and other publications relating to South Africa. The appendix contains the texts of the Pretoria and London Conventions of 1881 and 1884, the Middelburg Terms offered by Lord Kitchener to Gen. Botha of March, 1902, and the Terms of the Vereeniging Treaty of May 31, 1902. A table of the dates of the principal events in the later history of South Africa serves as a convenient guide to the student or general reader, both of whose interests seem to have been kept well in mind by the author.

A small book of 180 pages on "Studies in Carto-Bibliography," by Sir H. G. Fordham (Oxford University Press), contains a number of essays, reprinted from the transactions of various societies, and revised, as originally written, with enthusiasm in the fulness of knowledge, concerning early road-books, county maps, and atlases of Great Britain and France. It can appeal but little to the great body of readers, but it is a choice morsel for the antiquarian whose tastes lead him along highways and byways. Among its chapters are Index List of the Maps of Hertfordshire, 1579-1900, John Cary, Engraver, Mapseller, and Globe-maker, The Cartography of the Provinces of France, 1570-1757, Descriptive List of the Maps of the Great Level of the Fens, 1604-1900, and Specimens of Full and Abridged Descriptions of Maps of Various Dates. High praise is given to the printed catalogue of atlases issued by our Library of Congress. The book closes with a five-page bibliography and a six-page index.

BOTANY.

One of the laboratory handbooks which were introduced in 1901 has now, in its third revision, brought its subjects again quite up to date. "Methods in Plant Histology" (University of Chicago Press; $2.25 net), by Charles J. Chamberlain, may be fairly said to have kept abreast of the times from the first. It is clear in its directions, and is sufficiently full to enable even the student who works by himself to become acquainted with the finer points in modern histological technique. Part one is devoted to a description of apparatus and other appliances, and to the approved methods of cutting and staining; part two gives, with sufficient details, directions for attacking special problems in the structure of the lower and the higher plants.

In 1838, J. C. London published an illustrated work on the trees and shrubs of the British

Isles, which contained, in addition to its accurate descriptions, a large number of classical citations and much interesting folk-lore. Loudon's "Arboretum et Fruticetum Britannicum" had four volumes of text and four of admirable plates. Many of the plates gave the winter-state of the plants, thus enabling the landscape architect and the amateur planter to know how the elements at their command would look when they were stripped of their foliage. In short, the volumes were a treasure in city as well as in country houses, and they have maintained their popularity even down to the present day. But it is plain that such a treatise must require frequent revision to keep it abreast of the times. In place of such revisions there have been many attempts to construct treatises covering a part or a whole of the same ground. One of the latest is "Trees and Shrubs Hardy in the British Isles," by W. J. Bean, assistant curator Royal Botanic Gardens, Kew, two volumes (Dutton; $15). The descriptions are arranged conveniently, the genera in alphabetical order, and likewise the species, placed under each genus. One hundred pages are devoted to plain directions concerning the care of woody plants and their selection for special localities. All of the advice is safe and sound, and may be unhesitatingly followed for our Eastern and Northern States. The volumes make a capital supplement to the older work of Loudon, bringing the specific descriptions down to the latest possible moment; they also contain a good account of the recent acquisitions from China. The plants newly introduced by Mr. Ernest Henry Wilson are described as far as has been possible, which fact gives to the work a high value for arboriculturists. It should be noted that the treatise is very conservative, but it is none the worse for that.

HORTICULTURE AND FARMING.

In "Continuous Bloom in America" (Scribner; $2 net) Louise Shelton tells us where to sow annuals and perennials, how to lay out artistic beds with harmonious and symmetrical patterns, and furnishes cultural directions for a garden of continuous blooms from early spring to late autumn. Not the least important part of the book is the planting charts, by which one may visualize the effects sought after. These charts are facsimiles of successful plantings, but in attempting to follow the plans, says the author, "successful results will be at last obtained only when the gardener has learned the knack of crowding without detriment to the plants." The author also has advice for those who would specialize in spring and autumn displays. Her suggestions are practical, and she avoids technical language. There are numerous illustrations of famous American gardens.

Those of us whose school days date too far back to include the joys of "school gardens" and agricultural studies can recall our favorite "motion song" in the primary grade. It ran like this:

> Shall I show you how the farmer
> Shall I show you how the farmer
> Shall I show you how the farmer
> Sows his barley and wheat?

With the response:

> O 'tis so, so, that the farmer
> O 'tis so, so, that the farmer
> O 'tis so, so, that the farmer
> Sows his barley and wheat.

As the books "for students who desire a practical working knowledge of the essentials of agriculture" pile up on the reviewer's desk, it seems to him as if all the agricultural college faculties were in line with "Shall I show you how the farmer?" The "so, so" of the farmer's activities is simply and completely set forth in Prof. Henry Jackson Waters's "Essentials of Agriculture" (Ginn; $1.25 net). Beginning with a general chapter on The New Agriculture, the book proceeds to tell in detail how soil should be managed, its properties utilized, its fertility maintained, and how upon soils thus understood and handled profitable crops may be grown and improved stock raised. Particular information as to the various sorts of crops—small grains, fibre crops, grasses, legumes, forage crops, roots and tubers, sugar and tobacco, fruit—is given briefly but so definitely as to be of real value. Of course, the numerous pests of garden and orchard and the sprays that control them receive their share of attention. There are also two closing chapters of value on Business Aspects of Farming and Mechanical Power for the Farm. The appendix includes, besides several score cards, a practical spray schedule and table of common farm needs. Altogether, this is a plain, practical handbook, containing a remarkable amount of interesting and valuable farm lore.

NEUROLOGY.

In "Old Nerves for New" (Little, Brown), Mr. Arthur A. Carey deals with a subject of vital importance to most Americans, namely, the effect of the mental attitude upon the nervous system, and the relation of the mind to the body. He shows a method by which, with proper application, self-control can be achieved, beginning with simple physical movements for the relaxation of contracted nerves and muscles. With the power to relax, he asserts, comes the power to direct the physical and mental forces into channels leading to broader, more efficient, and happier living. He treats particularly of the effect of the emotions upon the health, gives suggestions for self-criticism, self-understanding, and self-correction, and advises how to help others to attain self-control. His discussions are at times lengthy; they deal with such vital topics as love, hate, fear, selfishness, pride, and other emotions which strike to the roots of human nature. It is to be regretted that throughout the volume his sound reasoning and sometimes his scientific work are weakened by innumerable Scriptural allusions and quotations, for surely right thinking, right living, and freedom from what Christian Scientists call "error," and psychologists term self-hypnosis, should not be limited to Christians and Caucasians, but should belong to all humanity. But one must have all respect for the author's ardent desire to aid nervous sufferers and for the profound religious spirit of the work. The influence upon the author of the teachings of Annie Payson Call, to whom the book is dedicated, is manifest throughout. Could each of us but follow the suggestions Mr. Carey sets forth, and exchange the worn and dulled old nerves for bright new ones, the physical millennium would be near at hand.

LIP-READING.

Though lip-reading has been taught to deaf children for many years past, there have been comparatively few adults who have attempted to learn it, perhaps because of the scarcity of teachers and the scant literature in the subject. It is with much satisfaction therefore that we call attention to a thorough and comprehensive volume by Martha E. Bruhn—"The Müller-Walle Method of Lip-Reading" (Lynn, Mass.: Thomas P. Nichols & Son; $2). Miss Bruhn studied in Hamburg, under the man whose methods she has adapted to English. In the first chapter on the origin of instruction in lip-reading, she says that for those who lose their hearing after learning to speak, the external characteristics of speech are the essential points. In natural conversation, when lip movements are not exaggerated, the adult deaf person is able to grasp the meaning of a sentence as a whole without a slow pronunciation of each word. With the idea of making the acquisition of the ability to read lips as easy and quick as possible, thirty lessons are arranged, in each of which Miss Bruhn introduces some new sound or combination of sounds, makes suggestions for self-help by practice with a mirror, and furnishes a short story to be read to the deaf pupil. These phrases give the story in a series of questions and answers, and introduce a variety of synonymous terms and colloquialisms in common use. The spirit of the book is admirable, and in its analysis of the points to be noted by deaf persons who desire to read the lips it is invaluable. It shows that lip-reading is an art to be acquired only by most patient perseverance, but that it may be achieved by all who practice diligently, according to the method described.

BUSINESS MANAGEMENT.

Prof. Hugo Münsterberg's "Business Psychology" (La Salle Extension University) opens with a lengthy sermon to the business man on the importance of consulting the expert psychologist, and closes with a reproduction of the not very striking discoveries recorded in his "Psychology and Business Efficiency." The rest of the book is filled with psychological commonplace, illustrated by reference to "the customer" and "the workman," where any other human being would serve as well, and with the commonplace of business experience. Surely no special training in psychology is needed to discover that (*e. g.*) a blue gown is set off by a yellow background, that the merchant must make himself as well as his goods pleasing to his customer, or that it is unwise to distract the attention of a customer who is about to decide in favor of certain goods. Altogether, the shrewd reader is likely to find the special illumination afforded by "business psychology" in strange contrast to its sacerdotal pretensions, and to conclude that, in practical matters, psychology has little to say that might not be discovered by unspecialized intelligence. Professor Münsterberg points to the difference between the farmer's forecast of the weather and the scientific predictions of the weather reports. But the fact remains that the psychologist is (at least) as little able to forecast the commercial weather as any business man; and when it comes to deciding how a given individual will respond to a given offer, the psychologist can say as little as any one else. Professor Münsterberg's observations of the conditions of efficiency are often interesting, but they imply no special apparatus of thought.

Among the recent additions to a growing literature is "Advertising—Its Principles and Practice" (New York: The Ronald Press; $4). The book is the work of four collaborators, Harry Tipper, Harry L. Hollingworth, George Burton Hotchkiss, and Frank Alvah Parsons. It is an indication of the completeness with which the subject is treated that of these four authors two are professional advertising men, one is a professor of psychology, and one the president of an art school. There can scarcely be an aspect of this vigorous business—or profession—which is not presented and analyzed in a manner not only satisfying to the expert, but most engaging to the ordinary reader. One encounters old friends among the many illustrations, which show the advertisements exactly as they are—with no names omitted as in some books in this field. And it is interesting to see the displays of the mightiest advertisers severely criticised, their errors plainly set before our eyes. Some of the pictures are excellent reproductions in color. One might look for a lack of unity where so many minds have joined in the task, but no such fault is to be found.

BIBLIOGRAPHY.

Although Axel Moth's "Technical Terms Used in Bibliographies and by the Book and Printing Trades" (Boston Book Company; $2.25 net) possesses a value all its own, the purchaser should understand that the volume, one of the Useful Reference series, forms a supplement to F. K. Walter's "Abbreviations and Technical Terms Used in Book Catalogues and Bibliographies" (Boston, 1912). The compiler states in a brief prefatory note that the present publication is part of a more extensive work, as yet unpublished. With few exceptions, we are informed, terms which have already found a place in Mr. Walter's work have not been included. Mr. Moth has given us an excellent list of technical terms; those in English have the Danish, Dutch, French, German, Italian, Spanish, and Swedish equivalents. The foreign terms are accompanied by English definitions. Those in Latin have been gathered by Mr. Walter, and they supplement the list appearing in his "Abbreviations and Technical Terms." Judged as a continuation of Mr. Walter's book—and it pretends to be nothing more—Mr. Moth's compilation is admirable. Not only will it be of service to the expert bibliographer and to those engaged in the printing trades, but it will likewise be a distinct aid to the collector of books in assisting him to solve the mysteries of catalogues and other publications printed in languages with which he is wholly or in a large measure unfamiliar.

The Nation

NEW YORK, THURSDAY, SEPTEMBER 16, 1915.

Summary of the News

The delicate relations of the United States and Germany have been somewhat overshadowed during the past week by the adventures of the Austro-Hungarian Ambassador, Dr. Constantin Dumba, whose recall was asked by the American Government on September 9. On that day the Government at Vienna was informed through Ambassador Penfield of the President's decision in a note, which in part reads as follows: "By reason of the admitted purpose and intent of Mr. Dumba to conspire to cripple legitimate industries of the people of the United States and to interrupt their legitimate trade, and by reason of the flagrant violation of diplomatic propriety in employing an American citizen protected by an American passport as a secret bearer of official dispatches through the lines of the enemy of Austria-Hungary, the President directs me to inform your Excellency that Mr. Dumba is no longer acceptable to the Government of the United States as the Ambassador of his Imperial Majesty at Washington."

This issue was precipitated by the detection by English authorities of a letter to his Government written by Dr. Dumba and entrusted to the care of James F. Archibald, who was travelling under the protection of an American passport. In this letter Dr. Dumba stated: "I am under the impression that we could, if not entirely prevent the production of war material in Bethlehem and in the Middle West, at any rate strongly disorganize it and hold it up for months, which, according to the statement of the German Military Attaché, is of great importance, and which amply outweighs the relatively small sacrifice of money." Mr. Archibald, meanwhile, has been forced to return to this country, and will, it is understood, be arrested by Federal authorities when he reaches New York. To what extent the Military Attaché to the German Embassy, Capt. von Papen, is involved in this plot to interrupt the American production of munitions of war is not generally known, but his sudden departure for the Yellowstone is taken to mean that his usefulness at Washington is at an end.

Germany's explanation of the sinking of the White Star liner Arabic on August 19 was received at the State Department on September 9, having been delivered to Ambassador Gerard on the evening of the 7th. This memorandum, contrary to affidavits of the ship's passengers, asserts that the Arabic altered her course in such a way as to lead the commander of the submarine to believe that his craft was about to be rammed, and that in self-defence he was forced to fire a torpedo. A significant statement follows the expression of regret that American citizens should have lost their lives, viz.: "The German Government is unable, however, to acknowledge any obligation to grant indemnity in the matter, even if the commander should have been mistaken as to the aggressive intentions of the Arabic." In case a harmonious opinion cannot be reached by the two Governments, it is suggested that the differences be submitted to the Hague Tribunal for arbitration, with the provision, however, that "the arbitral decision shall not be admitted to have the importance of a general decision on the permissibility or the converse under international law of German submarine warfare."

The terms of this memorandum leave the possibility of a settlement of German-American differences further from realization than one would have suspected from the positive assurances given by Count von Bernstorff a fortnight ago. Then it was predicted that Germany would accede to the general principle concerning submarine warfare for which President Wilson has all along been contending. As we write, the discouraging outlook has been somewhat brightened by a conversation between the German Ambassador and Secretary Lansing on Monday.

On September 9 sentence was passed on Gustave Stahl, who pleaded guilty to perjury in having made an affidavit that he saw four guns mounted on the Lusitania. Stahl was sentenced to serve a term of eighteen months in the penitentiary at Atlanta.

After repeated unsuccessful attempts, German Zeppelins reached London the middle of last week, killing in that city and in the English east coast counties 33 persons and injuring 129 in raids of two successive nights.

The German submarines, since our last record, have sunk four British, one Russian, and three French steamships, besides a British trawler.

In view of his skilful retreat before the German invasion, the news of the Grand Duke Nicholas's transfer to the command of the Russian campaign in the Caucasus has come as a great surprise to the Allies, as well as to Berlin and Vienna. Coincident with this extraordinary change, the Russians took the occasion for making a stubborn stand that was partly a vigorous offensive at Tarnopol September 8, in which it was asserted that 200 officers, 8,000 men, and 30 field guns were captured. This victory was later denied from Berlin. Again at Trembowla a Petrograd dispatch claims a victory over Austro-Hungarian forces, which, in conjunction with the previous victory at Tarnopol, is said to have netted more than 15,000 prisoners.

The full details for the reasons underlying the transfer of that able commander, the Grand Duke, are still to learn. While paying a chary tribute to his acknowledged prowess, Berlin papers have assumed that the change was necessary and inevitable in the light of the steady retreat before the victorious Teutonic armies. London, on the other hand, pays an unstinted eulogy, and emphasizes the new significance that the hitherto desultory fighting in the Caucasus has assumed since the Allies have begun to make their offensive felt at Constantinople.

The only news of definite importance from the western front has concerned the renewal of desperate fighting in the Argonne and the apparently costly attempt of the Crown Prince's army in its endeavor to force the Verdun barrier. Two divisions of Germans attacked the French lines near Fontaine-aux-Charmes on the night of September 8. By the aid of asphyxiating gas, they gained a section of the French lines from 300 to 500 yards in extent. The magnitude of this gain has been denied by the French War Office. Paris maintains that the greater part of the lost ground has been recovered. French official figures assert heavy losses for the Germans on this occasion, and estimate that the Crown Prince's army in the several attempts has lost upwards of 100,000, one corps alone losing 40,000 men from the ranks. Since the failure of the first drive the French profess to have rendered Verdun, the Crown Prince's objective, well nigh impregnable.

The situation in the Balkans remains much what it was when we last wrote. Bulgaria is apparently still negotiating with both parties to the war, and has meantime reached an agreement with Turkey by which it receives the rights of the Dedeaghatch Railway and a strip of territory two kilometres broad along the left bank of the Maritza. The bid of Servia for Bulgarian support has not been accepted, and Greece is likewise unable to meet Bulgaria's demands in Macedonia.

On September 10 the State Department received the long-awaited reply of Gen. Venustiano Carranza to the invitation, proffered on August 15 by the United States and diplomatic representatives of the Latin-American States, to confer with the leaders of various factions in Mexico in an effort to bring about peace. While declining the tender of mediation on the part of any foreign Government, Gen. Carranza takes it upon himself, as the leader of the Constitutionalist army, to invite the American representatives to a conference with him, to be held in one of the frontier towns on the Rio Grande, and suggests that, if these representatives consider that he is maintaining a *de facto* government in the republic, they recommend its recognition by their respective countries. It seems not unlikely that Gen. Carranza's invitation to meet with him in conference will be accepted.

Secretary Daniels announced on September 12 the personnel of the Naval Advisory Board of Inventions, the committee of experts who will recommend improvements for the navy. Besides the chairman, Thomas A. Edison, the Board includes the following: W. R. Whitney, L. H. Baekeland, Frank Julian Sprague, Benjamin G. Lamme, R. S. Woodward, Arthur Gordon Webster, A. M. Hunt, Alfred Craven, Spencer Miller, William Le Roy Emmett, Matthew B. Sellers, Hudson Maxim, Peter Cooper Hewitt, Thomas Robbins, Howard E. Coffin, Andrew J. Riker, Henry A. Wise Wood, Elmer A. Sperry, William L. Saunders, Benjamin B. Thayer, J. W. Richards, and Lawrence Addicks.

The proposed new Constitution for New York State was adopted by the Constitutional Convention, in session at Albany, on September 10, by a vote of 118 to 33, Tammany voting solidly against it.

The Week

The text of the German note on the sinking of the Arabic is, in the main, substantially what had been indicated in the newspaper dispatches. The bearing of its explanation and defence of the act upon the situation opened by the sinking of the Lusitania, and apparently closed by Count Bernstorff's note to Secretary Lansing on September 1, are discussed in other columns. There is, however, one passage in the note handed to Ambassador Gerard by the German Foreign Office which is of the gravest importance, and which had not been forecast in the unofficial dispatches. We refer to this remarkable and unambiguous announcement:

> The German Government is unable, however, to acknowledge any obligation to grant indemnity in the matter, even if the commander should have been mistaken as to the aggressive intentions of the Arabic.

This evidently offers matter for the most careful and anxious consideration by Secretary Lansing and President Wilson. Does it mean that the German Government regards the assertion of any of its naval officers on every question of this kind as the last word in the matter? Does it mean that neither the judgment nor the veracity nor the *bona fides* of any such officer is ever to be open to question? If this is what it means, what is the value in practice of an assurance of safety by the German Government, however complete it might be in theory? If this is not what it means, what precisely does it mean? These are questions which cannot be ignored, if we are to know where we stand in the whole matter.

The most interesting sequel to the Dumba affair is the denunciation of his activities by the "white slaves" for whom he felt so much sympathy—after they engaged in the manufacture of munitions. It must be a shock to the Ambassador to find the Slavonic Club of South Boston resolving that "as long as the pay and conditions are in keeping with the work performed, no appeal will be listened to by Czechs and Slovaks on the ground of loyalty to the Hapsburgs"; to find the Slavonic Political Federation of New York emphatically proclaiming that they will always oppose "the anti-American and anti-Allies propaganda in this country," inasmuch as 1,000,000 of their people were driven from Austria-Hungary by political and economic abuses. As for the Middle West, the Bohemian National Alliance, the Croatian League, and the Slovak Guards have in mass meeting in Chicago contradicted his insulting references to their ignorance, and declared their intention to stand their ground. Such declarations put it beyond a doubt that any permanent or temporary stoppage of the output of munitions by a mere open appeal to these races was impossible, and that no one acquainted with them could think it anything else. Dr. Dumba pretends that he was actuated by a humanitarian motive; the Austro-Hungarians remind him that they come by shiploads to improve their condition, that they are able to take care of themselves, and that his interest is suspiciously sudden. When Dr. Dumba appeals to their patriotism, they reply with declarations of indifference or of sympathy for the Allies.

"One fact is lacking," says the New York *World* editorially, "in the amazing story the *World* told Monday of an attempt, at a cost of more than $1,000,000, to tie up shipments of freight from the United States. In all else the account of the strike that failed is complete. The missing fact is the name of the paymaster." We are by no means desirous of belittling the importance of the *World's* exposure; but it is evident that the assessment of its importance must turn on that "missing fact." That a nefarious plot in the interest of Germany and Austria was being hatched; that the plot was one which, if executed, would have meant most serious trouble and injury to this country; that to several persons connected with labor organizations, including the president of the International 'Longshoremen's Union, belongs the credit of faithful and effective work in frustration and exposure of the scheme—all this seems fully proved by the *World's* documentary evidence. But whether any person in the service of the German or the Austro-Hungarian Government was at the bottom of the attempted conspiracy is wholly open to doubt. So long as no evidence on this point is adduced, it is entirely possible that the scheme was hatched in the mind of some unauthorized pro-German plotter, without any official aid or connivance. What our own Government's Secret Service may have discovered in regard to it, we are unable to say or to conjecture. In view, however, of the recent revelations concerning Dr. Dumba, it would be fully as rash to assume the absence of Teutonic official connivance with the plot as to assert that it must have had official backing.

If President Wilson is harassed by diplomatic difficulties, created by the war, his burdens must be increased rather than diminished by the appeals, public and private, that are poured upon him to do something to stop the conflict. The most popular way of making these appeals just now is apparently through the Pope, who is reported as being deluged with requests from both neutral and belligerent countries to intercede with Wilson to hasten action leading to the opening of negotiations for peace. It is easy to understand the impulse behind these appeals, even if one dismisses the hypothesis that at present they are secretly encouraged by persons of influence who would like to see Germany realize upon her Russian successes. But, harsh as it may sound, they do credit to the appealers' hearts rather than to their heads. Everybody who has been favored with an expression upon the subject from Wilson is keenly aware that the individual who most desires to exert the full weight of his force, personal and official, in the direction of a cessation of hostilities is the President of the United States. He is known to regard such action as the greatest opportunity that could possibly come to him. But he is conscious, as too many of his petitioners are not, that nothing is to be gained, but much to be lost, by a precipitate move, and especially by repeated moves that come to naught. Such measures would only cheapen the whole idea of mediation and render it more difficult of application when the right moment arrived.

Lloyd George's preface to the forthcoming volume of his speeches on the war lacks nothing in that grim frankness that is now characteristic of the utterances of English leaders on the crisis they are facing. Nor, so far as one can judge from this distance, is there any of that disposition to cry "pessimist" that was evident when Kitchener, so early in the contest, made his famous remark about a three years' war. The new element in Lloyd George's pronouncement is his open recognition that Great Britain must play the leading part on the side of the Allies, not merely because she is richer and more efficient than her associates, but because, as things stand after twelve months of struggle, she is the only one possessed of large reserves of men and material that are capable of being rapidly drawn upon. Russia, says Lloyd George plainly, has suffered a shock that "for the time being" has ended "her contribution to the struggle for European freedom," while France is already bearing about all that can be expected of

her. In this writing of Russia off the books for a while, there may be a little of that rhetorical exaggeration which depicted indifference in English breasts at the very moment that recruiting was becoming satisfactory. Yet the net effect of Lloyd George's estimate of the situation is only to express as a *fait accompli* what everybody foresaw from the very beginning—that the ultimate phase of a prolonged contest would be a duel between Germany and Great Britain. Russia sufficiently demonstrated the weakness of Austria months ago. Now as clear-headed and resolute a man as England has confesses that on her side, too, there is one antagonist that must be prepared in mind and body to bear the brunt of an unprecedented burden.

We are glad to call attention to a communication in our correspondence columns, entitled "A Word to the Moderately Rich," both because of the spirit which prompted it and because of the situation which it accurately depicts. That the author of this letter, though a professional man and hence presumably not in a position to amass a large fortune, has been stirred to a deep sense of responsibility by the desperate plight of the sufferers from the European war, is an example which should open the eyes of many to the fact that Americans of means, in spite of the help they have given, have not as a rule imposed any real sacrifice upon themselves. We have before reminded our readers that the present emergency is one which calls for an expression of the utmost humanity on the part of us all, and that many could add enormously to their customary charities without embarrassment. By means of the various organized funds giving is made easy for those who, though charitably inclined, might otherwise excuse themselves on the ground of the trouble to which they would be put. It is a shocking thought that, with the continuance of the war, not only are Americans not giving aid to the downtrodden in anything like the measure of which they are capable, but are settling back into a humdrum existence, their emotions surfeited by all the calamities of which they have read. It is because of this unfortunate state that we welcome most heartily such a symptom of the contrary as the letter which we print to-day, and trust that it may meet with a generous response from our readers.

Carranza's reply to the invitation that he join in a conference with representatives of the United States and certain of the Latin-American countries to consider the question of restoring peace in Mexico is an invitation that they join in a conference with him to consider the question of recognizing him as the *de facto* head of the Mexican Government. This rejection of the proposal worked out at Washington is in perfect tone; there is nothing of the arrogant military victor about it. On the contrary, Carranza—through his "Secretary in charge of Foreign Relations"—is careful to express his conviction of the "sincerity and the noble desires of the Governments" behind the "courteous invitation." His rejection of that invitation he puts upon two grounds: the undesirability of foreign intervention in a country's internal affairs, and his command of the situation by means of an army controlling "the greater part of the national domain." The first of these points, however strong in theory, must, in the present instance, depend for its force upon the validity of the second. Here Carranza is undoubtedly in a much more tenable position than he was when the invitation to him was framed. He stands at last, if appearances are to be trusted, the only powerful chieftain in his distracted country. This must be a leading consideration at the next meeting of the Ambassadors who offered the invitation and who have now to decide upon what action they will take in view of the acceptance of their advances by the minor leaders and the rejection of them by the most important one.

Attorney-General Gregory's opinion that a large proportion of foreign ships and all foreign-built vessels admitted to American registry are exempt from the life-saving regulations laid down by the Seamen's act will be a sad blow to La Follette and Furuseth. Indeed, Solicitor Thurston holds that the opinion will exempt from the regulations the vessels of virtually all the great maritime nations. The ruling applies to the ships of those lands whose navigation laws "approximate" our own, and there are few important countries in which they do not. To the complaint of our shipping interests upon the burdensomeness of the life-saving provisions the authors of the act have always replied that they would apply equally to all foreign vessels touching our ports, and that competitive conditions would thus be untouched. Now there will be significant inequalities in equipment requirements, and the tendency of our vessels to use foreign flags will be increased. It is true that the decision in no way affects the act's sections regarding wages, hours, quarters, and the punishment of sailors in foreign countries, and from La Follette's point of view it is well that they are left intact. But they are the very sections which are certain, in their application to all ships, to involve us in treaty difficulties with other nations.

The passage in Porto Rico of a new homestead law, opening 150,000 acres of old Spanish crown lands to the people, is a step made imperative by the rapid growth of the island in population. The first American census, that of 1900, showed 950,000; a counting just completed shows 1,250,000, which is an increase of 130,000 since 1910 alone. The little possession now has 350 people to the square mile, or slightly more than New Jersey; and the emigration is negligible. Generous homestead laws are the more needed in that there have never been many small freeholders, most of the tracts having been held and cultivated in units of great acreage. The Government has steadily attempted to wipe out peonage, or any analogous condition, and it is to be wished that it could supplement rural credit measures with the offer of larger areas of homestead land than are available. The growing density of population in Porto Rico suggests that only the development of manufacturing can avert or soften many acute social problems. A full supply of labor is itself an incentive to the placing of capital in industrial enterprises, but insular witnesses at one of the sessions of the Federal Commission on Industrial Relations proposed that the Government try more actively to encourage investments.

Pass the Jones bill, hinted ex-President Taft at San Francisco last week, and the Philippines will in no time be reduced to the state of Mexico; Governor-General Harrison has already carried them far towards ruin. In the face of such dark predictions, it is sufficient to ask for specific examples of ruination, and to recall how mild the provisions of the Jones measure actually are. Mr. Taft spoke of a "present pernicious lack of self-restraint and sacrifice of public weal to political pelf." Does this refer to such acts as the recent mass meeting of Cebu people to protest against the return of Dean C. Worcester as the head of the Visayan Refining Company? The Filipinos' dislike of opponents of their desire for greater self-government is too natural to convict them of political incapacity. This much abused Jones bill is but a logical sequel to the Administration's action of

1913 in giving the Filipinos a majority in both houses of the insular Assembly. It confers upon the Assembly full powers of legislation except as regards tariff, currency, and public lands, but still vests in the American Congress an absolute veto. The suffrage is also cautiously enlarged. Mr. Taft states that it will be two generations before the Filipinos are fully able to govern themselves. Opinions differ on this; but the Jones bill, as passed by the House last session, set no definite date for surrendering the islands.

The new Constitution of New York State goes before the people by a vote that commends it to their favorable consideration. Not only was it adopted in its final form on Friday by a vote of more than three-fourths of the delegates; the bulk of the opposition vote was due to Tammany's objection to a single provision, that relating to apportionment. The alignment of forces is thus the opposite from that which the agitators for a Convention confidently expected when they invited the people of the State to vote upon the question of holding one. Then the Democratic organization counted upon plumping enough votes to insure the returning of an affirmative answer, and hoped to elect a majority of the delegates to the Convention so ordered. In the first part of this plan, it was completely successful. Had it not been for the military-like response of the Tammany cohorts, the Convention proposal would have been defeated. As it was, the proposal was carried by the small majority of 3,000 in a total vote of 300,000. But in the second half of its programme, the Democratic organization failed. The Republicans elected a large majority of the delegates. Yet the division in the Convention has not been a division between Republicans and Democrats. Once more the Empire State has been treated to the spectacle of the notorious bi-partisan alliance, this time shamelessly out in the open. Its last appearance was somewhat ludicrous, Barnes joining on Friday with the twenty-eight Democrats who could not accept the apportionment article, and then finally changing his vote to the affirmative side.

Mistress in her own house, Canada is giving a lesson in housekeeping to her mother. Since the beginning of the war, according to announcement made by the Labor Department, there has been a complete cessation of strikes in the Dominion. The prolonged strike of the Vancouver coal miners was formally called off ten days after hostilities began, and even chronic centres of discontent have been calm. In large measure this has been due to the appeal of the Government to employers and workers to make extraordinary efforts to adjust peaceably any difficulties. In part, it is to be ascribed to the prosperity the country has found in war-orders and in the relief recruiting brought to an overcrowded labor market. With steady and profitable production in many lines following a long period of depression, the country has been in no mood to sacrifice its gains wantonly. But it is a significant part of the manifestation of a new spirit in Canada, roused by the war to a long-needed stock-taking and heart-searching in both economic and political matters. The quarrels of party have been hushed in their incipiency; the early scandals in the production of munitions caused an extraordinary outburst of indignation; such grafting as that which led last week to the indictment of the late Roblin Ministry in Manitoba faces a sterner public opinion; and it is natural that sentiment should be hostile to those responsible for labor troubles.

That extraordinary success in the largest affairs of practical enterprise is not incompatible with the keenest interest in a wide range of subjects having nothing to do with these was strikingly attested in the case of Sir William Van Horne, whose death removes the most striking figure in the business world of Canada. His personality was as interesting as his work, and there was a certain mark of genius in the amateur activities of various kinds in which he employed his leisure. It is a rather notable coincidence that, while the United States furnished Van Horne to Canada, Canada gave to the United States the man whose career and personality most suggest that of the chief maker of the Canadian Pacific Railway. There is a difference in that J. J. Hill came to Minnesota while a mere youth, and "grew up with the country," while Van Horne was forty, and had been president of a railway company, before he transferred his energies to the Canadian field. In another respect, however, the analogy is complete. Van Horne became as thoroughly devoted to Canada as Hill to the United States; and both men have been conspicuous in the general life of the respective countries.

The intemperate expression of international animosities by some European scholars has excited so much comment that it is pleasant to note as a foil the continuance of various friendly studies in international fields. The only two periodicals devoted exclusively to research work in the English language and literature—the *Anglia* and the *Englische Studien*—are to be maintained by their German sponsors, and are to continue publishing articles by Englishmen, Germans, and Americans. The Hungarian *Shakespeare-Jahrbuch* appeared last February without reference to the war, and the German *Shakespeare Jahrbuch* is also to be published. News comes from Berlin that the Berlin Academy is now engaged in bringing out an authorized dictionary of Old French, while Prof. Karl Vollmöller's periodical devoted to Romance philology will suffer no interruption. As for England, the Presidential address delivered by Prof. W. P. Ker before the London Philological Society last May dealt with Jacob Grimm, the founder of German philology, in the most generous manner. Professor Ker emphasized the fact that Grimm was, first and foremost, a human figure deserving affection and veneration; and he did full justice to his fundamental contributions to the scientific studies which he treated so broadly. In the field of the humanities, and among men schooled to the highest culture, there is no excuse for any other spirit than this.

The Germans, in reaching the railway from Vilna to Petrograd through Dvinsk, have broken a Russian line of communications which was of infinitely more importance six weeks ago than it is to-day. For this Petrograd-Vilna railway, prolonged to the southwest, becomes the Petrograd-Warsaw road which figured so prominently in the pre-Warsaw dispatches. Had this line been broken before the fall of the Polish capital on August 5, the German total of prisoners would have unquestionably been much greater than it has been. Since Warsaw the Germans have been cracking off piece after piece of the railway line, moving towards Petrograd—at first up to Bielostok, and then up to Grodno. Now it seems probable that the section up to Dvinsk (Dünaburg) will go, and with it the great city of Vilna, the ancient capital of Lithuania. Against Vilna there will now be an encircling movement from south and north, and the evacuation spoken of for more than a month should soon be a fact. Dvinsk, on the other hand, should hold out for some time, since it can still draw reinforcements from the north.

THE LUSITANIA AND THE ARABIC

The difficulty between this country and Germany on the subject of the latter's submarine policy suddenly became an international issue of the utmost gravity on May 7 through the sinking of the Lusitania. With almost equal suddenness the issue appeared to be removed as a possible source of serious trouble on September 1, through Count Bernstorff's note, brought out by the sinking of the Arabic. The burst of satisfaction, of hearty approval and congratulation for President Wilson, and of recognition for what Count Bernstorff and the Imperial Government appeared to have done, gave ample evidence of the good will of the American people and their readiness to accept at its best interpretation the brief assurance contained in the German Ambassador's note to Secretary Lansing. That is still unquestionably the disposition of the nation; but in the fortnight that has since passed there have been developments whose effect inevitably has been to emphasize the incompleteness of the assurance rather than the gratifying purpose of friendliness towards this country, and of a desire to satisfy its plain demands, to which alone the communication could be ascribed.

In the news of last week there were two items that are well calculated to fix attention on vital points that remain to be cleared up. One of them is a reminder of what happened at the beginning of the Lusitania trouble, the other is a fresh and highly troublesome contribution to the question of the Arabic. The commander of the submarine which sank the Arabic, so far from being, as had been thought, at the bottom of the sea himself, is very much alive, and has reported to the Admiralty that he torpedoed the Arabic in the belief that she was about to attack the submarine. Moreover, the German Government, in a note on the subject, has expressly signified its own satisfaction with this explanation. Without entering into the question of what degree of justification the commander may have had for his suspicion, it is obvious that if peaceful passengers and crews on merchant ships are to hold their lives at the mercy of what the commander of a German submarine may happen to think the ship is about to do, their safety hangs on a very slender thread. Exemption from the requirement of warning and visitation, if it can be obtained on these terms, is evidently so elastic that there is no telling, in any given instance, upon what new ground it may be claimed. In our first Lusitania note there occurred this sentence: "Manifestly, submarines cannot be used against merchantmen, as the last few weeks have shown, without an inevitable violation of many sacred principles of justice and humanity." Later experience caused President Wilson to modify his view of this matter; but this latest phase of the Arabic affair must inevitably compel him once more to reconsider the question. He cannot content himself with a general assurance which in any particular instance may be reduced to nothing better than an empty form.

These considerations come to the mind with special force in connection with the other item of news to which we have referred. The man who shortly after the sinking of the Lusitania asserted under oath that he had seen guns mounted aboard her, has pleaded guilty to the charge of perjury. This disposes for good and all of the legend of the "armed Lusitania." That she was armed there has never been adduced a particle of evidence worthy of a moment's consideration; that she was not armed was attested in the most absolute manner by the regularly constituted authorities of the Port of New York. Yet the German Government in its reply to our first Lusitania note declared that "the Lusitania, according to information received here, had cannon aboard which were mounted and concealed below decks." Concerning the source of this "information," nothing whatever has been revealed by the German Government; nor is there the slightest reason to suppose that the appalling crime of May the seventh was in reality brought about by the existence of any real information of that kind. It should be remembered in this connection, moreover, that the warning advertisement inserted in American newspapers on behalf of Germany just before the sailing of the Lusitania made no sort of reference to any such ground for the contemplated act of murder. In view of all these things, it is impossible to rest complacently in the assurance that the German Government, still less the individual commanders of German submarines, will carry out in good faith all that was promised—and more than was at all clearly promised—in the few lines in which Count Bernstorff announced his country's new policy.

The delighted welcome that was given to that communication was due less to its exact words than to the spirit which seemed—and which we still believe was—behind the act. It is hardly conceivable that Germany could wish to place herself in the position of trifling with the solemn demands of this country. That she might reject them was conceivable enough; that she should make a feint at granting them, only to show in a little while that she meant nothing of any value, we cannot believe. What is wanted now is that clear-cut and comprehensive understanding of which Count Bernstorff's note can be regarded only as a forerunner. What is wanted is neither more nor less than that which President Wilson set forth in the very first sentence of the first Lusitania note:

> In view of recent acts of the German authorities in violation of American rights on the high seas, which culminated in the torpedoing and sinking of the British steamship Lusitania on May 7, 1915, by which over 100 American citizens lost their lives, it is clearly wise and desirable that the Government of the United States and the Imperial German Government should come to a *clear and full understanding* as to the grave situation which has resulted.

It is all very well patiently to thresh out the particulars of the Arabic case, patiently to investigate the facts regarding the Hesperian. But to fix attention upon these alone is not to see the forest for the trees. The immediate need of the moment is that "clear and full understanding as to the grave situation" which President Wilson set out to obtain on May 13, and which recent events, whatever be their explanation, show to be as essential for the safety and honor of the nation as it was four months ago.

DR. DUMBA'S DISMISSAL

The country has acclaimed the President's action in asking for the withdrawal of the Austro-Hungarian Ambassador, Dr. Dumba. From the moment when the New York *World* published the contents of the letter which that official entrusted to Mr. Archibald, no other outcome has been possible—provided that no legitimate explanation was forthcoming. There was none. On the contrary, Dr. Dumba sought to brazen it out on the theory that he was thereby saving from prison three hundred thousand of his "nationals" who would naturally desire to return to Austria-Hungary, and that it was his duty to protect those citizens of his country, even to the extent of getting them out by means of strikes, the real purpose of which the Austro-Hungarian beneficiaries might never even know. But the fatal sentence in his letter as to the German military attaché's belief that these strikes would disorganize the munitions industry at Bethlehem and in the Middle West, so clearly showed that self-interest was mixed up with the benevolent purpose as to leave him in a hopeless predicament. And so, despite the

friendliness of the American Government for Austria-Hungary, as clearly evidenced by the admirably worded note forwarded by the State Department, Dr. Dumba is properly compelled to go. In all probability his career is at an end.

His downfall is plainly due to a total misconception of what are a diplomat's proper functions when stationed in a neutral country in time of war. The circumstances have, we admit, been particularly trying. It is a good deal, we suppose, to expect diplomats to sit quietly by while they see everything going against them, first the current of popular opinion, and next, because of the British control of the sea, a steady flow of supplies and ammunition to their enemies. But that was the fortune of war; it was precisely that which Germany and Austria risked when they took up the sword, and it was not the duty or the right of any diplomat to try to offset it by underhand means. For that was to make a battleground of the United States and to assume functions no longer diplomatic, but distinctly belligerent. Only on the assumption that diplomacy is a word which covers every kind of chicanery, every kind of interference with the legitimate domestic affairs of a nation, can Dr. Dumba's course be justified. One has merely to imagine, if one can, what would happen to an American diplomat who should seek to start a strike in the Krupp works for the benefit of his country, to see how scandalous Dr. Dumba's plan was.

Nor is the situation affected by the fact that the 300,000 Austro-Hungarians for whom he sought to act are still subjects of his Kaiser. If they were in danger of forever cutting themselves off from returning to Europe because of ignorantly taking service in munitions establishments; if they, as Dr. Dumba alleges, are miserable "white slaves" working "twelve hours a day," then the proper remedy was not to buy up venal labor-leaders, but to present the case openly and above board. This Government would unquestionably have advised him how best to warn his fellow-citizens, and if it is true that men are being driven to work twelve hours a day for seven days a week, the proper appeal lay to our Department of Labor and to the American conscience. The whole difficulty would have been avoided if this course had been followed. That it was not shows both how naturally some diplomats resort to subterranean methods and how ignorant Dr. Dumba, for all his astuteness, was of the spirit of the American people.

Surely he should have learned from the daily press how deeply stirred our public is by the constant publication of stories that foreign diplomats have been interfering in our domestic concerns. His duty—the purpose for which he as a diplomat was accredited to this country—was to keep the peace between the two nations, and not to recommend to his Government a policy which was bound to alienate them if the slightest proof of it were to come to light. Certainly, Dr. Dumba cannot have been aware that a British Ambassador was sent home merely for advising an American citizen how to vote. He cannot have realized the high spirit of the American people, how sure is their sense of justice, how quick they would be to resent what they considered an unpardonable wrong; and he cannot have understood the positive wickedness of the proposal made to him which he so promptly made his own. The man who foments labor troubles for ulterior purposes, be he capitalist, or foreigner, or venal labor-leader, is a public enemy.

We trust that Dr. Dumba's fate will prove a warning to others. Nine-tenths of the stories published about the activities of the German Embassy we assume to be untrue, partly because they are themselves so unsupported, and partly because if they were true our State Department must long ago have acted as vigorously as now. But the sole function of military and naval attachés is to report to their Government military and naval conditions in this country, and we fear that Capt. von Papen and Capt. Boy-Ed have construed their duties here in entirely to liberal a spirit.

CHANGE IN RUSSIA?

The assumption by the Czar of the chief command of the Russian armies is much more significant as a symbol than as a fact. It is plain recognition of the serious situation which confronts the Empire, and of the need of rallying the nation's energies to a supreme effort. For his part, the Czar, by placing himself at the head of the armies, is trying to bring into play whatever magic still attaches to the person of the autocrat among the vast peasant population of Russia. But brute mass alone will not suffice. The will and the energies of the intelligent classes must be brought into action; and that is why, simultaneously with the replacement of the Grand Duke Nicholas as commander-in-chief, comes the replacement of the Conservative majority in the Duma by a Liberal-Progressive coalition. For some time there has been talk of the organization of a Ministry of all parties, similar to that which arose in France during the first weeks of the war and subsequently in Great Britain. Some such "sacred union" is the natural outcome of defeat in the field. But in Russia, as we have it to-day, there is not to be union of parties, but a replacement of parties. The Conservative element which has been in control has not merely been found wanting, it has been found inimical to success. Once more Russia has learned that reactionary ideals are unfit to survive in the modern competition of great nations.

It is three weeks more than ten years since the disasters in Manchuria, by stirring up a nation-wide demand for change, elicited the Imperial rescript of August 19, 1905, in which the convocation of a national Duma or Parliament was promised. It is three weeks less than ten years since the representatives to the congress of Zemstvos declared at Moscow that the nation would not be satisfied with the shadowy Parliament promised in the Czar's proclamation. So now the news comes from Petrograd that the Liberal elements in the Duma will not be content with a perfunctory recognition of their numerical strength, but that a thorough reversal of policy must come if the nation is to rally with all its will to the hard necessities of the moment. That the expected change is to take the form, not of a reconciliation of all parties, but of the installation of the Liberal parties in power is the demand virtually formulated by Miliukoff, the veteran leader of the Constitutional Democratic party. The Conservatives are accused of working for a dissolution of the Duma. Miliukoff answers with the threat of revolution. "I believe you understand clearly that in these circumstances a dismissal would be political madness. Let those who are agitating it know, therefore, that if the Duma is prorogued now, we shall meet again in a few weeks, perhaps in a different frame of mind. Let the Duma go on calmly and quietly with its work."

In the programme put forth by the new coalition in the Duma it is made plain that we are not dealing with the overthrow of a parliamentary majority on the ground that it has proved inefficient in a specific task. It is not a question of putting in a Ministry which shall conduct the war more ably than its predecessors. It is a question of putting a new spirit and a new outlook into the Government. What could be done in the way of replacing war ministers, army

commanders, and even commanders-in-chief, in organizing munitions boards and defence councils, has been done. Much bigger changes are put forward by the new Liberal majority: autonomy for Poland, conciliation for Finland, justice for the Jews, amnesty for political prisoners, liberty for the trade unions. It is a reassertion of hopes and demands that flourished during the first flush of victory over the autocracy in 1905, and have since been frustrated. Though these demands are political in nature, they tie themselves up closely with the fortunes of war. It is characteristic of a Bourbonism which never learns, that while Russia was engaged in a war calling for her united energies, the repression in Finland should have been continued with increasing rigor; that the laws of exception against the Jews should have been brutally enforced at the very moment that hundreds of thousands of Jewish soldiers were facing the enemy on the frontier; and that now, in a moment of high crisis, the reactionaries should be plotting for a dissolution of the Duma, when every sign points to revolution as the result.

Defeat, followed by the menace of revolution, is the only way in which the powers of reaction in Russia can ever be taught; and even then the lesson is soon forgotten. For the moment, however, it appears that the ruling powers at Petrograd have recognized, what has been evident to the enlightened elements in Russia, that the reactionaries and the bureaucrats have not only brought defeat upon the nation in battle, but undermined Russia's moral position before the world. More than once we have referred to the handicap under which the western Allies labor in their association with a Government that stands for political, racial, religious, and social repression. In this country pro-German sentiment is to a very great extent anti-Russian sentiment. We have the alien populations who have felt directly the sting of Russian oppression, and there is a goodly section of native American opinion which finds it hard to sympathize with the ideals of Russian government. Berlin has recognized its advantage in this respect. It has promised a free national life to the Poles, it has espoused the cause of the Jews, it has lost no opportunity to emphasize its contention of the early days of the war, that it was primarily a war of defence against Slav barbarism. Petrograd could afford to disregard moral issues while its armies were pressing victoriously through the Carpathians. With the enemy driving into the heart of the Empire, the bitter post-bellum lessons of 1854, of 1878, and of 1905 stare her in the face.

THE QUESTION OF A LOAN TO EUROPE.

With the arrival of the commission of eminent London and Paris financiers, representing their respective Governments and banks in conferences on the foreign exchange situation, the question of a large loan, to be made by our markets to those of Europe, has come definitely to the front. The machinery of international exchange is so technical and intricate that the man in the street is hardly to blame for being perplexed as to just what the controversy means. Yet the questions at issue, in the conference between the European commission and our own bankers, are at bottom simple enough.

The first source of perplexity to many readers of the news is the question, why abnormal rates of exchange on London and Paris could be corrected by a $500,000,000 loan, raised by those markets in America. The answer is that the raising of such a loan would enable the English and French Governments to draw on the proceeds, when making payment for their purchases of American materials and supplies. By this expedient, the abnormally large amount of drafts on London for such payments would be to that extent reduced. The problem is not of England's inability to obtain the necessary money from loans raised in Europe; that idea involves a total misconception of the position of affairs. But an American manufacturer, drawing on London against merchandise shipments of any sort, sells his draft to a banker for collection, and the sum total of such drafts has become so enormous, under present conditions in the "war-order" market, that the rate of exchange allowed for them in American money by the New York banker has lately depreciated 7½ per cent. from the normal parity of exchange.

Such a condition is bound to hurt both the European and the American markets. English importers of American goods who have contracted to settle the bill in dollars at New York (which is the case with most of the "war orders") have to pay 5 or 6 per cent. extra, in order to command the requisite American money through a draft on a London bank. But American exporters to whom payment is made in pounds sterling (as is the case with our great staple markets) must equally submit to a 5 or 6 per cent. deduction from the proceeds of the sale, in order to turn them into American money.

Neither market wishes that state of things to continue. Conceivably, enough more gold might be sent from Europe to restore equilibrium. But London and Paris need what gold they have to protect the soundness of their paper currencies; whereas our own banks and Government already possess more gold than ever before in their history. There would always remain the much-talked-of expedient of the English and French investors selling outright, to our own markets, the one or two thousand millions of American securities still held by them. But, waiving the question whether the individual owners of these stocks and bonds are desirous of selling, the prospect of such enormous pressure on our investment markets, with its presumable effect on prices at the Stock Exchange, is much disliked in American financial circles. The compromise plan, for a loan of $500,000,000 or more, appears to contemplate, in addition to the European Governments' guarantee, the pledge of these very securities as collateral. This, if effected, would obviously avert the predicted overwhelming liquidation; American securities thus "tied up" could not be sold until the loan had expired.

We shall not at present attempt to discuss the arrangements as to term of the loan, rate of interest, and so on—practical considerations which must engage the minds of the conferring bankers. It would presumably have to be made payable, interest and principal, in American dollars, and it would certainly have to be free of the income tax, which the British Government—wrongfully and unwisely, we have always believed—has heretofore been accustomed to deduct from interest payments on its bonds, even when made to foreign holders. Probably, any such loan would be made to run for something like five years, and it would presumably be issued in a form admitting of its distribution among private investors. Even the sum total of the loan is still in question; the amount proposed may conceivably exceed the commonly named figure of $500,000,000.

Two other questions remain, however, which have more or less puzzled the public mind. First, will our people be able to buy so enormous a single issue of new securities? Secondly, does not the making of such a loan to belligerent Powers depart from the rule of strict neutrality originally set forth by President Wilson? As to the first question, the abnormal plethora of money in the banking institutions of this country renders un-

derwriting even of so great a loan an easy possibility, and, as for private investors, one notable result of the war to date, with the attendant conditions in home trade, has been the immense decrease in supply of new investment securities offered on our markets.

The objection of neutrality hardly fits the case. The loan, in the first place, would be raised solely to pay for purchase of merchandise in America, and the propriety of that sort of operation has already been recognized, as in the smaller government loan placed here by France. But apart from this consideration, a very noteworthy precedent, all things considered, was the offering and public advertising, last spring, of something like $10,000,000 German Government notes through American banking houses, and their sale to investors in this country.

EASY THINKERS ON HARD QUESTIONS.

Within the past few weeks the chairman of the Federal Commission on Industrial Relations has given expression in several public utterances to his views on some of the largest aspects of the economic organization of modern society. These views are bold, radical, and far-reaching, yet remarkably little attention seems to have been paid to them, and no attention at all of that sort which might naturally be supposed to go with his official position. In some degree this indifference to the lucubrations of Mr. Walsh may be accounted for by the intense absorption of the public not only in the great war, but more especially in the developments affecting the possible implication of our own country in the gigantic conflict. But this explanation is by no means adequate. We are not so absorbed in the issues of the war, tremendous as they are, as to preclude our taking a genuine interest in any genuine contribution to the discussion of vital questions of public welfare. The difficulty with Mr. Walsh is that his conduct during the period in which the Commission was conducting its operations made it plain that he was not the kind of man from whom any valuable contribution to the understanding of the subject could be expected. By this we do not mean that his opinions were sure to be wrong; we mean both more and less than this. His opinions were not sure to be wrong, but they were sure, even if they were right, to be merely his opinions and not the result either of competent thinking or of sober and careful marshalling of facts.

When, for example, Mr. Walsh tells us that it would be a good thing for the nation to take possession of the whole, or the greater part, of all large fortunes upon the deaths of their possessors and use the proceeds for purposes of social betterment, what occasion is there for analyzing the merits of this proposal, or for putting forward the objections to it, any more than there was on the day before? There is nothing novel in the idea itself, nor is there anything remarkable in what he says about it. All that has been added to the world's knowledge on the subject is the fact that a certain Frank P. Walsh, who happened to have been named by the President as chairman of what ought to have been an important investigating commission, and who had thoroughly shown his unfitness for the post, thinks thus and so on the subject of the taxation or confiscation of great fortunes. Nor is the case very different when he assures us that the causes of labor unrest are to be found in low wages, unfair practices on the part of employers, etc. What he says about these things may be entirely true. It is even very possible that with all his blundering and hectoring he succeeded, in the sessions of the Commission, in bringing out some facts of serious importance that were previously unknown or insufficiently known. But his discussion of them, and the presentation of his own conclusions on the great questions which they affect, are of infinitesimal value. Men incomparably better fitted than he to discuss all these subjects, whether from the radical or the conservative standpoint, have been writing abundantly about them for many years; and such authority as his utterances might have been supposed to derive from his connection with the work of the Commission is wholly absent.

In quite a different category, and yet offering occasion for somewhat similar reflections, are the outgivings of many excellent persons, especially clergymen, who undertake in an offhand way to tell us what is the matter with the world and how it is to be mended. In a different category, because from them there is no reason to expect anything but broad general views, prompted by humane aspirations and ordinary intelligence and insight. When a minister of religion discusses questions of economic evil, he is not expected to base his remarks on special knowledge or on expert inquiry; and no fault can be found with him on the score of his confining himself to broad indications of the direction in which improvement should be striven for. It is not enlightenment as to facts, or guidance in the unravelling of complexities, that he is supposed to supply; if he stimulates in his hearers right-mindedness and humanity, he does a worthy work. But if, coming down to particulars, and pronouncing judgment on specific economic and social questions, he treats with a shallow and easy-going sentimentalism the tough problems which men quite as conscientious as he, and infinitely better equipped, find it necessary to grapple with the utmost care and caution, the fact that his intentions are good is but little mitigation of his offence.

The Labor Day sermon is very apt to present examples of this kind of darkening of counsel. A typical case is this, from the report of a sermon delivered in New York:

> The laboring man deserves more of this world's goods. It is not right for a producer to have to walk and watch the rich man, who does not work, ride by in an automobile. It grates on him. As long as we have the present system of relations of capital and labor, we will have the rabid Socialists and the I. W. W. I plead with you to do everything possible to bring about a better understanding between capital and labor.

The most ignorant man in the good preacher's audience could hardly entertain cruder or more futile notions of the problems of society than are indicated in this brief passage. The question that confronts the world is not whether it "grates on" the poor man that walks to see the rich man ride, but whether there is any way of altering the fundamental constitution of society so as to bring about a state of things on the whole better than that which we now possess. To declare that the capitalist is little better than a robber because he has an automobile while his employees have none, is hardly a hopeful way of bringing about "a better understanding between capital and labor." What the worthy gentleman thinks the "rabid Socialists" are after that goes beyond what he seems to be after, we are somewhat puzzled to conjecture. But the truth is, no doubt, that he doesn't know what he is after himself; all that he knows is that things are not as his humanitarian instincts tell him they ought to be. But, so far from tending to bring about such approximation to his ideals as may be practically attainable, the thoughtless stirring up of mere unintelligent discontent is calculated only to increase ill-feeling, and thus to aggravate evils without pointing the way towards any remedy.

Foreign Correspondence

WHAT THEY SAY IN PARIS.

By STODDARD DEWEY.

PARIS, August 23.

It is a pity that American representatives of peace and casual Americans curiously spying out the land for publication should, on arriving in Paris, be able to learn only what they are allowed to see and hear while being personally conducted by chance American residents who are themselves veriest "outsiders" to native French ideas and feelings and sympathies; and, whenever they are handed over to Frenchmen, to find only prehistoric pacifists or those denaturalized by cosmopolitanism or Socialist politicians who have not forgotten the dreams of the Internationale that falled with the outbreak of war. They must expect criticism like the following:

"The women who went to the recent Congress of The Hague have not shown very remarkable wisdom or equity. They acknowledged that 'War is of itself the negation of right,' and so 'they abstained from discussing eventual regulation of it.' In other words, under color of a lofty and unbending adherence to principle, they have excused German atrocities as normal consequences of war. Moreover, these *Congressistes* have undertaken a campaign for immediate peace, that is—always under pretext of their doctrine—for the peace desired by Germany and Austria-Hungary! Frankly, such a demonstration of international feminism will not increase its credit greatly with clear-seeing, right-minded persons. And French women who refused invitations to such a congress were quite right" (leader page of Paris *Temps*, August 25).

Those who have been talking so much of late years about "collective souls" might well apply their theories to the one mind of the French people at present. They, too, are tired of war; and, unlike neutral advocates of immediate peace, they have suffered all that one country can suffer from another in war. But they have no intention to suffer what the enemy calls "honorable peace." Then, indeed, all the bloodshed and misery were in vain and the Terror of the German name would still hang over their children.

In the Stuttgart review *Jung Deutschland* Marshal von der Goltz has just published a letter which intempestive Americans might well puzzle over:

"It is a psychological enigma that Germany should have heaped up such hatred against herself." The Marshal commanded in Belgium in the first bitter days of conquest. And Henry James said that Miss Miranda, of Bangor, Maine, doing Europe alone before proceeding to Boston for "culture," all unconscious skirted abysses!

Parisians, during the first half of August, were more concerned with American buyers of Paris fashions than with American colporteurs of peace. That, at least, might help French men and women to earn a living. On the part of Parisiennes, there is little effort at fashion. There is brightness in the streets, there is elegance even when worn and faded. But there is the recurring reminder—a one-legged soldier on crutches, a woman and girl black-veiled, the eager-faced crowd at a bulletin board—that war is on and must be fought to the end.

"Switzerland has ordered 180,000 new uniforms—they must be for next winter." "My concierge says a soldier told him that General G. assures his men there will be no winter campaign." "What sign is there of the war ending?" "The English are coming with men—and with guns." "It is high time."

Parisian pessimism does not go much further than this wandering talk. There are plenty among the men who criticise this general and ask why that military move was not made, as Uncle Toby and Tristram Shandy did. There are women who have heard their men talk or have gleaned in the papers and ask timidly: "Will Rumania come in soon?" And every one has confidence in what some call Providence and others the unexpected which happens in time.

It is no longer a secret that the hope of final victory is based on guns and ammunition. Every one has heard that the Russians were forced to retreat because they were wanting in guns and ammunition; and the Allied armies along the French line will not attack for good until they have a million shells a day to rain on the enemy. Popular formulas are simple, but that is no reason why they should not be true.

Every one is interested in this manufacture of arms and shells, which is going on wherever a factory can be set up. In my house two refugee boys from the invaded region were in great misery with their sister, a soldier's widow with two babes; and they are now earning almost the support of all of them in some one of these war mills. The whole neighborhood takes interest and passes the word about whenever one or other is "advanced."

There is something, after all, in the scientific flub-dub about the French being gregarious. They talk, and they talk with each other from top to bottom of the social tree—and, as in the kinetic theory of gases, there comes to be an equilibrium of idea-molecules, an average state of feeling, the collective soul. This explains—partly—the great Revolution and the Commune. Happily, this time it has been an equilibrium of patience and order in national defence.

It is another delusion of foreigners that this even resolution depends on the French people being kept uninformed. Now the entire speech in self-defence of the German Chancellor was printed literally and completely in all the Paris newspapers, even those for workmen, the day after it was uttered in the Reichstag. So were the main parts of the German Finance Minister's speech to prove his own country solvent and all her enemies bankrupt. As I have often noted, Swiss papers with German political *communiqués* and the wonderful Wolff dispatches are sold by the hundreds in every quarter. From comparison with American newspapers, in which every one must blaze a way for himself among contradictory cablegrams, I do not think the common people of Paris are less well informed about the real state of things than intelligent people in the United States.

Even the plan for a secret session of Parliament, in which Government and politicians can have it out together, has impressed the people little. They believe that the substance of the secrets to be given out for judgment by Parliament is, after all, only what they call a Punch-and-Judy secret already told. For members of Parliament, of course, there is the desire to keep up to their traditions of Parliamentary predominance. Doubtless, too, there is some underhand politics—such as is not unknown in our own Congress. The people only ask: "When are the English going to begin?" and "When is Gen. Joffre going to make a move?" and "What of the Dardanelles?" The dogs bark, the caravan passes.

I have been very much struck by the hesitation of Parisians in bearing judgment on the American attitude. This is perhaps due in great part to their newspapers; but it is a curious fact. They ask: "Are you going to declare war?" "Is President Wilson a strong man?" (this is very frequent). "Would it not be better for us that you should go on as you are and sell us arms and ammunition and provisions?"

Ever since the neutral nations kept silence when the neutrality of Belgium was violated, the French people have been unsure as to principles and actions of neutrals in general. For America the accepted explanation is: "You have so many German-Americans!" I think, however, it is generally recognized that a country may base its neutrality on the observance of strict legality towards itself alone.

AN INTENSE WEEK—APPRECIATION OF THE PROBLEMS TO BE MET BY "THE LONELY MAN" IN THE WHITE HOUSE —CONSCRIPTION.

By T. L. GILMOUR.

LONDON, August 24.

The publication yesterday of the cables announcing the serious naval reverse suffered by the German fleet in the Gulf of Riga came as a welcome break in the monotonous record of bad news of the past week. There is no virtue in disguising obvious facts. Since I wrote last, the Allies have had a black week. Curiously enough, it is not the things that have happened nearest to us geographically that have made the greatest impression. The revived activity of Germany's Zeppelin fleet has had singularly little effect on the public mind. While the German papers are declaring that it is not so much the material damage done which justified the raids as the effect they produce on the morale of the British people, the simple fact is that the German psychologist is once more wrong in his *a priori* reasoning, and that as instruments for German "frightfulness" the vaunted Zeppelins are a failure. There is not, indeed, very much food for the popular imagination to work on. The information which the Government permits to be made public is of the scantiest. Primarily designed to deprive the enemy of the means of correcting and supplementing the information collected by his observers, this policy of restricting the information published to the barest indication of the locality of the raid, and to a statement of the number of persons killed and wounded, has the effect of depriving the newspapers of any opportunity of working up a press sensation. In London not only is the number of people who have actually seen a Zeppelin incredibly small—which is easily understood in view of the fact that these unwelcome visitors naturally select the night time for their calls upon us—but there are millions of Londoners who have never heard the firing of an anti-aircraft gun.

In short, the Zeppelin, so far, has been as

great a failure as a nerve destroyer as it has been as a military weapon. There is, however, a general conviction that we have not yet by any means experienced the maximum effort of Germany in the air. That is the only medium through which the Germans can "get at" us at all at present. Calais and the long-range guns which are to show the Kentish yeomen what Krupp can do are a long way off, and the occasional sniping of a fishing village by a submarine indicates nothing but a display of temper and how all-embracing is the German disregard for international law. A combined attack of airships and aeroplanes in force is, however, within the bounds of possibility, and while the prospect does not disconcert the public mind, our aviators ask nothing better than that the attempt may be made.

But the events which have undoubtedly very strikingly impressed the public imagination have been the dramatic successes of the German armies against our Russian allies, and the sinking of the Arabic. Of this last tragic happening, I prefer to say very little, partly because from the angle of vision from which we here regard this sinking of a passenger steamer without warning there is nothing that can be said which will add anything to what is already sufficiently known as to our attitude, but mainly because it is so obvious that the issues raised by the torpedoing of the Arabic are of infinitely greater urgency to the American Government and people than to us. Comment which tarries so long on the way, as must necessarily be the case with anything I might say, runs the serious risk of being overtaken by events, so I will merely record the fact that the extracts cabled to us from the American press have been read here with sympathy and appreciation, adding, however, that it is to that lonely figure in the White House that our thoughts have naturally most often turned during these recent days. It would be futile to pretend that no opinions have been formed or expressed as to what America should or should not do in the grave situation which has arisen, or to pretend that there is any stereotyped opinion upon this subject which can be labelled "British." There is no such opinion. But what may, I think, be said with truth is that there is to-day a clearer understanding on this side of the Atlantic than at any time since the beginning of the war of the immense complexity of the problem for which President Wilson has to find a solution. Mr. Tumulty's grave words at Springlake are everywhere accepted as indicating that the situation has reached the extreme of seriousness.

If I were asked to find a single word which would describe the popular feeling during the past week, I should be inclined to select "intense." The Zeppelin raids, the torpedoing of the Arabic, the sudden outburst of naval activity in the Baltic and the North Sea, and the firing by German torpedo boats on the British submarine which was helplessly stranded on the neutral coast of Denmark, the curious reticence of the official reports of the landing of a second British army at Suvla Bay, as compared with the unofficial story of what appears to have been one of the most brilliant exploits of the war, the indications that the smouldering controversy over the merits of the voluntary system as compared with compulsory service is being deliberately fanned into flame by a powerful group of newspapers, the declaration by Italy of a state of war with Turkey—these and other scarcely less important events have so crowded the canvas upon a lurid background of the eastern battle front that men's minds have grown tense under the cumulative strain of what they read. The rapidity with which the German armies in the east have captured the great Russian fortresses and have forced the Grand Duke to contemplate, at least, an immediate withdrawal from the new line of defence which he had prepared, has unquestionably impressed the popular imagination, without, however, in any way weakening the determination to "see the thing through" or the confidence in the ultimate success of the Allies.

A great City banker confessed to me the other day that we had underestimated the economic resources of Germany in time of war; but he added that so long as the Allies were firm in their determination not to be beaten, they could not be beaten. That determination was never stronger in this country than it is to-day; it is equally strong in France. What then of Russia? It is quite evident that Germany is raining blows on her gigantic eastern neighbor in the hope, if not in the belief, that Russia, despite the engagement that she has entered into with her allies, may be forced to cry "Hold! enough." Once more German psychology is, I believe, entirely at fault. Russia's attitude is that of Henley:

My head is bloody, but unbowed.

A friend who has just returned from Petrograd tells me that he did not meet a single Russian who was prepared to admit that Poland would remain permanently in the possession of the Germans, or who did not believe that Galicia would be reoccupied before the conclusion of peace. Events may quite well prove any particular forecast of this kind to be erroneous, but the value of such statements does not lie so much in the intrinsic importance to be attached to them as in the light they throw on the spirit of the people. In no country is the detestation—it is impossible to use a milder expression—of the German spirit more intense than in Russia, and even if there should be in the ranks of the court party or the higher bureaucracy certain individuals who foresee in the defeat of Germany a menace to the continuance of their own power, it is certain that they are helpless to force upon the nation a disgraceful peace involving the recognition of German overlordship in the Russian Empire.

Meanwhile, in this country the successes which Germany has obtained on the eastern front have been vigorously exploited for all they are worth by that very voluble section of the community which sees in the adoption of universal compulsory service the only salvation, not merely for England, but for Europe. It is impossible to do more this week than to state the position in the most general terms and to utter a single word of warning. We are asked to believe that this country is doing less than our fair share in the general effort to defeat the Central Powers and their Turkish ally, that both France and Russia are keenly alive to our shortcomings, whatever Italy may think, and that the only way in which we can hearten our allies and strike terror into the hearts of our enemies is by compelling every man to serve the country as and when and where he may be directed to serve by "the Government." Obviously there is much to be said on each of these statements before any of them can be accepted as fairly representing the facts. But any examination of this kind must be reserved for a future occasion. To-day it must be sufficient to say by way of warning to those observers at a distance who may find it difficult to appraise the values in a controversy of this kind, that they will do well not to lend too ready an ear either to those extremists who have argued themselves into the conviction not only that we cannot, but that we ought not to win the war without compulsion, or to those other extremists who are prepared to risk the loss of victory rather than to yield one iota of that personal liberty which is admittedly among the most cherished of our possessions. The great bulk of the people is in neither camp. The country does not want conscription, but will accept it if the responsible Government tells us that its acceptance is necessary to the winning of the war. But it must be the responsible Government that tells us.

Notes from the Capital

AN INDIANA PRODIGY.

The latest prominent American to investigate the European war on the spot and come back to tell us all about it, is Albert Jeremiah Beveridge, of Indiana. This is not the first time he has given such rein to his journalistic instinct. Before the ink was fairly dry on the treaty of peace with Spain, and before half the people of the United States could find the Philippines on the map, Beveridge saw his opportunity. He had just been elected to the Senate, and felt sure of a large audience when he should exploit his discoveries in a speech to that body, for it would be printed in the next day's *Record* and be spread broadcast over the country under franked wrappers. So he hastened to the archipelago, looked it over with the eye of a connoisseur in Oriental islands, and prepared an oration covering the whole annexation movement.

A stated address to the Senate from a newly enrolled member was substantially without precedent, but Beveridge had always revelled in doing unprecedented things. It was one of these—his bold demand, as a boy orator destitute of lawmaking experience, that the Legislature of Indiana send him to Washington—which had startled the time-tried Hoosier politicians into putting him where he now was; and he could see no reason why his present defiance of Senatorial etiquette and tradition should not operate as a good advertisement. It did. The leading newspapers reported his speech at great length, from printed slips he had already distributed. Nearly all noticed it editorially, either to criticise or to commend, and for fame-making purposes he didn't care which attitude they took. Only one of his fellow-Senators undertook to answer it seriously, though two or three others poked fun at it. Praise, blame, or satire—everything was grist for his mill; and within a week this small, lithe, beardless youngster could fairly claim to be the most widely talked-about man in America.

Next he went abroad and took a look at Russia when she was getting ready for her war with Japan, and on his return published "The Russian Advance," which convinced thousands of Americans that the Japanese had not the ghost of a chance in the impend-

ing struggle. Now he is once more preparing the public mind for mighty events in the Old World, lest otherwise they might come upon our generation unheralded.

Like Bryan, Beveridge has been an orator from boyhood. While he was following the plough on an Illinois farm his fondness for coining resonant periods found an outlet through his commands to the draft-animals who were his only audience. When he passed from the farm to the logging-camp, his "bunkies" lent respectful ear to his eloquence; and graduating thence into a country college, he lost no time in announcing himself a candidate for a part in all the oratorical contests which came that way. In one of these he happened to have Bryan for an antagonist, and defeated him; and in 1896, when the news went forth from Chicago that Bryan had with a single speech hoisted himself from an inconspicuous delegate's place to the head of the Democratic national ticket, Beveridge's significant comment was: "I beat Bryan before, but he has been nominated for President first." Learning that Senator James K. Jones had been the person chiefly responsible for Bryan's opportunity to address the Convention, he put himself as often as possible in the way of seeing and talking with the Arkansan, in quest of valuable points. After his Philippine speech he walked over to the Democratic side of the Senate, engaged Jones in a friendly chat about commonplaces, and then plump—the question that filled his mind:

"Now, Senator, won't you tell me frankly, in the light of your long experience, how you liked my speech?"

"Well," answered the veteran, smiling thoughtfully as he stroked his beard, "since you are bound to have my candid opinion, I should think that if your ideas should some day catch up with your vocabulary, you might cut a pretty good figure as an orator!"

In his law practice, Beveridge's strongest hold is with a jury. His resourcefulness in extemporized dramatic effects is among his most notable qualities. One day a young and pretty schoolma'am retained him to defend her against a charge of having cruelly flogged a refractory pupil. At the trial, Beveridge manifested much concern when the opposing lawyer put the boy upon the stand, made him tell his story of the dreadful way in which the teacher had rained blows upon him with a tree-branch, and by way of proof bare his back so that the jury could see the marks of the punishment. As soon as Beveridge looked at these, his face brightened, and an expression of disdain took the place of his expression of apprehension. "Pshaw!" he exclaimed, "is that all? Here"—handing an attendant his pocket-knife—"go out and cut me a thin switch from the nearest tree."

Taking the switch lightly between the thumb and first two fingers of his right hand, he gave his legs a contemptous half-dozen flecks, and then rolled up his trousers. His calves showed six welts, as thick and as discolored as those on the boy's back, though it was obvious that he could not have been hurt badly. His bland smile as he stepped back met an instant response on the faces of the jury, and the teacher went her way rejoicing. Every one who had witnessed the demonstration was so overcome by it that even the opposing lawyer did not recover his wits enough till after dinner to ejaculate: "By Jove! I wonder whether Bev could have put those welts on his legs before he came into court!"

VIEILLARD.

Automatic Government

OUR EXHILARATING QUEST FOR A POLITICAL MECHANISM THAT WILL TURN OUT A GOOD LAW AT THE TOUCH OF A BUTTON.

By ROYAL J. DAVIS.

It is now three years since the brief but somewhat sensational announcement: "Arizona now leads all American States in forms of self-government." This triumph had been attained within the space of forty-eight momentous hours. On the 16th of May, 1912, the Legislature—the first in the history of the new Commonwealth—passed laws providing for the "advisory recall" of United States Senators, and the "advisory nomination" and "advisory recall" of Federal District Judges. On the 17th, the bills were signed by the Governor. It was in reality a double triumph. President Taft had vetoed the first draft of a Constitution submitted to him by Congress, because it contained a provision for the recall of judges. In consequence, it had been necessary for Congress to pass a second draft, with the offending article omitted. Gov. Hunt, in his first message to the first Legislature of the new State, urged the passing of a Constitutional amendment restoring the article. The legislators, being, as a friendly critic noted at the time, "singularly independent and free in their activities," acceded to the request, and the amendment was ratified by the people in November. The triumph over an unprogressive President was complete, but of itself would not have given Arizona the dizzy distinction of leading all American States in forms of self-government. This exalted position was due to the fact that the "advisory nomination" and "advisory recall" provisions were but the completion of a structure that had been well begun by the "Constitutional initiative," the "direct statutory initiative," and the "referendum."

I.

If Arizona had thus expressed formally her distrust of her Legislature, the only difference in this respect between her and some of her sister States was that she was forehanded enough to put herself on guard against it previous to its initial appearance upon the scene. Prevention in order to avoid the necessity for cure was evidently her motto.

This distrust of Legislatures is a recent development, at least in the proportions it has assumed. Our fathers, and especially our grandfathers, were more inclined to distrust the Executive, looking to the Legislative to save them from the encroachments of the more arbitrary authority. In our day the Executive makes no bones of denouncing the Legislative for its unresponsiveness to the popular will. We expect a new Governor to make himself solid with us by telling us that the men whom we elected at the same time that we elected him, and for the purpose of working with him, are a poor lot, whose powers or numbers should be reduced, while his own influence over government should be augmented. A Governor of Kansas suggests a small Legislature of one house, chosen for four or six years—double, that is, the period for which legislators are ordinarily elected—and with the Governor as a member. A Governor of Washington also recommends a small unicameral Legislature of twenty-five members. Oregon voted last November to retain her Senate, but a full third of those voting upon the question favored abolition. Even the Governor of Arizona, whose Legislature apparently started out so well, advises a one-house body of from five to fifteen members. But Oklahoma has come nearest the goal. Had it not been for the requirement in her Constitution that an amendment must receive a majority, not simply of the votes cast upon it, but of the total vote cast at that election, she would be trying the experiment of a one-house Legislature of eighty members, empowered to choose, in their turn, a commission of fifteen. The vote for this amendment was 95,000, to 72,000 against it.

The indictment of our law-making assemblies has two counts: it charges them with betrayal of the public, and with stupidity. Either, if proved, is enough to condemn, if we can supply the place of the condemned. The first charge used to be more loudly made than the second, but this order has been reversed. One hears less of the venality of our law-makers just now than of their stupidity. Stupid they must often be admitted to be, with a stupidity ranging from mere obtuseness—a negative defect—to absurdity and fanaticism. There is nobody like a Governor for holding them up to scorn for this weakness, and, among Governors, Hodges, of Kansas, has furnished the most picturesque bill of particulars. He and his Attorney-General did their best to scrutinize the flood of bills that poured through the legislative mill-race, but in spite of their care they discovered, at the end of one session, that two chapters of the laws were duplicates of another two chapters. The thoroughness of that Legislature was proved up to the hilt by its repeal of one law three separate times: by section 3 of chapter 75, by section 2 of chapter 123, and by section 7 of chapter 124. The sober second thought followed fast upon the heels of the first impulse when chapter 318 was amended by chapter 319. More confusing was the procedure in reference to another law, which was repealed, and afterward amended and repealed again. A law governing the inspection of hotels and lodging houses contains what Gov. Hodges calls "three distinct, different, and diametrically opposite sections." Even a lawyer, he fears, could not possibly say when the law becomes operative, "and yet this bill was drawn in the origin by its friends and handled by them all through its process of enactment."

"If any stallion or jack," read one bit of legislation, "escape from his owner by accident, he shall be liable for all damages, but shall not be liable to be fined as above

provided." The Governor hopes that the courts will construe this regulation without too close attention to its grammar. It is less reprehensible, however, than a bill that had for its purpose an increase of from 3 to 13 cents a day in the amount of wages paid to the wives and children of convicts of the State. So clumsily was it drawn that the Attorney-General had to bring his imagination to the rescue in order to continue paying the three cents, let alone the additional ten that the bill was intended to provide. It is not the most uncommon thing in law-making for a measure to pass both houses twice; a more unfortunate phenomenon is the appearance of a negative which reverses a bill's desired effect. A favorite device of the opponents of a measure is to move to strike out the enacting clause, but in Kansas—and doubtless in many other States—bills reach the Governor quite innocent of this decoration. If one found in the early statutes of Oklahoma a full set of regulations for the government of harbors, wharfage, and lighthouses, one might conclude that a Swiss navy was not such an absurdity as it is usually regarded. The explanation is, however, that these regulations were taken bodily from the laws of Texas, with what we must admire as extraordinary long-sightedness.

Many hours were spent by the Kansas Legislature that committed these various misdeeds in discussing and passing a bill relating to "chiropractic." The Governor was wary and allowed the bill to become law without his signature. Upon examining it closely, he found that it required him to appoint as members of a board three "chiropractors" who had practiced their art in Kansas for two years in the immediate past. But in order to comply with this provision, he would have been compelled to appoint men or women who had been openly violating the medical registration laws of the State for the same length of time. He did not care to undertake that responsibility. The worst thing about this precious bill was that it, and others no better, like the "pure shoe" bill, had consumed so much time that the closing days of the session were choked with legislation of the utmost importance, for which there could not be even a pretence of deliberation and which accordingly failed. In law-making, it is a fatal error to keep the good wine until the last.

Whatever "chiropractic" was or may be, it occupied the attention of more Legislatures last year than one. While Kansas was arguing its merits, California also was impressed with the duty of providing a State board to examine and certify "chiropractors." Some of the legislators of the Golden State had a larger vision, and proposed to have a similar board for barbers—for which, indeed, some argument might be found. But these measures were of small import beside others of the four thousand of that session. "To eat," began one, "to work, and to be recompensed for enforced idleness is hereby declared to be the inalienable right of every man, woman, and child in this State." It ended by conferring upon the Governor authority to appoint a "citizen of this State to be designated as the Commissioner for the Abolishment of Poverty." One bill gave school boards power to regulate the dress of school children. (An Ohio legislator recently proposed to protect the modest feelings of himself and his fellow-Buckeyes by a drastic law relating to women's apparel, but his colleagues felt unequal to the job.) Another bill created the office of Bee Commissioner. A third made it a misdemeanor to keep any bird in a cage less than three feet square; the height seems to have been immaterial. Still another graciously provided that soldiers who did not like the fare at the Veterans' Home might commute their privileges there into a pension and live where they pleased. One member of this Legislature remarked that it was attempting to regulate everything but the birth-rate—surely a most incautious suggestion.

II.

It must be evident that even our best Legislatures are only human. Gov. Hodges admits as much when, after pointing out the inexcusable mistakes of omission and commission made by the law-makers of his own State, he says: "With all that, the Kansas Legislature of 1913 was as efficient, as capable, as upright and honest, as any Legislature that ever sat; it passed many wholesome laws. There was not a single suspicion of corruption." Taking from this praise the proper discount for local patriotism, we nevertheless are forced to the conclusion that the Legislature won't do. Like the steam engine, it is a terrible waster of energy. We have no choice but to follow the example of the farmer in the fable and rely upon ourselves. Yet this ideal, being an ideal, is impossible of realization. Most of our time—and, if the truth be confessed, our interest—is taken up with private affairs. We shall have to retain the Legislature for the routine. But we can have some push-buttons, neatly labelled I., R., and R., which we will push when we can't get what we want otherwise.

The Recall button we do not use much. Cities adopt it in a pleasant glow of anticipation over the new bit of machinery, but when they realize that, despite the sweet abruptness that its name suggests, it means in plain English holding an election over again, their customary reluctance to enjoy the voter's prerogative oftener than is necessary asserts itself with paralyzing effect. Perhaps they have a glimmer, also, of the uncomplimentary fact that, while the Initiative and the Referendum are indications of our distrust of the Legislature, the Recall shows distrust in ourselves. Inertia is thus enforced by the ethical principle—or the sporting instinct—that we deserve to suffer the results of our acts.

But the I. and R., that two-headed hammer of Thor, is subject to no such qualifications. We invented it to do the work that our Legislatures would not do. It is a bit puzzling, therefore, to find that it is not always swung with effectiveness—but this is the verdict of the highest authorities, that is, the warmest advocates of it. "We are very sorry," sighed *Equity* some months ago, "that South Dakota, the first State to have the I. and R. in its Constitution, voted against a Constitutional Convention. We hoped that this State would also take the lead in drawing and adopting a thoroughly modern State Constitution. But, like Indiana"—like Indiana, one of the States that are still wandering in the wilderness without the I. and R. pillar of cloud and fire—"it missed its opportunity. Now instead of being a leader, it will become a follower." An I. and R. State a follower! Is such a thing conceivable? Then there is Colorado. "Efforts to alter or improve the Initiative and Referendum amendment in the Colorado Constitution . . . proved unavailing." Proposition No. 4, in which Judge Lindsey's Social Service League was particularly interested, was defeated by a vote of two to one. The failure of these amendments is attributed to "the general reaction experienced in other States" also. Of all the proposals submitted to the people last November that can fairly be called progressive, no less than 60 per cent. were voted down. A Legislature could hardly have done worse.

Indeed, if it had been a Legislature that had done so badly, there would have been the solace of saying that the people had been misrepresented. But when the voters betray themselves, who is there to mourn? Even Arizona, despite her leadership in forms of self-government, wavered. By an oversight that is simply unaccountable in so enlightened a community, she had failed to guard measures adopted through the instrumentality of the I. and R. from repeal by the Legislature. From the Governor she had taken the power of veto over such laws, but the legislative wolf was free to gobble them up. Surely there could be no doubt of an overwhelming majority for an amendment that merely prohibited the Legislature from undoing the work of the people. Yet the vote was 16,567 for and 16,484 against—a majority of 83 votes in a total of 33,000. To add to the mystery, it appears that only two-thirds of those voting on candidates voted either way on this "important improvement," although three-fourths of the whole number voting voted upon such comparatively trivial matters as a $5,000,000 highways bond issue, old age and mothers' pension laws, and the creation of a new county.

III.

Legislatures are human. Can it be that voters are human, too? Yet how else explain their attitude upon measures in which those who would liberate them from the representative yoke are so deeply interested? It is not only that they vote wrongly. That is their right. As *Equity* graciously concedes, "they should vote for or against, as best suits their sovereign pleasures." But

what if they fail to vote at all? In Minnesota, an I. and R. amendment received 168,004 votes in November, with only 41,577 against it. Yet it was defeated, because the cruel Constitution provides that an amendment can be carried only by a majority of the total vote cast, not for it, but for candidates who are running at the same time. As the candidates polled 356,000 votes, the amendment fell short of adoption by 10,000 votes. A pitifully narrow margin! But look at the figures again, and see whether the case of the defeated amendment is so pitiful. The candidates polled 356,000 votes. The vote on the amendment, including both favorable and adverse ballots, was 209,000. Two voters in every five were indifferent to the amendment, and yet it almost went into the Constitution. The one amendment that was carried received only 223,000 votes.

This indifference is so common that the apostles of direct government have made it an article of their faith that a majority of those voting on a measure shall be sufficient to carry it. Those who do not vote upon it shall not be counted. "People who don't know enough to vote on a question or are not enough interested to do so, are not entitled to be counted as against those who are for it." Voters shall be divided into three classes: supporters, opponents, and indifferent. The indifferent may outnumber the other two, but the fight shall be decided without them.

The objection to this position goes to the centre of the cry that government must be restored to the people. If a majority of the voters regularly fail to vote for laws that are submitted to them, so that it becomes necessary to provide that those who do not vote upon them shall not be counted either for or against them, does it not look as if the people were not quite so eager to "rule" as those who assume to speak for them had thought? And is it consistent with professed regard for the popular will to provide that the indifferent, instead of counting as indifferent, shall not count at all? Is there not a right of indifference? Must the voter drop everything else and line up on one side or the other whenever eight per cent. of his fellow-voters so demand? The fact is that the advocates of direct government have shifted from their original position of restoring government to the people and are now pleading for putting it into the hands of any group that is more interested in a particular question than is the mass of citizens.

The suspicion that voters are made out of the same clay as Legislatures is strengthened by the occasional circumstance of the adoption of two conflicting measures at the same election. It is a little difficult to blame Legislatures for doing in the busy grind what the voter does with ample time for preparation. The danger has been rather cleverly met in some States by a provision that if two conflicting measures are carried, the one receiving the larger number of votes shall stand. It is somewhat of a shock to find that the sovereign people must be provided with protection, not only against Legislatures, but even against itself.

One valuable contribution to political philosophy that has been made by advocates of the I. and R. must not be overlooked. The objection that "the fundamental distinction between Constitution and ordinary statutes will be destroyed is not nearly so formidable as many American writers and statesmen would have us believe, because the distinction between them is really very hard to determine." This profound observation, which occurs in a pamphlet published by the State Historical Society of Iowa, if it does not throw much light upon the problem of government, at all events enables us to measure our progress since the days of the novices who drew up the Federal Constitution.

Correspondence.

A WORD TO THE MODERATELY RICH.

To the Editor of The Nation:

Sir: As one of the moderately rich, with an income, say, of $10,000 to $25,000 a year, I want to express my conviction that the great majority of us, including myself, are acting like hogs. With millions suffering for food and care in Belgium, Servia, and Poland, I doubt if there is a single one of us in the whole United States who has taken the situation sufficiently to heart to make any appreciable sacrifice to help relieve it. By an appreciable sacrifice, I mean any real curtailment of our pleasure at all comparable to that involved in the giving of half a dollar by a laboring man or woman. Many of us have given a few hundreds or perhaps a thousand or two; but I don't believe a single one has gone without a new car or a summer trip or anything in that class, on account of what he has given to relief funds. If there is such a one, I should very much like to get his address. Let me ask these people if it would not be little enough for them to give some of the relief funds as much as a half or quarter of their annual surplus, which they would otherwise salt down for the benefit of children already, in most cases, suffering from the effects of too much luxury. To descend to personalities, I had given up to June about $600 to the different funds, and my friends seemed to think that that was doing quite well; but when I found that the exigencies of my family demanded a $1,000 trip and a new $2,000 car, I felt so cheap that I sopped my conscience by sending $2,000 to the Servians. Not that this removes the mark of the hog. I ought to give another $5,000 without batting an eye, but I am not man enough. What I will do, though, is to give another $2,000 to the Belgian Red Cross Fund, if nine or more other readers of the *Nation* will give an equal amount to any of the relief funds; and I will send a check to your care whenever you say that I should do so. O.

HOLDING BACK WHEAT.

To the Editor of The Nation:

Sir: As I write this I am on a railway train going through the richest part of the Nebraska winter wheat belt. One week ago to-day I came through the spring wheat belt of North Dakota and Minnesota. In spite of a very wet season in the former territory, what appears to be a bumper crop has been cut, and all accounts agree that in the latter the yield promises to be 10 per cent. above expectations. In both sections I notice a peculiar condition, viz., the farmers are stacking their wheat. In the last one hundred miles I have noticed but one threshing machine at work. In the West farmers have no way of holding wheat after it is threshed except to sack it, and the cost of sacks makes this method too costly. Where they intend holding it they stack it, otherwise they haul it directly from shock to the thresher, and the grain, in box body wagons, directly from the thresher to the elevator, where they receive cash for it. It is very evident, then, that there is a widespread determination among the farmers to hold their wheat.

At breakfast this morning I met a man and our conversation centred on this subject. He said he was interested in a number of threshing machines, and that this was the poorest season his business had ever known, although the grain was there and would have to be threshed sooner or later. To my question as to why the farmers were making such elaborate preparations for holding the crop he replied:

"It's the war. I've got it figured out this way. A very fair proportion of the farmers in this section are Germans and are anti-Ally in their sentiments. As a rule, these German farmers are prosperous and are influential in their counties. These men feel that if the American wheat crop is marketed, it will be an aid to the Allies—the English especially—and they are going around among their neighbors and telling them that the Dardanelles cannot be forced, and that wheat is bound to go to $2 a bushel before long, advising them to hold it."

Whether this theory is correct or not, I cannot say. I tell the tale as 'twas told to me. That the wheat is being held beyond any precedent is a certainty. I am connected with a large granger railway, and I know that our loading of grain is running about twenty-five cars a day, when with average crop conditions it should be four hundred at this season. James B. Latimer.

Chicago, August 31.

THE AMERICAN HISTORICAL ASSOCIATION.

To the Editor of The Nation:

Sir: A pamphlet bearing the names of Frederic Bancroft, John H. Latané, and Dunbar Rowland, and the title, "Why the American Historical Association Needs Thorough Reorganization," has just been distributed to the Association's members. Its purpose is to carry further the campaign which was waged largely in the columns of the *Nation* last year. Its contents comprise an introduction, a description by Dr. Bancroft of certain existing irregularities, and a schedule of reforms proposed by Professor Latané. Dr. Bancroft, a recent convert to the movement, writes with more acerbity than may be generally approved; and the stress which he lays upon the frequency of payments from the treasury of the *American Historical Review* for the travelling expenses of its editors may be considered undue. These items are of some significance, however, as indications that the group of men who have long been and are still in control

of the Association and its organ of publication have had their sense of trusteeship in some degree dulled. The temper in which certain spokesmen of that group have replied to criticisms tends to strengthen this impression.

But whatever may be the reader's reaction to Dr. Bancroft's indictment, the constructive proposals of Professor Latané are bound to commend themselves to a multitude of the members. They are:

"(1.) The present editors of the *Review* must renounce the claim of editorial ownership and recognize their position as agents of the Association, or give place to a board that will.

"(2.) The mysterious relation that exists between the *Review* and the Carnegie Institution of Washington should be made known to the Association. This information will be called for at the next annual meeting. The arrangement should be continued only in case it suits the best interests of the Association.

"(3.) There is no good reason for allowing the ex-presidents undemocratic life-membership on the Council. Whether objectionable formerly or not, it is now thoroughly objectionable for several well-known reasons; one of them is that some ex-presidents are actively engaged in academic work, have axes to grind, and their presence on the Council virtually deprives the Association of self-government.

"(4.) The practice of promoting the vice-presidents to the presidency has produced unsatisfactory results and should be discontinued. It has given to the ring the backing of three aspirants to the presidency by determining the order of their succession, thus making it all but impossible to break the slate annually prepared by the inner circle.

"(5.) All attempts to end boss-and-ring rule will be futile while the managing editor and members of the board are allowed to be on the Council. The Council should elect and dominate the editorial board and the board should aid and direct the managing editor. It is tolerating just the reverse of all this that has been the direct or indirect cause of most of the unfortunate conditions in the Association.

"(6.) No personal expenses should be paid except after formal approval by a finance committee, and the treasurer's annual report to the Council and to the Association should contain individual and itemized statements of all such expenses."

As a newly elected member of the Council, I have felt it a duty to increase my knowledge of the workings of the Association and to study the possible means of betterment. I have learned that the minutes of the earlier meetings, at which the status of the *Review* was legislated upon, are in part missing and in part, as the present secretary has written me, palpably erroneous. Under these conditions, every person is in a measure free to form his own theory of the official relation between the Association and the *Review*, and no man may convince another of his error. Such a state of things clearly calls for new legislation; and this should be of such a sort as to make the editors of the *Review* definitely the servants, and not the masters, of the Association.

At the present time I find myself in favor of all of Professor Latané's proposals, excepting possibly the fourth in his list. I shall keep an open mind, however, until the time for definite action is at hand. I earnestly hope—and here without doubt I voice the thought of nearly three thousand fellow-members—that the discussion will progress in the utmost mutual good will. Recrimination is wholly out of place. Those who are in controlling office have rendered excellent service, and at the worst have committed errors of judgment in minor concerns and errors of interpretation where the legislation has been ambiguous. On the other hand, the reformers are men of equally high character and public spirit. Exaggeration and harsh words can only hurt the party which uses them. The problem is not as to who shall fill the offices, but as to what offices there shall be and what the functions of their incumbents.

ULRICH B. PHILLIPS.

Bellport, L. I., August 6.

FREDERIC BANCROFT'S REPLY.

TO THE EDITOR OF THE NATION:

SIR: Professor Phillips's *pro tanto* declaration for reform will surprise no one less than the joint authors of the pamphlet he refers to. If he had been able to attend any of our conferences, perhaps he would have advanced with us. On a mere hint he was ready to join in demanding information when officials were trying to keep it back. And what he says about "the group of men who have long been and still are in control of the Association and its organ of publication" having "their sense of trusteeship in some degree dulled," and about "certain spokesmen of that group"—these are ample evidences of independence and courage.

It is important now to guard against any inference that our six propositions were intended to be adequate to the "thorough reorganization" demanded. Those propositions are entitled "Some Proposed Reforms," and the present writer speaks for the joint authors in saying that those propositions are little more than fundamentals. They are followed by a request for suggestions, so that the Association can "develop and push through at the next annual meeting a plan that will end the evils long complained of in vain." Consequently, since the pamphlet was sent out, July 1, there has been an almost continuous stream of most gratifying letters.

In due time the joint authors and an increasing number of active colleagues will give all interested in the reform movement a careful account of what has been done and will make some suggestions about candidates and further reforms. Any time in October will be early enough to fill out the blank ballots recently received from the nominating committee. While asking for suggestions, this committee manifests its eagerness to continue ring-rule by appealing to "a long-standing precedent" to advance one of the ring, although this very precedent is one of our fundamental grievances. The ring itself is, alas, "a long-standing precedent," which could hardly have been possible except by the trades, dickers, and combinations involved in this advancement of its own members through the presidential offices. The sophistry is too feeble and transparent to mislead any one that really desires reform.

For the present, a sentence or two from each of a few letters, characteristic of many, may speak for themselves:

A widely known professor in a large Eastern university writes: "I am grateful for the pamphlet on ways that are dark and tricks that are vain, as exemplified by the shining lights of the American Historical Association. I have been a member of that organization for a dozen years or more, during all of which time I have never had the slightest doubt that strong-arm work was being done to keep out all interlopers from the sacred circle. . . . No whitewashing tactics will go down with a great many members."

A member of the council: "I do not believe that any one will contend after reading that document that there is no ring in the American Historical Association, or that you have [not] successfully disclosed the nature of that ring. The demonstration is so clear that I am surprised that no one was ever before able to locate that powerful organization."

An editor of an historical magazine: "I was amazed at the disclosures. The actual 'ring' and its methods were not unknown to me, and my voice has been raised against them for a great many years; but it seems to me that you, in your pamphlet, have put your fingers upon the sore places and pointed out the remedy."

A New York city professor and man-of-letters: "I do not think that 'shocked' is too strong a word to express my feelings in reading your revelations, at least some of them, for I had known for some time that 'things were not right.'"

A military historian: "Well, you surely make out a strong case on two charges: financial mismanagement, to use no harsher term, and unconstitutional administration. On these two lines there ought, and doubtless will, be drastic reforms instituted at the next meeting."

A distinguished New England historian: "I read the circular with great interest. You certainly fired hot shot into the 'ring.' I've watched the papers to see whether its members haven't quietly died, as their only simple means of escape!"

Another in the same region: "I think, also, you have shown that the editors have established a system of control of the Association which should not be allowed to continue. The exposure you have made of it should be sufficient to cause it to be abandoned."

A Maryland historian: "This pamphlet ought to arouse the interest of every member, and . . . I am willing to do all that I can to help you in this most worthy cause."

A New York lawyer: "I am glad that you had the nerve to fire shrapnel at those literary bosses."

The reformers intend to see to it that there shall be neither forgetting nor twisting nor false explaining of the facts set forth in the pamphlet. They will hew to that line. Those facts cannot be successfully controverted. It is now more than eight months since the editorial board was challenged to explain by what right it had claimed the ownership of the *Review*. Where probably not one other member of the Association, out of the whole 3,000, could have been convinced, the board has wisely not attempted to answer. It is more than four months since this same board was also challenged to explain why a December meeting had for many years been secretly called at great expense to the treasury, and thirty days after a November meeting, when all the business of the *Review* was, or should have been, transacted at one of those meetings. This secret December meeting enabled

the members of the board to get their expenses paid to the annual meeting. Many other serious charges were made in the pamphlet. No one has even attempted to deny any of them, except privately and by representations that will easily be refuted if published. Moreover, the facts for every material statement in the pamphlet were learned from the Association's records; and the officials criticised were, in most cases, first privately given an opportunity to offer explanations.

The slight beginnings of reform that have already been started have been obtained only by virtual compulsion. Considering the offences and the conduct since those offences have become known, we are unable to classify them as mere errors of judgment. And the men that are responsible for them are surely not proper custodians of the reform movement. Let us take an example.

After the increasing demand for some reform could no longer be resisted, the council, ruled by the ring, brought forward a plan to refer the question of a reorganization of the Association to a committee of nine. This, it was assumed, would give the Association a fair opportunity to decide as to what it wished. Just at this time the Association was startled by the claim that the *Review* belonged to the editorial board, most of whom are members of the well-known ring. This claim of ownership was stoutly challenged at the council meeting last December, until a compromise was struck by which it was agreed that the question of the relationship of the *Review* to the Association should be referred to this, of course impartial, committee of nine. But straightway the ring, still holding the entire machinery of procedure, easily managed to have such a committee chosen that it promptly selected as its chairman a member of the ring; for there were not more than one or two reformers among the nine, and they had never been either conspicuous or outspoken. And this chairman was formerly director of the Carnegie Department of Historical Research and the managing editor of the *Review*, and he has maintained the most intimate relations with his successor, who is the one most to blame for "boss-and-ring rule." This being the case, what more natural than that this chairman should be zealous in protecting these non-Association interests? Accordingly, after the compromise had been made, and shortly before the business meeting of the Association was to convene, he begged the present writer, at the request of the aforesaid boss, not to say anything at that meeting about the relationship between the Carnegie Department and the *Review*. As the writer then knew next to nothing about that relationship, and as the question did not come up, the request was necessarily complied with. Moreover, there are other members of that committee and of others who have been beneficiaries of that Department and its director. Bosses in distress are sometimes urgent, and grateful human nature is sometimes weak. Therefore, it's well not to forget the proverb as to whom God helps.

Unmindful of these facts, some persons have thought it strange that the reformers would not trust their plans to that committee and coöperate with it. The facts should sufficiently explain our attitude as to the past and the present. As to the future, I am authorized to be equally explicit. If harmony and coöperation in the interest of the whole Association are desired by those who have been the cause of the lack of them, they can easily be obtained, so far as the reformers are concerned, if only the unfairly made up committee of nine will properly reorganize. The reformers do not ask for a majority; one-third would suffice. If even two members of that committee, including the chairman, will withdraw, and the committee will admit two representative reformers, then the work of genuine reform could begin at once and be ready to be reported to the annual meeting in Washington next December.

But, of course, a proposition so fair and sure to bring peace and harmony to all but a few will not be accepted. The kind of reform desired by those interested in boss-and-ring rule was provided for when the committee was appointed. And since then the good but unwise boss has generously been peddling assurances that reforms satisfactory to the Association would be granted. Unfortunately this began several months before the work of the committee even commenced. Not unnaturally, this has afforded the reformers much amusement. Moreover, experience has taught them to look for infallible aids in the absurd claims and the ridiculous attitudes of the ring, and especially of its boss. The comparatively few reformers that have been deceived by these assurances—that reforms were to be vouchsafed by inveterate anti-reformers—will in due season throw off their illusions. And that will be in time to vote for the needed "thorough reorganization" that has been both promised and provided for.

FREDERIC BANCROFT.

Washington, D. C., September 5.

ANOTHER PROTEST.

TO THE EDITOR OF THE NATION:

SIR: In a circular letter received to-day from the nominating committee of the American Historical Association, I find the following paragraph:

"The committee assumes that, at least until further action by the Association, the long-standing precedent of advancing the existing vice-presidents to or towards the presidency will be followed, but the blanks below afford opportunity of expressing dissent from this practice."

The first vice-president is Prof. George L. Burr, one of the editors of the *American Historical Review*. I regret exceedingly that the members of the editorial ring, which has for years controlled the affairs of the Association, should persist in their efforts to advance to the presidency another member of the board of editors of the *Review*, while the transactions of that board which have been the subject of serious criticism are still under investigation by members of the Council. Furthermore, the members of that board have advanced what appears to be a wholly untenable and preposterous claim of proprietorship in the *Review*.

In thus attempting to elect another one of their number to the presidency, the editorial ring are pursuing their accustomed tactics of trying to becloud the issue. They hope that their candidate can win for them something like a vote of confidence. If they really want a vote of confidence, why do they not resign in a body and put the issue squarely before the Association? Professor Burr should refuse to permit his name to be used in connection with the presidency until the Association has had a chance to pass upon the questions already at issue. While my personal relations with him have always been of the pleasantest character, I shall oppose at all hazards his election to the presidency until the questions involving the ownership and status of the *Review* have been satisfactorily settled. If the editorial ring persists in its plan, and he permits the use of his name, the reformers will gladly accept the challenge and spare no effort to defeat his election at Washington next December.

When charges of ring-rule were first made, we were asked for a bill of particulars. We have given it. If further evidence is demanded, we stand ready to supply it, for since the publication of the pamphlet, "Why the American Historical Association Needs Thorough Reorganization," many additional facts have been brought to our attention.

JOHN H. LATANE.

Baltimore, September 3.

THE WAR'S GEOGRAPHY.

TO THE EDITOR OF THE NATION:

SIR: War may be a good teacher of geography, but there are those who are slow to learn. Perhaps a few examples in proof of this assertion will be appreciated by those of your readers who echo Flaubert's joy over the absurdities of his fellows.

Last September a friend of mine was greatly comforted because, hearing that the Russians were approaching West Prussia, he thought they must be crossing the Rhine. That was early in the war, but only last month another friend thought the Germans, in marching upon Warsaw after the capture of Lemberg, were being lured by the crafty Russians farther and farther away from Berlin. An eminent Harvard professor stated in an article the other day that Germany is only half the size of Texas. Perhaps he meant that she would be if reduced to the proportions he would choose for her. A glaring head-line in one of our leading dailies announced that Bavarian troops were being rushed through Rumania to the defence of Cracow. Why Rumania's neutrality should be violated for the sake of taking Bavarians 800 miles out of their way was not explained. A favorite error concerns the proportion of France occupied by the Germans. The special war correspondent of a widely circulating and complacent magazine declared last November that this section was a fourth of the country; a distinguished pro-German divine declared in March that it was a fifth; the other day I heard it described as a third. As a matter of fact, since their retreat from the Marne, the Germans have held one-twenty-third of France.

But the most delicious blunder I have found occurred in a letter from Germany, published in a New York paper. The writer was loyally predicting the division of the spoils by the victorious Kaiser. After Germany and Austria had been satisfied, Rumania was to receive "a part of Arabia." What part? The desert or that which belongs to Turkey? Was the poor, faithful ally to be robbed for the sake of neutral Rumania? And what was that country to do with her new possession, separated from her by the Bosphorus, the Dardanelles, and the Suez Canal? At last the truth came to me. "A part of Arabia" is the typographical for Bessarabia, which any one can find on the map if he looks for it.

H. CARRINGTON LANCASTER.

Amherst College, August 28.

Book Notes and Byways

A LYRIC MIRACLE.

By LOUISE IMOGEN GUINEY.

TO A LADY WHO ASK'D WHAT HE CHIEFLY ADMIR'D IN HER.

All over I'm in Love with Thee,
As Thou all over lovely art!
There's not a Part but pleases me
Except thy proud, ungentle Heart.

Your Beauty's Light is evident
Though where or how, we cannot say:
Thus unseen Stars i' th' Element
United, make the Milky Way.

Whoever loves your Eyes alone,
A Kind Look only should be his;
And he whose Lips but dwell upon
The Praise of Yours, should lose his Kiss.

I love each Charm, each Grace, alike,
And to them All give all my Heart!
Love did my breast too deeply strike
For Me to know, or name, the Dart.

No student whose ear is sensitive to the undertones of English letters, or to their chronological cadence, would hesitate to give a date to the little poem quoted above. That date, surely, would fall between 1630 and 1650, the perturbed years which managed to bequeath to us the neat melody of "Bid me to live and I will live," and "When first I saw your face," and "Ask me no more." The lines have the romantic point and the dash of languid elegance which belong to "the Warres"; they have also the slightly sophisticated pose, the easily avoidable errors of form—in fact, "the whole bag of tricks." Though not fit to rank with the divine things of the Caroline day, these stanzas are yet recognizably, essentially, and lovably Caroline.

They tell a pleasant tale in Oxford of a distinguished architect who had come to prescribe for some ailing mediæval shrine. He was taken about and shown the half-dozen astonishing specimens of local "after-Gothic"; and first of these, the staircase of Christ Church Hall; and he admired heartily the beautiful spaces above him, the single supporting pillar, and the tenderly wrought fan-vaulting. His host, dean or canon, wickedly feigning, asked: "Just what style and period?" Said the distinguished architect: "Perpendicular; very nice, too. Not later than the end of the fourteenth century." The other went on ever so gently: "What if I could prove to you by our documents that this staircase was built by one 'Smith of London' in 1640?" The visitor's answer is historical. "Sir, no number of documents could prove to me anything which is on the face of it impossible!"

So with the equally astonishing "after-Gothic" of our relic. It is not what it ought to be, but what it has no business to be. We have here no lost manuscript of some contemporary of Suckling's, nor even a modern strain akin to that, such as the nineteenth century could, and sometimes did, play to the charmèd ear. We are accustomed to think of Rochester as the very last English poet of the unbroken line in whose throat the Elizabethan nightingale

—Winter'd, and kept warm her note.

But is the strange beauty of emotion never absent from Rochester's best present in "All over I'm in Love with Thee"? No. That song comes (O unguessable origin!) from the bulky obsolete Posthumous Works in Prose and Verse of Mr. William Wycherley! Such is the "proof of what is on the face of it impossible." The date of publication is 1728, Wycherley being then for some thirteen years dead.

Of all the unblest Georgian argosies, launched under the full sail of a once great reputation, of all the barren unknown scrolls charged with nothing but dull sense and duller ribaldry, commend us to Wycherley's books of verse, posthumous or otherwise, though the posthumous one is the least forbidding of them. Yet there is this gay winning lilt, like a jewel in a nettle-bed. Wycherley, despite Pope's splendid adjective for him (well enough borne out, it must be admitted, in Spence's Anecdotes) is surely, even as a dramatist, a nearly perished name. And who has ever been tempted to think of him as a precious minor poet, and put him in anthologies for the fair? Yet again, for once in his life, there is he, the serene producer, and here are we, the boggled consumers of real poetry! Despite its confusion of personal pronouns and its iteration of rhyme, his conceit of compliment is well-nigh perfect in its kind. It does not withhold its own playful hint of immortality. A lady, a young archly smiling lady of many patches and furbelows, would have a stout middle-aged celebrity confess to her under the boughs of Spring Gardens, or by the courtly candle-light of Vauxhall, what He chiefly Admir'd in Her. Well, she has this exquisite little answer to hover like a butterfly over her forgotten grave. It is almost as if Dianeme had asked the selfsame question of Herrick.

Literature

THE RELIGIOUS QUEST OF INDIA.

Indian Theism from the Vedic to the Muhammadan Period. By Nicol Macnicol. Oxford University Press. 6s. net.

The Heart of Jainism. By Mrs. Sinclair Stevenson. Oxford University Press. 7s. net.

Messrs. J. N. Farquhar and H. G. Griswold, both of them secretaries of organized missions in India and men of liberal views and solid scholarship, are editing a series of books entitled "The Religious Quest of India," the first two volumes of which are now ready. The aim of the series is twofold: to present the facts of the various Indian religions in scientific fashion, supplementing historical investigation with the intimate acquaintance with present-day conditions which the missionary possesses as few others do, and secondly "to set each form of Indian religion by the side of Christianity in such a way that the relationship may stand out clear." The writers of the series do not forget that they are missionaries as well as scholars, and their first aim is the vindication and the victory of the Cross. One may indeed question whether such aims and authorship promise well for the impartiality of the series. It might even be argued that a religion could hardly be presented sympathetically or even justly by one whose chief aim in life is to destroy it. Yet, as the editors remark, "no man approaches the study of a religion without religious convictions either positive or negative: for both reader and writer, therefore, it is better that these should be explicitly stated at the outset." Knowing the authors' point of view in advance, it is not difficult to abstract from it. Moreover, the writers of these series are not missionaries of the old school, but have real sympathy for the religious views of the people among whom they are working; and, besides, one may always skip the last chapter.

It cannot be said that Dr. Macnicol's "Indian Theism" has contributed anything of importance to our knowledge of his subject. The period which he treats has been carefully studied by many able scholars, and as it came to an end three hundred years ago, the "close and direct contact with Indian religious life" from which the series is supposed to draw so much of its value, is able to contribute very little. Hence the book is hardly more than a summary of the work done by many preceding writers, covering in 189 pages a period of about 3,000 years. To be sure, the book does not end with this, but has two additional chapters, one a kind of summary of the summary (entitled The Theology), while the other (Criticism and Appreciation) is a comparison of "the theology" with "the standard Theism of Christianity." Dr. Macnicol's book is sound, scholarly, just, at times even sympathetic, and makes a good introduction to the study of Hindu theistic speculation; but it cannot be called an important work.

A very different book is Mrs. Sinclair Stevenson's "The Heart of Jainism"; for here we have a religion which is still in need of minute scholarly investigation, and in the presentation of which the missionary's "close and direct contact" with the life of the people will be of the greatest value. Jainism was one of the last of the ancient Oriental religions to become an object of study for Western scholars. Until the '80's, in fact, it was generally considered (in spite of the emphatic protests of the Jainas themselves) an offshoot of Buddhism, and a very uninteresting one at that. Thanks to the researches of Bühler and Jacobi, however, it was shown conclusively that Jainism was older than Buddhism, and hence one of the oldest religions in the world. In spite of this, it roused very little interest in the West, and until recently was hardly more than a name to Europeans, outside of a small circle of Sanscritists. The works in England upon it were mostly hidden away in learned journals or in the rather forbidding "Sacred Books of the East"; and the chapter on Jainism in Hopkins's "Religions of India"—a book that has had so large an influence with the reading public—did little more than spread the conviction that this was a particularly unimportant and uninteresting faith, and caricatured it as "a religion in which the chief points insisted on are that one should deny God, worship man, and nourish vermin." In 1903, however, Bühler's little book, "The Indian Sect of the Jainas," was translated into English, and in 1909, 1910, and 1912, respectively, three other short works, written in popular form, were published. The first of

these was Barodia's "History and Literature of Jainaism," the second Mrs. Sinclair Stevenson's "Notes on Modern Jainism"—by far the best piece of work that had been done on the present religious condition of the Jainas; while the third (entitled "Jainism") was by Mr. Herbert Warren, an English convert to the religion which he expounds in over-sympathetic fashion.

The surprising dearth of literature in English upon a religion that is older than Buddha makes Mrs. Stevenson's new book upon the subject doubly welcome. There is no other work in which one can find the history, the doctrines, and the present customs and conditions of the Jainas expounded with thoroughness and in detail. And certainly few other scholars would have been able to do what Mrs. Stevenson has done. For she combines with a knowledge of the ancient sources an intimate acquaintance with present-day Jainas and their Gujarati writings. For eight years, as a missionary in Kathiawad (the centre of Jainism) she has had almost unequalled opportunities to know the men and women of whom she writes, observe their customs, and understand their feelings.

The first five chapters of her book are devoted to the origin of Jainism, the life of its founder or great reformer, and the subsequent history of the Jaina community. Then follow three chapters on Jaina philosophy—a section which (owing to the Jaina insistence upon dividing and subdividing everything in heaven and on earth), necessarily makes hard reading. Perhaps the most important as well as the most interesting section of the book is that which immediately follows the philosophical part, and deals with the life of the Jaina layman and monk, and the religious ceremonies and customs which only one who has lived for years in a Jaina community could describe. In this section of her work Mrs. Stevenson has done for Jainism what the Abbé Dubois did a hundred years ago for Hinduism.

Mrs. Stevenson is a missionary, and she believes that Jainism is bound some day to yield absolutely to Christianity. This, however, does not prevent her from bringing to her study of the religion which she seeks to destroy a very considerable sympathy, and though the reader is constantly reminded that the author is a missionary, he also feels convinced that there is little prejudice and a great deal of real appreciation involved in her account. The fact that the Jaina views everything from the ethical rather than the merely metaphysical or superstitious point of view, is clearly brought out, and the ready idealism and real kindness of most Jaina men and women is abundantly recognized. The author's sense of humor gleams through the scholarly exposition at many points, but she has wisely kept it under considerable restraint, lest in presenting ideas so different from ours she should make the reader laugh when he should seek to understand and sympathize.

In one respect only is the book disappointing—namely, in its failure to make any mention of the very interesting campaign of reform and revival which forms the centre of discussion in the Jaina community to-day. Groups of young Jaina idealists have been formed in various parts of India, organizations have been founded, periodicals published, and schools established with the aim of abolishing various ancient evils and bringing Jainism "up to date." Of all this one gleans no hint in Mrs. Stevenson's book. But of course, it may well be that this reform movement is only a passing phenomenon, and it is possibly for this reason that Mrs. Stevenson thought best to omit it altogether in her presentation of a religion which is 2,500 years old. At all events, it must be said that she has succeeded as none of her predecessors in laying bare to us the Heart of Jainism.

CURRENT FICTION.

A Young Man's Year. By Anthony Hope. New York: D. Appleton & Co.

The author of "The Prisoner of Zenda" and "The Dolly Dialogues" has successfully outlived those youthful triumphs. He will now hardly equal them in point of popularity, but indeed he appears to have nothing of the kind in view. A romancer who deliberately addicts himself to the fiction of "real life," of every-day scenes and people, must expect to find his reward largely in a sense of virtue. But Mr. Hawkins here attempts nothing beyond his powers. His story compares favorably with the fiction of those somewhat younger contemporaries who have abjured romance from the outset. His materials are such as might have been employed by Messrs. Cannan, Mackenzie, Walpole, and company. A young man in London, his adventures material, social, and amatory, rather particularly the last: here is the familiar stuff of current British story-telling. Mr. Hawkins handles it in his own way, and we dare say the younger generation may discern in that way traces of an abhorred Victorianism.

For one thing, his young man is not the queerly named offspring of vulgar parents, but a gentleman. For another thing, he does not marry a barmaid, or achieve an intrigue with a beautiful woman of fashion, or possess himself of a music-hall favorite; though there are moments when we are afraid that (in general terms) he may do any of these things. A maiden of low degree, a pretty actress, and a reigning beauty are all involved in the year of adventure here recorded. But having created Arthur Lisle a gentleman, Mr. Hawkins is so old-fashioned as to hold him to his estate. He has faults and temptations enough, but contends with them, on the whole, pretty creditably. Even the wiles of beautiful Bernedette (who is not without kinship to the Dolly of the Dialogues), though they are too much for his heart, fail to corrupt him. He comes through his year's apprenticeship cleanly, and is properly rewarded, as, after all, people sometimes are in real life. He becomes, by apparently trivial chance, a barrister no longer briefless or lukewarm; and his eyes are opened to the existence of a mate in every way suitable and desirable for him.

The book differs most markedly from the work of the younger men we have named in having a quiet and not uncheerful philosophy, an elderly philosophy, if you like, more specifically embodied in the old justice, Sir Christopher Lance, but pervading the whole story. In short, its author might never have read a French or Russian novel; we never feel that his hero is an Ivan or Jean in disguise. He is English, his scene is English, his author is English. How comfortable, for a change!

Me. A Book of Remembrance. New York: The Century Co.

Personal narratives of this type are embarrassing to the reviewer, with his pigeonholes. Shall he accept them at their face value as bits of autobiography or construe them as pieces of realism in a familiar disguise? Since its beginnings, with Defoe, the English novel has always been setting its critics that poser. The present story is circumstantial in its assurances. It is furnished with an introduction by Miss Jean Webster (author of "Daddy Long-Legs"), vouching for its character as a "human document." It is also an "astounding literary feat," having been written, according to its sponsor, in a hospital, in a space of two weeks—a hundred thousand words! It could be so written, says Miss Webster, because it was "pure reporting." Nevertheless, she admits that the writer is a novelist and a successful one; and we doubt if the novelist ever existed who could make a piece of pure reporting out of the events of his own life. However closely he may stick to his material, there will come moments when, willy-nilly, the figure of his former self becomes "our hero," an object of art. If this be a true story, it is a story told not by a plain citizen, but by a professional story-teller; and therefore of but moderate value as a human document.

It is the story of a year or so out of the life of a girl of seventeen. She is the daughter of an English younger son and ne'er-do-well, who has literally gone to seed in Canada. Her adventure begins as reporter and general factotum of a Jamaica newspaper. She is driven from the island by the advances of a negro magnate, and from a momentary secretaryship to a Richmond physician by similar advances on the part of her employer. She flies to the protection of another Richmond gentleman whom she has met on a train and at once fallen in love with. He sends her to Chicago with a hundred dollars. She becomes a stockyards stenographer, and presently repays the loan. Thereafter he besieges her in cynical fashion, accepting the love she childishly offers him, but not technically taking advantage of it up to the moment when she discovers him to be a pretty thoroughly bad lot, hopelessly involved in sex-intrigues during the very

period of her devotion to him. She herself, while in love with him, has become engaged to three men at a time—but this, she assures us, out of pure good nature and disinclination to give pain. Well, that is not impossible, to seventeen. There is something fine and sound about her, which has protected her even in her love for a skilled libertine; and we leave her at the moment of her escape, confident that she can take care of herself, even though her chosen asylum happens to be New York city.

PROBLEMS IN TRANSPORTATION.

The History and Economics of Transport. By Adam W. Kirkaldy and Alfred Dudley Evans. London: Sir Isaac Pitman & Sons. 7s. 6d. net.

This book was written primarily to assist in the systematic study of transportation problems in the new commercial schools of Great Britain. It includes not only the history and problems of railway transportation, but those of canals and ocean transport as well, including a suggestive chapter on the economics of marine fuel. Frequent references are made to the situation in other countries, with the result that there are interesting comparisons, but in the main attention is concentrated on Great Britain. The authors avoid as a rule any emphatic expression of opinion on controverted questions, contenting themselves rather with a full statement of the conflicting points of view. They have produced a well-balanced and satisfactory treatment of the subject, which will find many interested readers outside the class for which it was prepared, because it makes available the latest developments in England in the problems of management and regulation. The book was written before the outbreak of the war and contains therefore no reference to England's newest experiment with state control beyond a note in the appendix. In this brief reference the authors reach the conclusion that as an example of state ownership the experience of the last few months has been of no value. "A Government system that could not do better than this would never be tolerated in this country."

Of most interest to American readers are the comments of the authors on questions of policy that touch our own problems. The business community of England appears not to be wholly content with its Railway and Canal Commission, not because of its lack of ability or fairness, but because of the cost of proceedings before it. Traders are compelled to employ high-priced counsel to contend against the eminence of the railway legal staff. As a result only large corporations bring their cases before the Commission. It is not surprising that there is some agitation for the abolition of this exclusive court.

Pools and working agreements are common in England and are frequently referred to by advocates of a similar policy in this country. While the authors, following their settled policy, express no decided opinion, it becomes clear that pools are not working there with the smoothness that we commonly assume. From the point of view of the shipper, they possess few advantages and many disadvantages, and it is suggested that Parliament may have to step in if further development takes place along undesirable lines. There is a familiar ring in the contention that the railways of England have reached the point of "diminishing returns" in their earnings; that the companies have been investing more capital without obtaining a proportionately increased return, and that increases in rates to meet increased costs of operation, particularly in the matter of wages, have become necessary.

A chapter is devoted to the railways of the United States, which is in general accurate in its facts and sound in its conclusions. Yet a few inaccuracies occur. The word grange, improperly spelled "grainge," did not, as the authors assert, come into use because the meetings were held in "grainges or barns"; but simply because "grange" means farm, and the membership was confined to farmers. It is not true that the Interstate Commerce Commission has power to arbitrate labor disputes. Confusion was doubtless caused by the fact that the chairman of the Interstate Commerce Commission was at one time a Government mediator in labor controversies. Any one who attempts to compare rates in different countries must step warily to avoid the pitfalls in his attempt to thread the mazes of the problem. The authors have not been altogether successful. Lacking ton-mile figures, they have compared receipts per ton carried in the United Kingdom and the United States and have shown that the cost per ton in this country is approximately twice as great as that in Great Britain. They recognize that this is not due to a lower efficiency of American roads, but to the greater distance that goods are hauled in this country. But then comes this conclusion: "It follows, therefore, that notwithstanding the complaints of excessive rates, cost of transport is not here the burden that it is in America, because the goods transported do not have to travel so far." In other words, we buy a shoddier coat in England than you do in America; hence our clothing bill is less of a burden to us than it is to you. To have this argument possess validity, it would be essential that the *same traffic* should be hauled long distances in the United States and short distances in England. As a matter of fact, much of the more important English traffic has undergone a preliminary foreign rail journey and an ocean trip of many thousand miles.

But it will be a satisfaction to our railway executives to find this final summing up of the American railway situation: "Any one who has little more than a bowing acquaintance with its history, extent, and achievements will agree that from some points of view it is one of the most efficient, best organized, and cheapest systems in the world."

England's inland waterways, it is asserted, are a comparatively neglected and insignificant means of transport. To follow the European procedure and subsidize them would mean a complete reversal of national policy; and even if subsidized, they could do no business unless the railways were forbidden to compete, and such an injunction would be impracticable without government ownership.

TRIBAL CUSTOMS OF AGRICULTURE.

Customary Acres and their Historical Importance. By Frederic Seebohm. New York: Longmans, Green & Co. $4 net.

When he published "The English Village Community" in 1883 Seebohm opened a new and illuminating page in agrarian history. Violently opposed at first, his main contention, that the agricultural system of mediæval England is to be traced back beyond the Anglo-Saxon invasion to the Roman occupation, has steadily gained adherents. Though he turned aside to write on the tribal system in Wales, tribal custom in Anglo-Saxon law, and other subjects, he continued his studies in agricultural origins, and in his latest volume goes back to tribal customs of agriculture in Europe which must have antedated even the Roman conquest of Gaul. Though death overtook him two years ago at the age of seventy-eight before he had completed his inquiry, he was able, fortunately, to arrange such results as he had reached in a series of unfinished but valuable essays which are published by his son.

Customary acres in England vary in size all the way from the tiny Leicestershire acre of 2,308 square yards to the great Welsh acre of 12,960 square yards. These customary acres reach back into a dim past, ages before the establishment of the statute acre of 4,840 square yards. In France the arpent shows similar variations in size. What is the origin and significance of these variations which have persisted through the centuries? Starting with the famous linear table in the Welsh Venedotian code that there are

> 3 barleycorn lengths in the thumb,
> 3 thumbs in the palm,
> 3 palms in the foot,
> 3 feet in the pace,
> 3 paces in the leap, and
> 3 leaps in the land,

Seebohm reckoned that the "land" is the short end of the acre-strip in the open-field system of ploughing, the acre-strip being the amount of land which an eight-ox plough-team would plough in a day. By a series of ingenious calculations, based primarily on the length of the furrow and the shape of the acre-strip, he found remarkable underlying relations between the ancient land and linear measurements not only of the British Isles, but also of France, Spain, Italy, Greece, Rumania, and even ancient Egypt. The old British mile, for instance, is identical with the Gallic leuga of 1,500 paces; both are related to the furrow of a custom-

ary acre, and both were so firmly fixed in local custom that they were not displaced by the Roman mile of 1,000 paces.

Lack of space forbids any attempt to explain Seebohm's metrological discoveries, and it is too soon to say whether further researches will verify his seductive suggestions. Quite apart from the value which they may have in determining the meaning, according to the metric system, of a large number of words of measurement in the sources, Seebohm's suggestions are pregnant with meaning for the student of early tribal migrations and borrowings and of the gradual economic development of primitive communities. The customary acre was not primarily a unit of land measure; it was a unit of land cultivation; its size, therefore, was determined by the nature of the crop, the soil, the communal plough, and the prevailing tribal customs of co-aration. It contains within itself an epitome of the steps in agrarian development. When it is more fully understood, it may be that we can throw overboard the old reckoning of archæologists, who talk of ages of stone, of bronze, and of iron, and adopt instead a more valuable institutional classification by modes of agriculture; when, for instance, we can reckon tribal development according to the use of barley, of spring wheat, and of winter wheat, or according to one-field, two-field, or three-field systems of planting.

Notes

Harpers issue to-day Sir Gilbert Parker's new novel, "The Money Master."

Scribners announce for immediate publication a new novel entitled "Felix O'Day," by F. Hopkinson Smith.

Among the new editions which the Revell Company announces for publication this autumn are: "The Birthday of Hope," by J. D. Jones; "The Law of the Tithe," by Arthur V. Babbs; "St. Cuthbert's," by Robert E. Knowles. The same house also announces "Studies in the New Testament," by Dr. A. T. Robertson.

The first edition in English of the Russian epic "The Armament of Igor" is about to be published by the Oxford University Press. The editor is Mr. L. A. Magnus, who has written a general introduction and gives a revised text, with translation, notes, and genealogical tables. The poem describes a disastrous foray by Igor Svyatoslavic in 1185.

Paul Elder & Co. announce for publication this month "The Architecture and Landscape Gardening of the Exposition," with an introduction by Louis Christian Mullgardt. The second volume of this work, entitled "The Sculpture and Mural Paintings of the Exposition," with an introduction by A. Stirling Calder, is also in preparation.

Books announced by Houghton Mifflin for publication September 18 are: "Letters on an Elk Hunt," by Elinore Pruitt Stewart; "Little Miss Grouch," a novel by Samuel Hopkins Adams; "The Children's Books of Birds," by Olive Thorne Miller; "Nannette Goes to Visit Her Grandmother," by Josephine Scribner Gates; five volumes of The Riverside Uplift Series, including "The Cultivated Man," by Charles W. Eliot; "The Amateur Spirit," by Bliss Perry, and three books by George Herbert Palmer, "Self-Cultivation in English," "The Glory of the Imperfect," and "Trades and Professions." Three Hart, Schaffner & Marx prize essays in economics, which will also be ready, are "The Canadian Iron and Steel Industry," by W. J. A. Donald; "The Tin-Plate Industry," by Donald Earl Dunbar, and "Means and Methods of Agricultural Education," by Albert Leake. "The Song of the Lark," by Willa Sibert Cather, will be published in October.

The American-Scandinavian Foundation announces for publication two new volumes of the Scandinavian Classics for 1915, as follows: "Poems and Songs," by Björnstjerne Björnson, translated from the Norwegian, in the original metres, with an introduction and notes, by Arthur Hubbell Palmer, and "Master Olof," by August Strindberg, translated from the Swedish, with an introduction, by Edwin Björkman.

"The Life, Diary, and Letters of Oscar Lovell Shafter," Associate Justice, Supreme Court of California, January 1, 1864, to December 31, 1868, has just been issued in a privately printed edition as a daughter's tribute to her father's memory, by Emma Shafter Howard.

To the publications of the Dramatic Museum of Columbia University will be added in October a second series on acting, viz.: "The Illusion of the First Time in Acting," by William Gillette, with an introduction by George Arliss; "Art and the Actor," by Constant Coquelin, translated by Abby Langdon Alger, with an introduction by Henry James; "Mrs. Siddons as Lady Macbeth and Queen Katherine," by H. C. Fleeming Jenkin, with an introduction by Brander Matthews; and "Reflexions on Acting," by Talma, with an introduction by Sir Henry Irving and a review by H. C. Fleeming Jenkin. A third series is in preparation to be issued in the autumn of 1916. It will contain the following four papers on play-making: "A Stage Play," by Sir William Schenck Gilbert, with an introduction by William Archer; "Discussions of the Drama," by Carlo Goldoni, selected, translated, and introduced by Hobart C. Chatfield-Taylor; "Theatrical Table-Talk," by J. W. von Goethe, selected, translated, and introduced by William W. Lawrence; "How Plays are Written," by Abraham Dreyfus, translated by H. H. Hughes, with an introduction by Brander Matthews.

Mr. Dunbar Rowland, director of the Mississippi Department of Archives and History, is editing for publication the official letter-books of William C. C. Claiborne, as Governor of Mississippi Territory, as Commissioner of the United States to receive the Province of Louisiana from the French Government, as Governor-General of the Province of Louisiana, as Governor of the Territory of Orleans, and as Governor of the State of Louisiana, embracing the years 1801-1816.

Amid the roar of shells and bombs it is cheering to learn that certain studies "gang their auld gait," namely, the Publications of the [London] Philological Society. Quite as if there were no war, the Society has issued two volumes of decided value for students of English: "A Fifteenth Century Courtesy Book," edited by R. W. Chambers, together with "Two Fifteenth Century Franciscan Rules," edited by W. W. Seton; and "Lowland Scotch as Spoken in the Lower Strathearn District of Perthshire," by Sir James Wilson, with Foreword by W. A. Craigie. The contents of these two volumes are too technical for appreciation in the *Nation*. But the accompanying Presidential Address, delivered by Prof. W. P. Ker on May 7, is abundantly suited to our columns. In ten brief pages Professor Ker, with light but sure touch, brings out anew the singular personality of Jacob Grimm. The founder of German philology was, first and foremost, a *man* whom we can all afford to love and venerate. Professor Ker is absolutely just in his remark: "Philology with Jacob Grimm was part of a study to which I think he gives no particular name. It was history, it was Germany, it was the Middle Ages, the Humanities, Nature, the Human Race." Again: "Modern scholars, who dibble in small patches of Grimm's garden, may often be horrified at the courage of their founder; where he cannot find information, he goes on without it." Was it not Grimm who said that in wrestling with some problems one must even have the courage to fail? Still again: "Grimm's large additions to positive science seem at times like the result of chance. They come as a precipitate from the most extraordinary vague vapor of ideas—a strange enthusiastic religion, the worship of an imaginary golden age." Yes, Grimm was a genius, no lover of "schools"; whereas too many of his followers, especially in these days, are mere schoolmen, prone *jurare in verba magistri*. The few passages of Grimm's German quoted in the Address move the present writer to a fervent ejaculation. Will no one lay bare to American students the wonderful vigor and charm of Grimm's style? It speaks, not from brain to brain, but rather from heart to heart. Professor Ker mentions Grimm's good fortune as librarian to King Jerome at Wilhelmshöhe (Cassel): "He had the lightest of duties and plenty of time for his own reading." Fifty years later another eminent scholar, Grein, who did so much for the editing of Anglo-Saxon texts, was also librarian in Cassel, for the restored Electorate, and enjoyed "the lightest of duties and plenty of time for his own" editing. To the present writer Grein lamented deeply, in 1872, his transfer by the Prussian Government to Marburg. Even Prussian "efficiency," we note, may not be truly efficient. Professor Ker's Address may be had separately for one shilling.

Mr. Frank Harris has patronized a number of the great men of the earth, and now, from the memory of these condescending moments, writes a volume of "Contemporary Portraits" (Mitchell Kennerley; $3.50). Renan sits at his feet and craves his critical commendation; praise is doled out ironically to the silly Frenchman, and the report ends with these words: "But it was not worth while to try to correct his illimitable conceit." Whistler reserved his best witticisms for the ear of Mr. Harris; Oscar Wilde depended on him; Sir Richard Burton poured out to him the secrets of his heart; Matthew Arnold sought advice from him, and so on. But the most astonishing admission in the book is the fact that Browning snubbed

him—not that Mr. Harris uses such a word of himself; he attributes his failure with Browning to "the poor, clouded mirror" of his, the interviewer's, soul, and to other such elegant modesties, but to the reader it looks a little as if Browning had accomplished the impossible and snubbed him. Mr. Harris confesses in his Introduction that he writes from memory, and cares more for "spiritual divination" than for "verbal accuracy," and the reader rather regrets that his divinatory art failed him when he came to write of Browning, for one must do Mr. Harris the justice to say that his divination is at least more entertaining than his veracity. Perhaps we do Mr. Harris a wrong in this delicate matter, but there are times when the lack of accuracy in his report seems to be more serious than verbal. Is it really true, for instance, that Carlyle whined quite so mawkishly to this Mr. Harris over the woes of his married life? Is it really decent—we waive the question of veracity—to publish to the world a confession of Carlyle's about himself, which sounds, at least, like a clumsy revival of the Jewsbury-Froude scandal? That story ought to have been silenced once for all by Andrew Lang's statement of the facts told him by Mrs. Carlyle's physician. Mr. Harris threatens further disclosures on this unsavory topic at another time. Some friend from among the humble ranks of gentlemen ought to hint to him that he has said enough.

Mr. Harris attempts criticism in statecraft and literature, as well as portraiture. He scolds England for neglecting her geniuses, particularly for not placing Sir Richard Burton at the head of Egypt. He does not seem to understand that a good colonial governor is scarcely to be looked for in a genius who, according to this friend's account, was a scholar of "pornographic" taste and "infernal pedantry," and a man of "untamed appetites," who died of gluttony. He liked Burton for these things, but poor Matthew Arnold's decency apparently stung him to impotent fury. "Snobbish and vicious nonsense" is one of the pretty phrases he hurls at the dead critic. But something too much of Mr. Harris. It is a pity he could not eliminate himself from his portraits.

Little, Brown are putting out a number of booklets known as the Mind and Health series ($1 each), which, according to the advertisement, are "written by eminent specialists and edited by H. Addington Bruce, and designed to present the results of recent research and clinical experience in a form intelligible to the lay public and medical profession." "Sleep and Sleeplessness," by the editor of the series, is now ready, as are also Dr. I. H. Coriat's "The Meaning of Dreams" and Dr. J. J. Putnam's "Human Motives." Mr. Bruce has given a clear, simple, and brief account of the nature of sleep, the causes of dreams, nightmare, and somnambulism, and the proper treatment of insomnia. It is in his treatment of the latter subject that his book will be most useful, through its appeal to the sufferer to discard drugs and set himself to work at a systematic effort to get control of his own consciousness. In the earlier part of the work perhaps too much appeal is made to the latest results of modern science, and one gains the impression that the importance of monotony in inducing sleep and the fact that physical stimuli often produce dreams are "important discoveries that have been made during recent years through psychological investigation." Readers of Mr. Bruce's previous writings will not be surprised to learn that, in explaining the various phenomena of sleep and dreams, the subconscious is worked for all it is worth. If the subconscious plays a prominent part in "Sleep and Sleeplessness," it is the leading and almost the only actor in "The Meaning of Dreams." For Dr. Coriat has swallowed Freud entire, and his book might be described as a popular and expurgated summary of the "Traumdeutung." That it is expurgated is certainly a blessing, and it may safely be used as a textbook in a young ladies' seminary. But most of the Freudian machinery has been preserved, and the "lay public and medical profession" can here learn all they need to know about those mysterious powers and mechanisms which, as Freud has discovered, determine our dreams—"the foreconscious," "latent content," "displacement," "secondary elaboration," "the censor," and the rest. All these wonderful things are propounded as the solid results of an established science, with no hint that they are in any way subject to question—for has not Freud spoken? As say the Schoolmen, *Philosophus dixit*. The unsophisticated reader will wonder at many of the dream interpretations, and still more at the conclusions deduced, and he may be astonished even at the Freudian commonplace that all dreams, including the most distressing, are to be explained solely as the fulfilment of a wish. But he will learn that all difficulties vanish before the technique of psycho-analysis, with its various "mechanisms" and its agile use of symbols—as is admirably illustrated in many of Dr. Coriat's examples, in one of which, for instance, the dream of a brother's death by hanging is interpreted as the expression of the dreamer's wish not to die of cancer, while in another a beard is taken to symbolize "a better knowledge of internal medicine." With such free and skilful use of symbolism as this it is not difficult for a master of the psycho-analytic technique to force any and every dream under the Freudian formula.

Dr. Putnam's book on "Human Motives" is a rather perplexing combination of the "Psycho-analytic Movement" with an attempt to prove the existence of God. The first chapter opens promisingly, pointing out the fact that most of our acts are from motives which we only half understand, and whose roots extend backward and outward quite beyond our ken. These motives "are mainly traceable to the conjoined action of two different and apparently antagonistic sets of tendencies," namely, our rational aspirations and ideals, on the one hand, and, on the other, our inherited instincts and emotional repressions. It is in the discussion of the first of these that the author is led into the long philosophical disquisition which fills the second chapter, and which reminds the reader strongly of the Cartesian argument for the existence of God. From the sublime it is but a step to Freud, whose views are accepted with admiration after being somewhat softened down. Farther on there is an analysis of motives, which, though sound, adds nothing of importance to our knowledge, and certainly owes very little to the psycho-analytic method. The lessons of this recently discovered method are applied, in a separate chapter, to the practical matters of the rearing and education of children—a chapter which, though fairly long and carefully written, contains little that has not been the common property of wise parents and teachers since the days of Noah. Doubtless it is true that the parent should encourage his child to talk confidentially, but not to talk too much; that the teacher should make his influence count with his pupil, but not as too strong a factor; that the child "should neither be flattered nor too much persuaded, nor too much indulged, nor too much dominated." But fortunately the world did not have to wait for Freud and the psycho-analytic method before learning some of these things. In spite of which fact, this chapter on Educational Bearings is, in the reviewer's opinion, the most important chapter in the book. For it makes plain the fact that "the results of recent research and clinical experience," while certainly important for the medical profession in dealing with abnormal cases, do not throw such a flood of light on the affairs of every-day life as the advertisements of this and similar series of books on popular psychology would lead the eager reader to expect.

A certain melancholy attaches to the publication of the second series of three essays on "Germany in the Nineteenth Century" (Longmans, Green; $1.25 net). Undertaken by the University of Manchester as a friendly eirenicon to dispel the cloud of English suspicion by the spread of sound knowledge regarding Germany, the first series met with considerable success. Then the war intervened to frustrate the hopes with which the enterprise had been put forth. The editors, however, have wisely deemed that a refusal to continue the work might give rise to misconception. The studies in the second series are printed as they were originally written, without any attempt to recast judgment in the light of the war. Dr. A. S. Peake writes on the "History of Theology," beginning with Schleiermacher and ending with Ritschl, the two most important influences on German theology in the nineteenth century. Strauss, Baur, and the other rationalists who intervene also receive adequate attention. The system of Ritschl, according to Dr. Peake, was designed to meet the widespread lapse from faith by interpreting Christianity in a way acceptable to the modern mind. Ritschl emphasized the uniqueness of Christianity and the impossibility of understanding it except from the inside. It is surprising that the writer has not made more of Ritschl's indebtedness to Lotze in the matter of "judgments of value" *(Werturteile)* and of his kinship with certain modern modes of thought, whether known as pragmatism, Bergsonism, or what not.

The section on "The History of Philosophy," by Dr. Bosanquet, is almost too condensed for a sufficiently full understanding. The writer wishes merely to convey some impression of the main direction of philosophic growth. His own inclination is to the triple rhythm—creation, disintegration, recovery; that is to say, he believes that philosophic study is working towards a future metaphysic; but as this point is disputed in Germany, he is content to divide the century roughly into three periods: post-Kantian (*i. e.*, Hegelian), neo-Kantian, and the contemporary period, which is eclectic, but in which

there is at least renewed talk of preparation for a metaphysic. "The History of Music," by F. Bonavia, deals only with the symphony and the opera, the two main achievements of the first and second halves of the century, respectively. There is no discussion of chamber-music or of the song. The symphony, according to this writer, is a form peculiarly suited to the German temperament, as it demands, besides inventive genius and imagination, a sense of order and a power of organization—qualities in which Germans have ever excelled. The nine symphonies of Beethoven placed Germany highest among all the musical nations, and the operas of Wagner have maintained her there. The possibility that the sceptre may be passing to other peoples (for example, the Russians) is not discussed. The commendable purpose and excellent tone of these articles make the slovenly spelling of the German words all the more regrettable.

In "India and the War" (Doran; $1 net), Lord Sydenham, late Governor of Bombay, contributes a sketch of Indian history for a book chiefly valuable for the excellent illustrations it contains of the various units comprising the British Indian Army. Where ethnic and religious differences play so important a part in the welter of races of the Indian Empire, a classification of this kind is useful if aided by careful and discriminating artists. In the case of this little book the artists are observant of even the subtle differences that distinguish the uniform of one regiment from another. Scattered throughout these pictures of the troops are photographs of the leading native princes, many of whom are now at the front in personal command of the units they loyally offered. Including a résumé of opinion among native leaders regarding the war, the book offers appendices containing Lord Crewe's speech as Secretary of State for India, accepting the unanimous offer of India through the Viceroy to take part in the struggle, a message from King George, excerpts from the Indian press, and the Army Order of Gen. Willcocks welcoming the Indian troops on their arrival at the front. Curiously enough there is no mention in the book of the numbers sent by India, which we know to amount to 70,000 picked troops with their accessories: India has pledged herself to maintain this number despite the losses entailed by the war. A more pertinent criticism, however, is necessary. It is a pity that the opportunity offered in a book of this nature was not taken to elucidate the manner of fighting for which each race and regiment in the Indian army is, by custom and habit, noted. Since the entrance of these troops into the European theatre we have already become conversant with the *kukri* of the Gurkhas; much could have been made of the peculiar qualifications that divide the various races into their natural aptitudes as cavalry, infantry, and scouts, as well as of their methods of offence and their predilections for their native weapons.

To the literature of the land problem Sir Thomas P. Whittaker has contributed a most serviceable volume, "The Ownership, Tenure, and Taxation of Land" (Macmillan; $3.75). Without pretending to original research, the author has brought together from many sources—historical, legal, and economic—a large collection of facts and principles, and has then presented "the proper conclusions to be drawn from them." His purpose has been to provide for the general reader, long since lost in the mass of accumulated controversial literature, a convenient handbook and guide. This he has successfully accomplished. Against the historical, legal, and economic absurdities of the land reformers, whether land nationalizationists or single-taxers, he arrays an impressive mass of evidence which cannot fail to carry great weight with every fair-minded reader. Particularly useful are his quotations from the reformers themselves on the real purpose of their proposals, which in ordinary discussion is seldom stated obtrusively. Useful, too, in enforcing understanding of these matters is the reproduction (p. 209) of passages like that in which Henry George argues for repudiation of public debts. If the book does nothing else, it should clear up the grotesque misconception of historical facts contained in Cobden's celebrated speech of 1845, in which he sought to show that the land of England had been gradually relieved from almost all taxation. The author's own opinions are eminently sane and sensible. He sees both sides of the shield, he treats opposing views fairly, and he makes a distinct contribution to the better understanding of a difficult question.

"The Political Science of John Adams," by Correa Moylan Walsh (Putnam; $2.25 net), is the first detailed and critical study that has been made of the political philosophy of a statesman who has been acclaimed, on the one hand, as the foremost constitutional lawyer of the American Revolution, and held up, on the other, as the most extreme embodiment of all that was narrow and provincial in the early Federalism. Adams's career as a political thinker falls into three fairly well marked periods. The first, from 1765 to 1786, embraces his practical activities in the achievement of independence and the organization of State governments, upon the latter of which, however, his influence was only indirect. Here he acquiesced in, though he did not accept, the Jeffersonian theory of political equality. The second period saw the publication of his most considerable work, the "Defence of the Constitutions of Government of the United States," called out by Turgot's criticism of the first State Constitutions and advocacy of a unicameral system; his "Three Letters to Roger Sherman" and "Discourses on Davila," and his "Correspondence with Samuel Adams on the Subject of Government," written in 1790, but not published until 1802. In the third period, with public life behind him, the extreme views which had helped to make him unpopular were modified, and the political system of the States and the nation was accepted as it stood. The burden of Adams's criticism of American government was directed against the notion that all men are created equal, and the embodiment of that idea in a popular government of a pure democratic type. The best legislature, as he conceived it, was one so constituted as to recognize the natural division of society into an aristocracy and a democracy; while the executive should spring from the legislature and be non-partisan. The model, of course, was the British Constitution, and Adams did not hesitate to urge the advantages of an hereditary governing class, and of political distinctions based upon family and wealth. He feared the influence of election upon the character of the Senate and the Executive, at the same time that he apprehended the growth of extreme aristocracy in the Senate. Hence his interest in "checks and balances" as a means of restraining the ambitions of either department of the Government. The wonder is that a man with such essentially monarchical sympathies could ever have attained the Presidency. In a final chapter, the author urges that the Senate, the real object of which is to check democracy, should be made over into a council, which, shorn of much of its independent legislative power, would exert a mediating influence upon executive, legislature, and judiciary alike.

Science

GASTRONOMY IN AMERICA.

Bohemian San Francisco. By Clarence E. Edwords. San Francisco: Paul Elder & Co. $1.25 net.

The School Kitchen Textbook. By Mary J. Lincoln. Boston: Little, Brown & Co. 60 cents net.

The Nutrition of a Household. By Edwin Tenney Brewster and Lilian Brewster. Boston: Houghton Mifflin Co. $1 net.

The Small-Family Cook Book. By Mary Denson Pretlow. New York: McBride, Nast & Co. 75 cents net.

Baltimore, New Orleans, and San Francisco are the three American cities most widely famed among epicures. Baltimore owes its preëminence largely to the fact that Chesapeake Bay provides terrapin, canvas-back ducks, and other delicacies in their perfection. In New Orleans the local flavor is due to Creole influences, while San Francisco owes its distinction as a gastronomic centre to a variety of causes, which are entertainingly described in Dr. Clarence E. Edwords's volume, the full title of which is "Bohemian San Francisco: Its Restaurants and Their Most Famous Recipes." There are hundreds of these restaurants, and, as in Paris, each of them specializes in some particular dish. The author's reminiscences go back far beyond the great fire (being a San Franciscan, he never says earthquake), and while he sadly admits that some things are not what they were before the destruction and rebuilding of the city, there are still abundant reasons why San Franciscans, away from home, "always want to get back to where they can get something to eat." They miss both the delicacy and the variety of flavors which the Italian, French, German, Mexican, and Oriental cooks in California impart to their dishes.

Dr. Edwords takes his readers in turn to the representative restaurants of each nationality, not merely the expensive ones, but the humbler kinds, in which often one gets tastier food for much less money. He also serves as guide to the fascinating fish and vegetable markets, in some of which the best and freshest food materials are sold at prices which explain why some of the

restaurants can give such good meals for so little money (for instance, a table d'hôte dinner of six or seven courses for 25 cents). The Italians lead along this line, and the author's remarks on their eating-places, sources of supply, and methods of cooking constitute the most entertaining of his pages, and the most valuable of them, too; for, surely, in these days of high cost of living, it is important to know why and how these foreigners in California "live twice as well as the average American family, at half the cost." These people "have studied gastronomy as a science, and they have imparted their knowledge to San Francisco." Nor do they depend much on importations of foodstuffs. Even their macaroni is made in California, and the much relished "Italian" ham comes from Virginia. In the last analysis, however, supremacy lies in this: that "there are two things that an Italian demands in eating, and they are fresh fish and fresh vegetables." For fish-eaters, San Francisco is a paradise; the variety of seafood is astonishing. The crawfish is brought from Portland, and from the South comes the abalone, which, whatever may be said about its toughness, makes an even better soup than the bird's-nests served in the Chinese restaurants, concerning which the author also has a good deal to say. With so much to choose from, and so much that is tempting, is it a wonder that all San Franciscans have adopted the Bohemian fashion of dining out a great deal, especially on Saturdays and Sundays?

Other American cities are beginning to wake up to the fact that "the preparation of food is something more than a necessary evil." Eloquent evidence as to this general gastronomic awakening is to be found in "The School Kitchen Textbook" of Mary J. Lincoln. When the first version of this admirable book was written, some thirty years ago, instruction in cooking in the public schools of America was in the experimental stage, the only work which had been done being in a Boston schoolroom under philanthropic management. There were practically no schools for the training of teachers of cookery, and the literature of the subject was almost non-existent. To-day, public instruction in cooking is given in thousands of schools; there are special colleges for the training of teachers of domestic science, and books on the subject are appearing in ever-increasing numbers. Mrs. Lincoln's volume is not a revision of her "Boston School Kitchen Textbook"; it is a new treatise, embodying the results of the latest investigations and research; and while it has for its subtitle "Lessons in Cooking and Domestic Science for the Use of Elementary Schools," it would be difficult to name another volume equally useful to the thousands who have to learn the art of cooking without the aid of a teacher. Some things there are which only personal experience can teach, such as the amount of heat required for baking and other ways of cooking; yet the two pages concerned with the subject (258-9) in this book contain invaluable hints. The art of making a fire is discussed; there are pages on fireless cookers, ventilation of the kitchen, sweeping, dusting, dishwashing, laying the table, table manners, kitchen equipment, care of food, canning and preserving, as well as the best methods of cooking different viands, with plenty of recipes—in short, girls who learn all these things, in school or out, are in a fair way of becoming model housewives. Lucky husbands of the future!

More might have been said about the mineral matter in various foods and the importance of flavor as a guide to correct cooking. The subject of electric cooking is most inadequately disposed of in nine lines. These things will receive more attention in the next edition, no doubt, as will the list of books to be consulted by students, which is surprisingly incomplete. The subject of calories is also slighted, but that is no fault, too much attention having been given to it by recent writers, among them the authors of the third book on our list, "The Nutrition of a Household." Not only do they harp perpetually on calories in the body of the book, but there is an appendix of forty pages filled with tables of percentages of various nutrients. The writers, nevertheless, are frank enough to admit that "appetite and judgment are usually better guides than chemistry and arithmetic." They admit, further, that no eater of foodstuffs can possibly keep track of a dozen amino-acids and another dozen inorganic salts needed for a well-balanced dietary; and they add, sensibly: "The most that Science can advise, practically, is the shotgun method—a sufficient variety to make sure that, one thing with another, it covers all the ground. We limit the range of our foods at our peril." In view of the fact that lions devouring flesh, boars grubbing for roots, moose consuming leaves, and gorillas living on fruit are all equally strong, it is argued that all foodstuffs are equally good, in their place. The assertion that "there is no such thing as a fattening food" is not proved in these pages, nor are a number of other paradoxical statements which in some cases are contradictory. This book, on the whole, seems undigested, but there are a number of sensible and clever sayings in it, such as "cooking is part of the digestion"—an elemental truth overlooked by most Americans.

"The Small-Family Cook Book" does not differ materially from a hundred other useful kitchen manuals which methodically give recipes for the preparing of soups, meats, vegetables, salads, breads, and desserts. The measures given are for families of two or three persons. A few recipes are added of dishes most relished by Germans, and there are twenty pages of "Old Virginia Recipes," in which the assertion is made that, in Tide-Water Virginia, hams are always boiled, never baked. The author is so convinced—and with good reason—of the inferiority of our Western cornmeal to the Southern white water-ground meal, that she hesitated to include recipes made of cornmeal, because you can't make them unless you have the right meal.

Drama

MARIE TEMPEST AT THE LYCEUM.

Miss Tempest, like Miss Maude Adams, is a person of mannerisms. If you like them, they enrich and blend with her art, of which she has her due portion. But those who do not find these mannerisms attractive are apt to remember them too insistently and to begrudge her art the credit which it deserves. Piquancy, the basis of most of the rôles in which she has recently appeared, need not of necessity be jerky and precipitate. To gauge its possibilities one has only to think of various successful representations of Shakespearean heroines, from whom this quality is seldom absent. But if Miss Tempest's acting lacks reserve and quietness, it has personality always.

In the double bill in which she is to be seen at the Lyceum Theatre, she has plays evidently much to her liking. Robert Marshall's "Duke of Killicrankie," a drama not unknown to New York in the past, is one of those artificial creations which depend for their success upon substantial acting of the old-fashioned sort; it is a comedy of manners worked into situations the outcome of which is never for a moment in doubt. The Duke of Killicrankie, a young man of large estates, having met with obdurate refusal in the repeated advances he has made to Lady Henrietta, has decided to exhibit in heroic measure the determination which he has been accused of lacking, and so, by a vigorous pulling of wires, virtually incarcerates Lady Henrietta with himself, a friend of his, and the lady beloved of this friend in his castle in Scotland. Is it any wonder that Lady Henrietta and Mrs. Mulholland, when freed, decide to imprison themselves for life by marrying the two bold suitors?

Miss Tempest, taking the part of Mrs. Mulholland, the widow of a rich glue-manufacturer, has a chance to match wit against the usual outgivings of a lady of assured position. The part might have been played in several ways, but Miss Tempest's vigorous procedure held the audience and gave enjoyment. The parts of the two male performers were admirably filled by W. Graham Browne and Ferdinand Gottschalk.

Barrie's "Rosalind," a trifle comparable to his "Little Mary," is, for the most part, a dialogue between an actress (Miss Tempest) and a young Oxford graduate, who comes upon her during a summer vacation and fancies he is in love with this woman's daughter—for so much does "make-up" account! This is the playwright's central idea, yet he has left openings for tears as well as laughter. The lad's disillusionment, and the actress's, too, when she realizes how much she has aged by a mere change of costume, furnish moments for sober thought. On the whole, the comedy was played with the desired flourish and sprightliness, both by Miss Tempest and Mr. Denny. F.

"OUR CHILDREN."

Theatregoers who are particularly anxious for a play devoid of sex or shrapnel and are in a rocking-chair mood will find considerable gentle pleasure at this comedy in three acts by Louis K. Anspacher. The plot discloses the results of spoiling a son and bullying a daughter. Willybad Engel, a rich German shoe-manu-

facturer, gives Theodore everything he asks for, and drives from the house the devoted Hertha when she insists on marrying the foreman, Richard Hellman. The boy, a weakling, is ruined by speculation. He flies from the house to avoid the police, taking with him money belonging to his fiancée, a banker's daughter for whom he has thrown over a humbler sweetheart. Willybad's business is injured by strikes and his rivals are aided by Hellman's inventions. In the last act he is back at his workbench, a cobbler again. He now appreciates his daughter, yet refuses to see Hellman, who has secretly paid off Theodore's debts. But Christmas is come and all hearts are open for the reconciliation that includes Theodore's return to his first love.

The author has centred the interest in the characters rather than in the action. As this treatment of a theme is all too rare on Broadway these days, it is greatly to be regretted that he has not divided his attention in better proportion, and that he has given up so much of his priceless two hours to lines that have no value whatever. Several persons of importance are but faintly drawn; the qualities of others are needlessly reiterated. But it was the transparency of the scenes and speeches that made the audience inattentive; and that despite some very good acting. Emmett Corrigan supplied plenty of intelligence and force for the long rôle of "Uncle Willy." The most artistic performance was that of Albert Bruning as the old friend, "Stasi." The important part of the son—a type that has had several brilliant representations in the past—fell to Ralph Morgan. His hard work was unfortunately marred by sharp, jerky movements and diction, but the scene when he prepared for flight was very well played. In Spencer Hutton a new character was introduced to our stage—the bank president with a halo. In most of his speeches, however, Arthur Lewis threw a sop to tradition by assuming a sneaky look. Alphonz Ethier, as Hellman, was so good in his brief denunciation of Willybad that we wanted to see him tackle the old man again. B.

Music

LETTERS OF A FAMOUS VIOLINIST.

Letters from and to Joseph Joachim. Selected and translated by Nora Bickley. New York: The Macmillan Co. $3.75 net.

Two years ago the letters written by and to the famous violinist, Joseph Joachim, were collected by his son and his biographer, Andreas Moser, and published in three large volumes, containing considerably over a thousand, although they did not include the correspondence with Brahms, which had been previously issued as the fifth and sixth volumes of Brahms's "Briefwechsel." As this includes 500 letters, Norah Bickley had, therefore, more than 1,500 to choose from when she decided to select and translate sufficient specimens of the correspondence of Joachim to make one volume in English. She has executed her task judiciously, making excellent translations of notes and epistles, most of which were evidently written without any idea that they would ever appear in print.

Joachim was for several decades at the head of the Joachim Quartet, probably the most famous organization of its kind the world has seen, and reputed unequalled, at least in the performance of the chamber music of Haydn, Mozart, Beethoven, and Brahms. As a solo violinist he was, moreover, held to be an unrivalled interpreter of the sonatas and concertos of the same masters; nor was this all. As director of the Royal Academy of Music in Berlin he had opportunity to wield an influence second to that of no contemporary teacher. Like all modern players, he travelled a great deal, and in all these ways he came into contact with most of the distinguished musicians of his time. In turning over the pages of his correspondence one constantly comes across such names as Brahms, Liszt, Wagner, Schumann, Berlioz, Franz, Bargiel, Stephen Heller, Stanford, Max Bruch, etc., as writers or recipients.

It is a little surprising to find so few letters in this volume from or to English friends, for, like Handel and Mendelssohn, Joachim was esteemed in England perhaps even more than in Germany. The Brahms cult in England, which is now abating, was due more to his preaching and practice than to that of any other musician, and by his many appearances at the "Popular Concerts" he helped to inure the public at large to the strain of listening to serious music. In a preface to this volume, Mr. Fuller-Maitland expresses the opinion that Joachim's influence on the music of his time was great beyond all possibility of assessment; but this is a gross exaggeration. Apart from Brahms and Schumann, there was no neglected master for whom this violinist did missionary work. Even the romantic and prophetically modern Schubert was for a long time beyond the range of his limited sympathies, and the modern schools of composers, headed by Wagner and Liszt, he fought savagely to the end of his career.

Liszt was the object of his fiercest hatred, notwithstanding the fact that this master had lavished on him in his early career the same generous aid he gave to all who came to him. Readers of the letter dated August 27, 1857, in which Joachim tells Liszt how "entirely antagonistic" that master's music was to his ideals, will pronounce it frank or brutal, according to their sympathies. How far Joachim subsequently went in his aversion to Liszt is instanced in another letter, dated 1870, in which he tells Brahms (another of the conspirators against the "modern clique") that he has refused to take part in a projected Beethoven festival because Liszt had been chosen to conduct the "Missa Solemnis"! Well-informed musicians know that Liszt inaugurated almost as great and salutary a revolution in orchestral and choral conducting as in piano-playing; but to Joachim this invitation was a "flippant comedy"! Wagner, to be sure, considered Liszt the greatest of all interpreters of Beethoven, but in the opinion of Joachim Wagner was not much better than Liszt. He found something touching in the way Hans von Bülow "sacrifices himself to Liszt and Wagner; it is a pity his good qualities cannot find a better channel for his enthusiasm." Joachim had absolutely no capacity for enjoying Wagner's operas, finding even "Die Meistersinger" a bore. For this he cannot be blamed; it was a matter of taste; but it was something different which, in 1870, made him write to Clara Schumann that, in his honest opinion, she "should on no account take part in a concert at which Wagner is conducting." That such a man should have been, until a few years ago, director of the leading German high school of music seems odd. It must have cost him a pang to write, in 1893, concerning his own daughter: "She went from here to Bayreuth to study some parts with Frau Cosima; for, of course, like all operatic singers, she is under the spell of Wagner's creations. It is no good opposing this nowadays."

Joachim's dearest friends were Robert and Clara Schumann and Brahms. Mme. Schumann's letters are the most interesting of all in this volume. She was a bundle of violent prejudices, and there is reason to believe that she had a good deal to do with turning Joachim against his former friend and benefactor, Liszt; but when she writes about her great husband, or her own pianistic tours and tribulations, she always holds the attention. The same cannot be said of the letters contributed by Brahms. Twenty-five of them are included, and most of them are dull. "I am no letter-writer," he says in one of them, and he was right. In his letters, as well as in those of Joachim and Clara Schumann, there are echoes of a temporary estrangement between Brahms and the other two. "Brahms is egoism incarnate," Joachim writes, and Mme. Schumann bears witness that sometimes he "made life with him almost unbearable." They seem to have had a good deal of trouble, too, in persuading Brahms to keep up his piano practice, so that he would do himself justice when playing in public. Of this playing Joachim had a high opinion, but what he says about it bears out what Wagner and others maintained: that it was dryly intellectual, without a trace of feeling. It is amusingly characteristic of Joachim himself that he admires Brahms's playing because it is "so light and clear, so cold and indifferent to passion"! It has always been held that those composers and authors are the greatest who give the deepest expression to the joys and woes of mankind; but Joachim evidently thinks he is paying Brahms another compliment when he adds: "His compositions, too, are an easy treatment of the most difficult forms—so pregnant, rejecting all earthly sorrows with such indifference."

Concerning Joachim's own efforts at composition some interesting details may be found in this correspondence. He sent his overture to "Hamlet" to Liszt, dedicating it to him and expecting him to perform it. Liszt was kind enough to praise it, and to encourage the young man along this line; but the audiences were less tolerant. To Bargiel, who urged him to have his compo-

sitions performed in Berlin, he wrote: "The manner in which they have been received in Düsseldorf, Weimar, Leipzig, and Cologne gives me no reason to suspect that my compositions would be sympathetically received in Berlin." However, he consoled himself after the fashion of his friend Brahms, who, when his first piano concerto was, to cite his own words, "a brilliant and decisive failure" in Leipzig, being even hissed, although he himself was at the piano, wrote to Joachim: "I believe this is the best thing that could happen to one; it forces one to concentrate one's thoughts and increases one's courage. After all, I am only experimenting and feeling my way as yet."

HENRY T. FINCK.

Finance

OUR MARKETS, AND BELLIGERENT EUROPE.

Throughout the recent period of reaction from the high hopes of reaching a permanent understanding with Germany, whereby the outrages of her submarine campaign should be abandoned, the Stock Exchange has refused to express alarm. International houses expressed, in the private conversation of their members, grave doubts as to the outcome of the Dumba episode and the latest German communication on the Arabic; but the investment markets continued unruffled. This attitude undoubtedly embodied the conviction that, while Germany is the foremost military Power of the day, and England the foremost naval Power, the United States is the foremost Power in international finance, and that Germany is well aware of it. Germany, it is further assumed, is no less aware that, while her own military prestige still remains to be finally tested, the naval predominance of England in the war is unchallenged, and the financial predominance of the United States is acknowledged by all the world.

This happens, moreover, at the very moment when all the belligerent states are considering very seriously how they can go on raising money to conduct the war on its present scale, and where they will get the money to reconstruct their own affairs when war is over. Berlin has shown signs of understanding that the way to prepare for these coming problems is not through forcing a breach of all friendly relations with the Power which holds the key to the financial situation.

There appears to be little doubt in the American financial mind that the responsible heads of government at Berlin recognized this phase of our own situation in their recent efforts at coming to terms with our State Department on the submarine controversy. It was undoubtedly a matter of perplexing conjecture, to Wall Street as to every one else, what had happened at Berlin to cause the virtual *volte-face* in last week's communication on the Arabic. There are those who will suggest that a family resemblance exists between the German Government's defence of the submarine commander, because he "became convinced that the steamer had the intention of attacking him," and the same Government's labored explanations, thirteen months ago, that German armies were invading Belgium because they were "convinced" that the French armies "had the intention" of doing so.

Both excuses smack of a General Staff, rather than of a serious Foreign Office; they might mean that von Tirpitz is shaping German policy to-day where Bethmann-Hollweg was shaping it two weeks ago. All this was necessarily conjecture. But it did not alter the underlying fact, made perfectly plain in the letter sent to our Government through Count Bernstorff, that the German Government, if the army and navy cabal is once eliminated as a controlling influence, does not wish and will not provoke a breach with the United States.

This increasing strength of the American economic position continues to be enhanced, even in the face of the negotiations for a $500,000,000 loan to the French and English markets, by the extraordinary movement of gold to the United States—a movement whose significance will not have escaped the attention of the German financiers and Government. In the case of each of the three large blocks of gold, received by New York from London during the past five weeks and amounting to $19,500,000 apiece, no notice of their shipment from England was given, and the Bank of England's weekly reports showed no sign that any of the gold thus sent had been obtained from its vaults. Last Monday, however, the cables reported $11,900,000 gold withdrawn from the Bank for export to New York. This would seem to mean that the share in the movement allotted to the Bank of France and the London joint-stock banks had been for the time performed, and that the Bank of England was called upon to do its part.

The New York bank statement of Saturday, with its report of cash holdings $100,000,000 above what they were at the end of May—only fifteen weeks ago—gave one reflection of this extraordinary westward flow of gold. The statement of the Federal Reserve banks provides another. The gold reserve of these institutions now stands $18,000,000 above that of July 1 and $53,000,000 above January 1. Yet the increase in their rediscounts, for the year to date, has been only $32,000,000, and the increase in note circulation $13,000,000. Facilities of the new banking system for sustaining local credits or providing for movement of the crops have as yet been virtually untouched. The movement of European gold into our markets continues on a scale which seems still further to postpone the need of any large application of its machinery—which nevertheless remains as a further potential element of strength, when the financial resources of the country are called on to help repair the economic waste of Europe.

PUBLISHERS OF THE UNPOPULAR REVIEW

A TEXT BOOK OF THE WAR

FOR AMERICANS

By J. Wm. White, M.D., Ph.D., LL.D.

"It is undoubtedly the most effective compilation of facts, quotations, and citations yet contributed to the vast literature on this subject. As an effective argument, it is a cross between the 42-centimeter cannon and the French 75—tremendously destructive like the former, and smooth in action like the latter." —*Ex-Attorney-General James M. Beck.*

ECONOMIC ASPECTS OF THE WAR

Neutral Rights, Belligerent Claims and American Commerce, in the Years 1914-1915

By EDWIN J. CLAPP.

Professor of Economics, New York University.

This book, the first authoritative work showing the actual effect of this country of the great European struggle, discloses how international lawlessness affects America, as a type of the neutral nations of the world.

It is non-partisan in tone, though impartial and severe in its condemnation of the belligerent actions that have brought about the present situation. While intended for the general reader, the book preserves the scientific spirit necessary to judgment on the great questions involved.

The Nation

NEW YORK, THURSDAY, SEPTEMBER 23, 1915.

Summary of the News

An official memorandum of the German Government on the sinking of the Hesperian was received by Secretary Lansing from Ambassador Gerard on September 16. The text of the memorandum has not been made public, but it is understood that the German Government denies explicitly that the Hesperian was attacked by a torpedo, basing this statement on the explanation that all the German submarines that were out on the day the Hesperian was damaged have been heard from and that none of them was in the vicinity of the disaster on that day. The memorandum suggests the probability that the explosion was caused by a mine. The British official Press Bureau, on Monday, issued a statement reaffirming the affidavit of the Hesperian's officers that the ship was torpedoed. A German submarine, it is asserted, was in the neighborhood in which the Hesperian was attacked on the day in question, since ships were sunk to the north and south of this spot on September 4 and 5, and it is further stated that a fair-sized fragment of a torpedo, which was picked up on board the ship before she sank, is now in possession of the British Admiralty.

No further progress towards a settlement of the submarine issue has been recorded during the past week, nor is any definite news expected for some days. It is generally believed that the German Ambassador, Count von Bernstorff, has received from his Government more ample powers to arrange the matter through informal conversations, and that there will be no further exchange of notes on the subject between Washington and Berlin. Dispatches of the Associated Press from Berlin on September 18 stated that a long report on the situation had been received from Count Bernstorff on Thursday of last week, and that instructions had been sent to him empowering him to negotiate terms of settlement subject only to final revision by his home Government.

Less fortunate than his German colleague, Dr. Dumba has become reluctantly convinced that his usefulness either to his Government or to those "white slaves," his "poor, oppressed fellow-countrymen," is definitely at an end. The Austrian Ambassador has admitted that tentative reservations have been made for him to sail on the Holland-America liner Rotterdam on September 28. The general opinion of the press appears to be that Dr. Dumba has not augmented his reputation for diplomatic sagacity by a curiously disingenuous note of explanation and defence addressed to Secretary Lansing under date of September 17, the text of which was published in Sunday's papers.

The long-delayed decision of the British Prize Court in regard to various American cargoes, principally of meat, shipped, for the most part, by the great American packing companies, was delivered on September 16, the British court condemning the greater part of the American products. Leave to appeal was given. Comment on this decision will be found in our editorial columns. The action of the British Prize Court will not, it is understood, materially affect or modify the tenor of the forthcoming note to Great Britain, dealing with interference with American trade and the operation of the Order in Council. Secretary Lansing announced on September 17 that this note was finally completed and was ready for dispatch to Ambassador Page in London.

Discussions between American bankers and the Anglo-French financial commission on the subject of a credit for the Allies proceeded all last week. Early in the present week it was announced that an agreement had been reached as to the general principles of the credit, and, as we write, there appears to be every prospect that minor problems will be successfully solved. The main points agreed upon are understood to be: that the loan shall be from $500,000,000 to $800,000,000, bearing interest at 5 per cent.; that its duration shall be from five to ten years; that it shall be underwritten by a syndicate of American bankers; that the notes shall be sold to the public at par and the underwriting syndicate shall receive one-half of one per cent. for its services.

Announcement was made on September 17 of the recognition by the United States of the Government of President Dartiguenave of Hayti. An earlier announcement stated that the projected treaty between Hayti and the United States had been signed on the previous day. The terms of the treaty, which is for ten years, give to the United States a financial protectorate over the republic.

An important decision in regard to the Mexican situation was reached by the Pan-American Conference on Saturday of last week, when it was determined that a *de facto* government in Mexico should receive the recognition of the United States and of the A B C Powers within a period of three weeks. The government to be recognized will be the one which, in the opinion of the Powers represented at the Conference, is the strongest both physically and morally. The decision of the Conference is generally taken as foreshadowing a recognition of Carranza.

The past week has seen a considerable lull in the activity of German submarines. Only two vessels, one Norwegian and one British, have been reported sunk since we wrote last week.

Events in the Balkans appear to be approaching a crisis, although the situation is, as we write, if anything more obscure than ever. The Allied Powers last week addressed a further note to Bulgaria requesting a reply as to that country's future intentions in view of the concession of territory in Macedonia which Servia has announced her readiness to make. The note was not in the nature of an ultimatum, but it is understood that Premier Radoslavoff was verbally informed that an early reply was expected. So far, Bulgaria's only answer has been to order the mobilization of troops in the Macedonian territory offered but not yet ceded to her. Dispatches on Tuesday announced that the Government had ordered the mobilization of all the military forces of Bulgaria, for the purpose of "armed neutrality."

Attention continues to be concentrated upon the German campaign in Poland. Vilna was abandoned by the Russian army defending it at the end of last week, and fears were entertained lest the army should be encircled. As we write, however, German efforts to pierce the Russian line at Slonim have so far been unsuccessful, the railway south of Lida is still in Russian hands, and there appears to be a good prospect of the army that defended Vilna escaping the envelopment that von Hindenburg had planned. In the west the fighting has been principally confined to violent artillery duels. In Flanders the land forces of the Allies have been assisted by the British fleet. At the apex of the German wedge at St. Mihiel, shells from the French artillery have cut the "great bridge" across the Meuse River which formed one line of the German communications. The long projected attack on Servia has apparently commenced: dispatches on Monday and Tuesday spoke of German artillery coöperating with Austrian in bombarding the Servian positions on the Danube.

Reginald McKenna, Chancellor of the Exchequer, in his budget speech in the House of Commons on Tuesday, estimated that the Government's revenue for the current year would be £272,000,000, that the expenditure would reach £1,590,000,000, and that the dead weight of debt at the close of the financial year would be £2,200,000,000. Among other means of raising revenue, the Chancellor proposed an addition of 40 per cent. to the existing income tax, and the reduction of the minimum of taxable income from £160 to £130.

In England the question of conscription continues to be debated with ever increasing heat and to the accompaniment of rumors of irreconcilable dissensions in the Cabinet and of governmental crises. That Lord Northcliffe has done his country most lamentable disservice by his persistence in putting the question on a controversial plane is obvious, and it seems equally apparent that, as a result of charges, almost certainly exaggerated, by the *Daily News*, of conscriptionist plots and intrigues to disrupt the Cabinet, many of Northcliffe's supporters are "running for cover." A frank statement on the matter, which should go far towards removing the question from the fog of controversy in which it has become obscured, was made in an open letter by Mr. Lloyd George, issued by the official Press Bureau on September 19. In the House of Commons on Thursday of last week James Henry Thomas, a labor member, warned his hearers that the introduction of conscription would be followed by a strike of the Railway Union.

The New York *Times* last Saturday published an account by Vilhjalmur Stefansson of the discovery he has made of new land in the Arctic. Dispatches announcing these discoveries contained the first news of the explorer since April 7, 1914.

The Week

Not in anger, but in pained astonishment at the ways of republican diplomacy, does Austria-Hungary's Ambassador Extraordinary take leave of our shores. "If," he writes in his remarkable letter to Secretary Lansing—

> If the conveying of letters to Europe by Americans travelling abroad during the war is an offence, it is one of which most Americans are apparently ignorant, as the courtesy has frequently been volunteered by my friends, and is habitually practiced. It did not for a moment occur to me that it was improper, nor am I yet able to see it in that light, having regard to the entirely legitimate purposes I had in mind in the line of the performance of my duty.

How does that casual reference to "my friends" fit Dr. Dumba's description of the particular American who carried the fatal letter for him? "To-day at twelve o'clock," he wrote in that letter, "Mr. Archibald, who is well known to your Excellency, leaves on the Rotterdam for Berlin and Vienna. I would like to use this rare, safe opportunity——" But the messenger was no rarer than the message, with its allusion to "the preparation of disturbances" in American factories. Yet this is characterized in Ambassador Dumba's letter as "the entirely legitimate purposes I had in mind." The most striking feature of the whole affair, however, is that the only diplomatic move that has caused President Wilson to take drastic action has been made by the representative of the most punctilious court in Europe. The one unmistakable error thus far committed in this country by an Ambassador of the warring nations must be charged against precedent-loving Vienna.

The subject for discussion being Germany, Count Bernstorff, and the Arabic note, the *National Zeitung* rises to remark:

> The promise [Count Bernstorff's] and the note [Germany's note on the Arabic] are two entirely different things. Count Bernstorff could not possibly have known that the Arabic intended to ram the submarine which sank her.

When we have reassured ourselves that the *National Zeitung* is not a comic weekly, but a supposed organ of opinion, and that it probably intends what it says to be taken seriously, we can only stand aghast before this resurgence of an extraordinary phase of German mentality. Count Bernstorff's promise and Germany's violation of his promise have nothing to do with each other! The German Ambasador's assurance of complete satisfaction and the German Government's refusal of satisfaction in the Arabic note, with its curt, goose-step phraseology, have nothing to do with each other! No wonder Berlin is hopeful regarding the situation. Berlin, as interpreted by its newspapers, has no objection to an arrangement by which von Bernstorff shall concede general principles and von Tirpitz shall file 100 per cent. of exceptions. Read not only the *National Zeitung*, but the other *Zeitungs* and *Anzeigers*, and you get the impression that the United States is engaged in a desperate attempt to placate Germany, which is inclined to be generous. Is the Berlin press really ignorant of the fact that the present situation is virtually one in which a German Ambassador is desperately engaged in persuading his Government not to go back on his solemn pledge delivered under authority at a moment of crisis?

We do not know whether the intimation from Washington, that the German Government would protest against a loan by our markets to the English and French Governments, is meant to be taken seriously. But of one thing we are sure—that the "protest" itself, based on allegations that such a loan would be "unneutral," would be taken seriously by nobody. By consulting the files of the New York newspapers at the opening of April, any one may discover the public advertisement, to the American investing community, of $10,000,000 Imperial German Government 5 per cent. Treasury notes, which were to be paid, interest and capital, in American gold coin at New York. These notes are publicly quoted to-day in Wall Street; nobody interfered with the marketing of them. Perhaps the German Government might answer that the announcement of its note issue in April declared that proceeds "are to be used only for the establishment of commercial credits in the United States," whereas the proposed Anglo-French loan would pay for munitions of war. That contention would invite three answers: First, our Government has already declared exports of munitions to be legitimate commercial business. Secondly, the credits raised by France and England would be applied to purchases of grain and cotton as well as to manufactured goods. Thirdly, public advertisements in the second week in March, by New York bankers, offered to take subscriptions in the United States for the second Imperial German war loan, floated at Berlin, and there were subscriptions to it.

It is possibly because of knowledge of these facts that some individuals appear to have started a propaganda, designed to incite pro-German depositors in American banks to threaten those institutions in case of their participation in the Anglo-French loan. We do not expect any tangible results from such an undertaking; partly because a bank president who could be deterred by such threats from a perfectly legitimate investment would thereby make public confession of his unfitness for his responsibilities, but partly also because an organized conspiracy such as is hinted at, to induce depositors to "run" on the banks in retaliation, would be a perilous business for its organizers. Mr. Herman Ridder, whose knowledge of international finance seems to be as profound as his knowledge of international law, adopts yet another policy. He tells us in his daily monologues that "the money of America is in the hands of one man, and he is at the moment in the hands of the Anglo-French commission"; that the "British and French Governments have sent to us experts to dictate our financial policy" (a somewhat original diagnosis of the situation), and that the British Government is planning to "take the money out of the pocket of the cotton farmer," and use it for the war. Somehow these oracular sayings remind us of similar utterances on another platform, which at the time caused a weary smile, especially among German-Americans. Can it be that Mr. Ridder never discovered the Money Trust until he had also discovered Perfidious Albion in the market?

Senator La Follette joins the distinguished group that already includes two such economic and legal authorities as William J. Bryan and J. Hamilton Lewis and that has taken unto itself the special protection of our neutrality. When the Wisconsin Senator sees something doing in Wall Street, he lifts up his voice if he is in the Senate Chamber or on the Chautauqua platform; in vacation time he reaches for his pen. This is vacation time, and so you must buy the current number of *La Follette's Weekly* if you want to learn the whole truth. But even a part of it is bad enough. We are not surprised to find that Morgan and "our money interests" generally are engaging once more in the unholy business of lending money at the highest rate of interest they can squeeze out of the poor borrowers, but it is sad to have to include persons outside of Wall Street in the terrible condemnation of violating our neutrality. Allied with Morgan and our money interests in this con-

spiracy are Schwab and our manufacturing interests. As the Senator pointedly remarks, not only by every principle of good morals, but even under the criminal code, he who supplies the weapon, knowing that it will be used to kill, is equally guilty with the slayer. And the proper time to reverse the practice of supplying weapons is in the midst of a fight. In what other way than by thus suddenly throwing whichever party may happen to be profiting more from that practice upon his own resources could you give him so clear a demonstration of real neutrality?

Viscount Bryce's appeal on behalf of the Armenians accuses the Turkish Government of forming deliberately and carrying out systematically a plan for extirpating all Christians of Armenian race. It was not local frenzy, aided by the irresponsibility or indifference of the central Government, but direct orders from Constantinople that resulted in massacres like that at Trebizond. One cannot help feeling that so terrible a charge is probably exaggerated. The Turkish Government has been quite capable of embarking upon a policy of wide terrorization, and it is all too likely that in certain districts this was carried to an extreme of cruelty; but even the Sublime Porte could hardly descend to the depths of inhumanity necessary in decreeing the stamping out of Christianity by the killing of all Christians. Yet even if its initiative in the dreadful scenes reported in Armenia was not so great as Viscount Bryce believes, he is quite right in believing that the moral opinion of the American nation, exerted directly or through Turkey's Teutonic allies, is the one outside force that has a chance of stopping the destruction. Indeed, action taken by Ambassador Morgenthau might be more effective than the appeal of neutral sentiment to Berlin. He was reported last week as having suggested to Turkey a plan for the rescue of the Armenians through an American fund. A full statement from him or from semi-official sources as to the exact situation in Asia Minor would instantly mould public opinion, and if the case is as dark as it is painted, he could command the fullest support in sentiment and in funds.

One of the reasons for the failure of Austro-Italian negotiations last spring was Austria's stipulation that the territory which she was willing to cede should pass only after the conclusion of hostilities. Italy had its doubts about the value of a bare promise. Teutonic diplomacy seems to have taken the Italian point of view when the promise is a Turkish promise. Bulgaria must not wait for her price. Without lifting a finger, she has won a sizable strip of territory and a free way for her railway line to Dedeaghatch and the Ægean. The transfer is now being conducted amicably at Adrianople. And yet it was not long ago that Premier Radaslavoff declared that if the Allies said the word, a Bulgarian army of 250,000 would start for Constantinople. There is, of course, no illusion in any quarter regarding the nature of the bargain just completed. On neither side is there any love lost. Let Servia and Greece pay the price, and the present benevolent neutrality of Bulgaria to the central Powers would disappear. The Bulgars make no pretence about it. The present is their opportunity. Moreover, what would otherwise be international blackmail is very considerably mitigated in their case by the fact that three years ago they were themselves the victim of a "hold-up" by Rumania. The territory which Bulgaria now receives from the Turk is only a fraction of what she asserts should have been her legitimate reward after the first Balkan War.

"Not far short of three millions," is Mr. Asquith's estimate of the enlistments in the English army and navy since the beginning of hostilities. Deduct the navy enlistments, and two and three-quarter million recruits are the apparent minimum for the new armies. The Army Establishment before the outbreak of the war was placed in the Parliamentary estimates at 727,000 men, but allowance should be made for the Territorials, where the ranks were not filled up. If we say half a million we are safe. Canada has at the front or in training about 150,000 men. Australasia has sent about 50,000 men. Indian native troops probably have been brought to the same number. This would make three and a half million men as the total of the Empire's forces, old and new. The casualties, as we learned the other day, have been 382,000, of whom 100,000 have probably returned for duty. Subtracting roughly 300,000 for casualties, we get 3,200,000 men in the field or drilling. At the front in the west, if we add to Lord Lansdowne's estimate of last July Lord Kitchener's twelve new divisions, we get about 700,000 men. In Gallipoli there can hardly be more than 150,000 British troops. Altogether at the front there are thus much less than a million. Waiting for active service are about two and a quarter millions. Of these at least a million have had nine months' training. The inference, therefore, is that Great Britain is still prevented by lack of equipment from making full use of her numerical strength.

The prorogation of the Duma for a period of two months is the Czar's reply to the demands formulated by the Liberal majority in Russia's "parliament" for political and social reforms as the necessary condition for a full rallying of the nation's forces against the enemy. Berlin would be justified if it included the dismissal of the Duma in the list of German successes reported on the eastern front. By breaking with the representatives of the people the Czar has struck a blow at the cause of the Allies. The Russia that must now confront the Kaiser's advancing armies is no longer united. The forces of revolution have been manifesting themselves under the sting of military disaster. The forces of revolution will now be strengthened by Liberal disaffection. In the Duma, a few days ago, Miliukoff, leader of the strongest Liberal faction, protesting against the rumors of prorogation, uttered words that sound ominously like Mirabeau's in the States-General. If we are sent away, said Miliukoff, we shall be back in a few weeks and in a different temper. Simultaneously with the dismissal of the Duma comes the news of measures taken for the repression of popular demonstrations in the large cities. It is like an echo of 1905. Even while Kitchener and Asquith were speaking of Russia's magnificent stand against the common enemy, the Czar decided to challenge his own subjects. The effect on public opinion in the west will be deplorable. It is certainly no benefit to the Allies to have the possibility arise that munitions for Russia may yet mean munitions against the Russian people.

Hayti has followed the example of her sister republic, and we are now to show what we can do in the way of straightening out the finances of another turbulent state. The announcement that the treaty was signed at Washington last Thursday is followed by the expectation of its ratification by the Haytian Congress shortly, the session having been prolonged for the purpose of considering such agreement as might be arrived at by the representatives of the two Governments. We anticipated this event by recognition of the new Haytian Government. The treaty establishes a Hay-

tian receivership of customs under our control and a native constabulary force also under our control, and gives us the management of Haytian finances generally to the extent that may be necessary to safeguard the interests of the Haytian people—all this for a period of ten years. Those immediately concerned with the arrangement are hopeful that this "financial protectorate" will pull Hayti out of the slough of both domestic and foreign difficulties, at least in so far as those difficulties are due to financial mismanagement.

For political candor, commend us to Victor Murdock, of Kansas and the National Progressive party. If the Colonel thinks he sees a chance to win in 1916, he will accept another nomination from the party. If there must be another sacrifice, his strong inclination will be to stand aside and allow some one else to take the beating. If, then, the Colonel displays no unusual coyness during the Presidential primaries, we may infer that in his opinion the party has been revived. On the other hand, if he waves the nomination aside and murmurs "Johnson," the country will know that it is all over and that the wicked are once more about to occupy the seats of the mighty. But along with his candor, the Progressive Chairman has other qualities more typical of men in his position. He gives no indication of suspecting that the Colonel might come out for the Republican nominee, leaving the Progressives to shift for themselves. He is also able to speak of "the chance that the Republican party will nominate William Howard Taft," and to do this with a perfectly straight face. Nor has he any information that would lead him to suppose that there is the slightest likelihood that the Republicans and the Progressives will be found voting together next year. "The 1912 campaign proved that there are 4,000,000 people who do not believe in the fetich of a party label. Once broken away from the old party, they will always be independent." What the campaign of 1914 proved he does not deign to notice.

But Mr. Murdock's real vision is of a split in the Democratic party. An "internal explosion" he calls it, and he foresees it happening in Congress before the fourth of next March. "The young men of the party have tired of the game and the way it is played by the older men," he discovers, "and these young men are bound to cause a blow-up that will lay the Democratic party flat within the next six months." Here the Kansas prophet stands upon firm ground. Everybody remembers the dissatisfaction among the young men of the party in 1912 over the outcome of the Baltimore Convention, with its backward-looking candidate and its failure to displace the aged McCombs by a more youthful National Chairman. All history, moreover, confirms Murdock's forecast of a party dividing as it sees an election approaching. Differences assume exaggerated importance, factions push conflicting programmes, Congress discusses and passes a mass of momentous measures, after which it breaks up in a row. Especially does the majority party air all its internal troubles at such a time. Murdock has been in Congress, and he knows what happens during the period immediately preceding the National Convention season. The only thing which he omitted to mention was the bitter rivalry for the Democratic nomination, which promises a split, no matter who wins the prize. What gives special force to this fine dream is the dreamer's detached attitude, as shown in his admonition to his fellow-Progressives: "Give the people the idea that we can win, and we will have to enlarge our bandwagon."

Already murmurs of apprehensions are heard as to the workings of the confused sets of new Presidential preference primary laws; and we find one New England journal predicting that a candidate with Mr. Roosevelt's energy may be able to "muss up" the forthcoming Conventions with contests over delegates, as at Chicago in 1912. Certainly, next year we shall begin watching operation of the laws in seventeen States in about seventeen different ways. The tendency of all is to bind the delegates either too much or too little; to insist in some States that even if the preferred candidate becomes hopeless, they shall continue voting for him, and in others to let them, under such a contingency, cast their instructions to the winds and vote for whom they please. A more rational plan would be to instruct delegates in first, second, and third choices. But the diversity of preference laws in minor points is startling. Note the caution of Indiana, in insisting that all candidates for Vice-Presidential or Presidential nomination shall pay a fee of $100 to the State. Note the suspicion of Illinois, in providing that if a Presidential candidate whiffs deals and treachery, he may disavow a delegate who has declared for him and appoint some one else. There is plenty of room for contests and confusion. But the cost of squabbles is so great, both as regards the dignity of the Convention and the harmony of the party, that all sides will surely try to avoid duplication of the scenes that attended the Republican gathering of the last campaign.

The statement in the news dispatches that John D. Rockefeller, jr., is to spend a considerable time in the Colorado mine fields, is interesting; it may be extremely important. Without belittling on the one hand the degree to which the labor unions, and especially unscrupulous persons among their leadership, were responsible for wantonly murderous acts and incitements, or on the other hand aggressions and negligence on the part of the operating corporations, we feel that one of the most serious factors in the civil strife which disgraced the State of Colorado lay in the fact that Mr. Rockefeller, most conspicuous if not most influential in the ownership, was dependent for his information upon distant representatives whose statements, however honest, must perforce have been *ex parte*. The opportunity before him now is one of great potentialities. If he contents himself with a merely superficial hearing at first hand, on the ground, of what he already has been told by mail and telegraph, his visit will be of little value or significance. If with a deep sense of the responsibility with which fortune has clothed him he devotes himself to a real study of the large problem that besets that sadly troubled country, he may do an enormously important thing for his fellowmen.

Aside from the gratification which will be universal, in the confidence that Vilhjalmur Stefansson, the explorer, whose death in the Arctic wilderness has seemed a foregone conclusion, is safe after all, one cannot resist the thought of what will be his state of mind when he first hears news of the world. For more than a year and a half he has been out of reach of tidings of any human happening beyond his own horizon of ice and ocean. Since he passed, in April, 1914, beyond the ken of his fellow-men, the whole world has plunged deep into the chaos of bloodshed and destruction unprecedented. When he left there was no visible portent of the turmoil which has covered the earth with woe. It may be doubted whether in all the world there is one other individual for whom is in store so staggering a shock as awaits this man in his first instalment of news from "civilization."

NEUTRAL RIGHTS AT SEA.

The action of the British Prize Court condemning some millions of dollars' worth of American cargoes seized on their way to neutral ports has naturally produced an unpleasant impression in this country. That the right to detain or confiscate cargoes of this nature has been stretched by the British beyond established precedent has seemed plain all along; and it has seemed fairly clear that it has been stretched beyond the limits which a change in conditions might properly be held to justify. The reasons for the Prize Court's decision, so far as they are to be gathered from the cable dispatches, do not remove this impression. That the case has been so long in reaching a conclusion in the Prize Court is also a substantial grievance; though any very hot indignation on that score would come a little oddly from a nation so notoriously slow as ours has generally been in the settlement of judicial questions. The case will now be appealed to the Privy Council by American shippers, and if that appeal should fail, there is no doubt that the interposition of our State Department by diplomatic means will be invoked. In the meanwhile, our Government will certainly have set forth its views on the whole question of the treatment of American trade under the British war policy, upon which the President and Secretary of State have so long been contemplating the making of a strong representation to the British Government.

So far as can be judged from the information in hand, both as regards the grounds of the decision of the British Prize Court and as regards the view taken of the subject at Washington, the London decision is not likely in any serious degree to complicate or aggravate the situation, at least in the immediate future. The matter is not so simple as some comments on the subject appear to assume. Whatever highhandedness there may be in the Orders in Council, or in the British claim as to the scope of the blockade, it is not upon either of these that the confiscation of the American cargoes is based. The question appears essentially to turn on the treatment of conditional contraband. And even here a distinction has to be made—the distinction between the question of how such contraband is to be dealt with when the facts are as charged by the British Government in this case and the question of the way in which the charge is to be established. In the judgment delivered by Sir Samuel T. Evans, president of the British Prize Court, the element of misrepresentation or deception on the part of the shippers is particularly stressed, and it would be rash to say to what extent the conjuncture of this element with their refusal to accept the burden of proof that the goods were not specifically destined for the enemy forces should be regarded as justifying the action of the Court.

In saying these things we are by no means desirous of belittling the importance of the question at issue between this country and Great Britain on the subject of American trade to neutral ports. To prevent encroachment upon the rights of commerce which have in the past been enjoyed by neutral nations in time of war, is the clear duty of our Government. It is important on account of its bearings upon the immediate economic interests of our people, upon the future of international commerce in general, and upon the maintenance of a just attitude towards the rights of the nations opposed to Great Britain in the present war. That this duty, however, will be performed with vigor and ability by the President and Secretary of State, we have no doubt. We are not unmindful that time is of the essence of the matter, and that much time has gone by without effective action following up our initial announcements of policy in this regard. But nothing can be plainer than that this delay on the part of our Government must be ascribed to the situation in which we have been placed by the unspeakable lawlessness and barbarism of the policy with which Germany identified herself when she sank the Lusitania, and from the burden of which she has not yet emancipated herself. It must be remembered that the mere announcement of this policy of lawlessness, last February, did not interfere with our making a protest against the British Orders in Council just as clear and emphatic as the protest we made against the German programme. It was only when that programme was translated into action which shocked the conscience of the civilized world that the efforts of this country in relation to Britain were halted.

Between the issue precipitated by the Lusitania massacre and the issue that turns upon British violations of neutral rights at sea, the difference is usually said to be that the issue with Germany involves the protection of American lives, while that with England relates only to property rights. That difference undoubtedly looms largest in the general mind, and also affects most plainly the state of feeling that prevails in official circles. But this difference by no means covers the case. American lives could, for the future at least, be safeguarded by Americans abandoning the right to sail the seas in time of war; the bottom fact in the case is that, unlike matters relating to contraband, or blockade, this right is so simple and elementary, and has been so wholly free from challenge for generations, that to violate it strikes at the very root of international faith, and to defend it without reserve or qualification is a prime duty of national self-respect. In the matter of blockade, in the matter of seizure of contraband, we ourselves stretched the pre-existing understandings of international law during our Civil War; if England has now stretched them more, and stretched them with less justification, that is a ground for very determined objection on our part, but it is not a new thing under the sun. If von Tirpitz's policy of frightfulness, besides failing of its object as to British commerce, has had the effect of paralyzing for a time such interposition of this country in favor of neutral commerce as would have inured to Germany's advantage, nothing could be a better example of poetic justice.

TOWARDS PEACE IN MEXICO.

Until October 9, Pancho Villa is to have an opportunity to show cause why the Government of Venustiano Carranza should not be recognized as the legal Government of Mexico. That is the plain purport of the policy formulated at the meeting of the Pan-American conferrees in New York city on Saturday, and given to the public by Secretary Lansing. Anticipating the criticism that this action is an abandonment of the policy formulated in the "get-together" note of August 15, addressed to the factional leaders in Mexico, Mr. Lansing's statement is at pains to show that we have here not an abandonment of policy, but a fulfilment. We are told now that the signatories of the note of August 15 foresaw the possible failure of the appeal for harmony, and had therefore agreed upon the recognition, as an alternative, of that faction which showed itself best able to fulfil the elementary functions of government—the protection of life and property and the ultimate establishment of social order. Could any other alternative have been contemplated by the conferrees? It must be confessed that the August note did arouse in the public mind the possibility of intervention. Not enough attention was paid to the statement issued at that

time by the Ambassador of Argentina that his Government could not associate itself with a plan for the restoration of Mexican order by force. To-day we have the assurance that this principle was accepted by the members of the conference, that at no time was intervention in Mexico contemplated.

The note of August 15, now explained as the necessary preliminary step towards the recognition of a Mexican Government, was something more than that. It was a move on the part of the Pan-American associates to gain time. Military events in Mexico were moving so rapidly that a delay of five weeks was pretty sure to clarify the situation. In five weeks Pancho Villa might show whether he could turn the tide of battle that was swiftly running against him. By a dramatic victory he might yet put Carranza in a position where the tenacious old gentleman would be willing to discuss compromise. No such victory has been forthcoming. Since the August note was issued, Durango and Saltillo have fallen to Carranza, and the sweep of Obregon's armies northward has continued. The Sunday newspapers, along with the action of the conference at the Hotel Biltmore, printed authentic news of the abandonment of Torreón by the Villistas. The collapse of organized resistance to Carranza is seemingly a matter of weeks. It has been foreshadowed in the action of this Government in recalling its citizens from Villa's territory. In another three weeks Chihuahua, the last of Villa's strongholds, may be in Carranza's hands, or its fate, at any rate, be pretty definitely determined. The associated American Governments are then to exercise their individual judgment in extending recognition. This is theory. In practice we have no doubt that the Pan-American conferrees will act as one.

From the point of view of mere fitness to rule, Venustiano Carranza has stood out for many months as the best man in Mexico. We say that with full recognition of those defects of temper which have so sorely tried the patience and good will of the Administration. The very qualities of doggedness, of insistence on what he considered his rights and the rights of Mexico, have shown Carranza possessed of the elements of the "strong man" for whom the situation seemingly calls. As between Carranza and Villa there have all along been in favor of the former the facts that he was the original leader of the revolution against the assassins of Madero, and that he represented enough of the old Mexico in prestige, education, and general capacities to make the transition much easier than it would be to a ruler of the type of Villa or Zapata. These abstract qualifications have been reinforced by the very important concrete fact of victory in the field. The stories of Obregon's turning against Carranza soon proved to be fabrications. Carranza has held the loyalty of his commanders, both in crisis and in victory. He has shown fortitude and patience. He has been a very good patient waiter on his own account. He waited for months in obscurity during the war against Huerta until the legend spread that there was no such person as Carranza. He has waited doggedly at Vera Cruz. He has demonstrated that with him in the palace at Mexico City there could be no unseen government, no play of sinister forces, such as would attend installation of the illiterate and tempestuous Villa. If any man in Mexico carries in his own person the promise of a permanent settlement, it is Carranza.

When, therefore, the time comes for the extension of recognition to Carranza—and that, it is hoped, will not be long postponed—Washington will be doing something much more than taking a leap in the dark, as disgruntled critics are saying to-day. Only in a specious sense will it amount to letting Mexico continue to fight out the issue for herself. It is no longer a question of fighting to see who is the best man, but of final clearing-up operations before the best man has accomplished his task. This end cannot but be hastened by recognition from Washington. If Carranza's cause has moved forward so prosperously all these months when Washington was supposed to look askance at his cause—and with fair justification—his ultimate triumph must be accelerated by the formal expression of our goodwill. With Washington on record, the interests on this side of the border which have been speculating on Villa will refuse to continue in what must become a desperate gamble.

Nor would such favorable action by Washington be anything but a logical development and fulfilment of our policy of patient waiting. There will be enough critics of Mr. Wilson to say that even if the solution does come we shall have merely stumbled into it. But to the historian who looks back on the Mexican revolution since the death of Madero, our policy will show consistency and strength. We shall not have muddled through, but in a very real sense shall have waited through, and that not passively. The historian will recognize that at critical moments we have intervened for the good of democracy and order in Mexico. Every revolution has two phases, the tearing down and the building up. We helped in the removal of Huerta, as the survivor of the old régime, though at terrible risk to ourselves. We will now help towards the establishment of a new and better state of things by giving our moral support to the one man who embodies the necessary ideals and capacity to bring a new order into being across the Rio Grande.

ENGLAND AND CONSCRIPTION.

When Asquith or Kitchener discusses "compulsory national service," the partisans on either side are still at liberty to read into the speeches what they like. The only people who have apparently made up their minds about conscription are Lord Northcliffe on one side and the labor unions on the other. Lord Northcliffe is to be reckoned with, but he is by no means so important as the labor unions. Last Thursday, the most powerful of the unions, the railway workers, served notice in the House of Commons that conscription would be followed by a general strike. "If the conscriptionists want an industrial revolution," said their Parliamentary representative, "let them proceed with their agitation." This cannot be regarded as an empty threat. The British workers have shown throughout the war that they do not regard the national necessity as pressing enough to justify their surrender of privileges for which they have long struggled, or for the introduction of radical changes which they regard as a menace to the future welfare of their class. The Welsh miners have shown that words would be followed by action. England's allies will not read this latest expression of a very important section of British sentiment with satisfaction. France is preparing to call her boys of eighteen and her men over forty-five to the colors. Russia is calling up her last line of reserves. Paris and Petrograd will be asking more than ever whether England is doing her share.

To what extent is this attitude of the British workers due to indifference? To what extent is it justified by the facts? Unquestionably, one of the factors in the problem is the growing sense of security in England as to the possibility of an invasion of the islands; and, after all, the consciousness that his own country is safe from attack must enter into the average Englishman's estimate of the seriousness of the general

situation, just as it would count with the average Frenchman or Russian or German. Reports agree that the panic fears of the early days of the war have disappeared. The British fleet does hold the seas and bar the way to a hostile force. The military routes into France are adequately protected. Germany's submarine warfare has demonstrated the maximum of its capacity to inflict damage on British trade and the nation's food supply. There are the Zeppelins, to be sure, but these are an irritation rather than a menace. Finally, there is the British army on the Continent. With nearly three-quarters of a million men barring the way to Calais, with surely as many men behind the line available for emergency, the feeling is pretty general in England that the British line is safe, that the road to the Channel coast is closed to the Kaiser, and that the menace of an attack across the narrow waters has been removed.

It would be unjust to the British workers to suppose that they are content with this selfish view of the situation. England's liability must go beyond protecting her own coasts. She must help to win the war for the Allies. It is not a sufficient answer to say that England has done her share, that at the beginning of the war she was pledged to a small expeditionary force, and that she has called up an army of three and a half million men. It is only what England's own interests, as well as her duty to her allies, would dictate. England's liability, the *Manchester Guardian* declared the other day, is not a limited liability. She is engaged in a tremendous issue, and she must put forth every effort necessary to win. The question is not, therefore, whether England has done her share, but whether she has done as much as she could. The answer of the British workers is that she has done so. When men were wanted, the workers, with the rest of the nation, responded. When the problem became one of organization, the workers—so they would contend—equally responded. The labor leaders' pledge of a volunteer army for the munition factories was redeemed in the course of a couple of weeks. Where the unions have made trouble it was because of the suspicion that they were being taken advantage of without cause, that they were called upon for sacrifices which no emergency justified and which would not be effective in any case.

Conscription is one of these unnecessary sacrifices, as the unions see it. And especially conscription in the rather narrow sense which it has taken on in recent discussion. In reply to the argument that the volunteer system has brought virtually as many men to the colors as compulsory service would have done, the conscriptionists have been saying that compulsory service is not so essential for the mere raising of fighting men as for the organization of the war industries. Compulsion is necessary to deal with the shirkers in the ranks of labor, and with the short-sighted policy of some unions in insisting on their rights as against unskilled labor, women workers, the infraction of union hours, and so on. But to say that compulsion would be primarily directed against the workers was naturally to rouse their suspicions to the utmost. It meant the surrender of their liberty of action in order to atone for the errors, the lack of foresight, of the men at the head of affairs. Were the emergency a pressing one, there would be no excuse for hesitation. But there is no grinding emergency. The war is stretching out indefinitely. A decision will be won by endurance. That gives time for the full development of England's strength in accordance with British traditions, not by curtailing democracy, but by negotiating with and educating the democracy to the need of the moment. As the labor unions see the problem, England has raised men for the field without compulsion, and she can obtain munitions for her armies without destroying what many regard as the fundamentals of British liberty.

GERMAN INTENTIONS IN POLAND

Speculation regarding the terms of peace which Germany might look upon with favor, though vague and hazardous at best, has shown a tendency to gravitate towards one general principle which does carry the elements of probability. This is that the Kaiser is now looking to the east for the fruits of victory. As was suggested in these columns some time ago, the military and the moral situation both point in that direction. Of the Allies, it is Russia that has been most decisively beaten and is apparently in the weakest position for a war to the end. In the second place, the opinion of the neutral world would regard with less reluctance any attempt by Germany to recompense herself at the expense of Russia than at the expense of Belgium and France. Assuming that the German line in the west cannot be broken, it is still possible to suppose that the Kaiser would consent to surrender his conquests in the west for various considerations, of which the most important would be the annexation of Russian territory, which must mean primarily Poland. The press in Berlin and Vienna is firm in the assertion that Poland will never again come under the rule of the Czar.

If Poland is lost to the Czar, what is to be its precise fate? The possibilities are three. The conquered territory may be directly annexed, partly by Germany, partly by Austria-Hungary, and ruled as Alsace-Lorraine was ruled until recently. Or a Polish kingdom or kingdoms may be re-created to constitute a member either of the German Empire or of the Hapsburg monarchy, or of both. Or a completely autonomous kingdom may be reëstablished under the protection of the Teutonic Allies and serving its main purpose as an effective barrier to Russian aggression for all the future. The last is the ideal towards which Polish aspirations are undoubtedly directed, but also the one that is plainly impossible of realization. To imagine such a resurrection of Poland, to suggest even, as has been done, that Germany might surrender her present Polish territories, and Austria give up Galicia, to reconstitute the integrity of the old Polish nation, presupposes a degree of altruism not to be looked for in any European capital. The choice apparently is either the entrance of Poland as a constituent member of the Federal German Empire or of the Hapsburg monarchy or of both, or complete annexation.

The probability of an autonomous Poland under some form of Teutonic rule seemed to be greatly strengthened by Bethmann-Hollweg's great speech in the Reichstag on August 19. As quoted in a long dispatch to Sayville on the following day, this is what the German Chancellor said:

> I hope that the present occupation of the eastern Polish frontier means the beginning of a new evolution which will abolish the old-time antagonism between Germans and Poles, and lead Poland, freed from the Russian yoke, towards a brighter future, in which she will cultivate her individual national character.

These words seemed rich in possibilities. They might mean independence; they surely forecast a large measure of Polish autonomy. That Bethmann-Hollweg did not mean independence appears from a sentence omitted in the Associated Press dispatch but reported by the New York *Sun's* correspondent. In the dispatch to the *Sun*, Bethmann-Hollweg prefaced his statement, as just quoted, with the sentence: "I do not imitate the glittering promises of our enemies." No independence, therefore, and no complete autonomy such as Petrograd is supposed to have promised.

How far, then, did Bethmann-Hollweg's individual national life for Poland go?

We find a possible answer in the complete version of Bethmann-Hollweg's speech as printed in the London *Times*. Here again Sayville has omitted a sentence. Bethmann-Hollweg did not stop with the statement about Poland's individual national character. He went on:

> The country occupied by us will be administered by us with the assistance of its own population.

If "administered with the assistance of its own population" refers to the permanent condition of Poland after the war, Polish autonomy, as Berlin sees it, is only a dream.

THE GERMAN DELUSION.

The article contributed by Professor Münsterberg to the magazine section of the New York *Times* of Sunday covers ground so extensive that any attempt to discuss the questions which it raises would require a treatise. But in the main the contentions to which it is devoted fall into two classes. He dwells with emphasis upon the value of certain great qualities of the German people, and implores us almost with tears not to lose sight of their importance; and if this were all, there would be nothing to object to, and a great deal to prize, in his article. Unfortunately, however, this is the very part of the article which has the least relation to any question that now troubles the public mind. Nobody denies to-day, any more than they denied two years ago, that in government, in industry, in education, in science, the Germans are distinguished by an exemplary thoroughness and efficiency from which we in America have much to learn. If the American people have been thinking about the deliberate precipitation of this unspeakably calamitous war, about the violation of Belgium in defiance of sacred obligations, about the systematic atrocities committed by the German forces in that unhappy country, about the unparalleled crime of the Lusitania massacre, rather than about the high attributes which they have always recognized in the German people, this is a manifestation of human nature which a professor of psychology should of all men find it least difficult to understand. We are neither denying nor forgetting what is great and good about Germany; but to ask us to be continually talking and thinking about these things, just as though Germany had been giving us nothing else to think about, is to demand a psychological impossibility.

And this impossibility is intensified by a characteristic of the German propaganda of which Professor Münsterberg himself unconsciously gives a striking illustration in that other part of his article to which we have referred above. The just claims of Germany as a beneficent influence in the world's civilization are fatally obscured by the monstrous exaggeration with which they are constantly being presented by her spokesmen, both at home and in this country. And we do not remember ever to have seen so instructive an example of this as is given us by Professor Münsterberg. A single passage may serve to indicate his state of mind:

> May it not be said that the enmity against Germany which has taken hold of wide circles in America and the resulting war excitement have had no more treacherous effect than the sudden interruption which they brought in the struggle against the spirit of recklessness and lawlessness in the land? The fight against it had begun in many lines. The big crackers on the Fourth were forbidden, steel cars were built and many a grade-crossing abolished, the country-wide movements for the conservation of the national resources began, the work against infant mortality and race suicide, against vice and intemperance, had started, more and more old-age pensions and accident insurance were introduced, the schools were improved, child labor was reduced, some city governments were cleaned. The spirit of carelessness and recklessness was at last threatened by a new spirit of thoroughness and conscientiousness.

Out of the depths of his inner consciousness the professor learns not only that all these good tendencies that he speaks of were derived from Germany, but that they met with a sudden and disastrous check just as soon as our affection for his Fatherland received a chill. Nobody else has heard that we have gone back to the old-fashioned Fourth, that we have stopped building steel cars or abolishing grade-crossings, that our Health Departments no longer care how many babies die, that our city governments are going back to the Tweed pattern, or that the movement against the saloon has been specially languishing since August 1, 1914. The mere possibility of constructing out of nothing such an hallucination as this is sufficient indication of that utter disparity between the facts of the world and the assumptions of German megalomania which has been so conspicuous throughout the German "literature" of the war.

Possibly this ludicrous error may be ascribed to a disturbance of mind natural at a time of war excitement, or perhaps it is even an evidence of a certain American carelessness or want of thoroughness with which the Professor has become infected in spite of himself. But there is a deeper vice in the whole matter, and this is neither American nor specially Münsterbergian, but simply German. With their eyes fixed on their own virtues and superiorities, the Germans have fallen into a way of laying claim to everything good that is to be found in Germany as peculiarly their own, and everything good that is to be found in other countries as a mere reflection of German excellences. That "work against intemperance had started" here as a result of German influences is a novel contribution to history. Even in regard to "vice," it will occur to many as a little startling to have the standards of Berlin held up for the admiration of Americans. No doubt in a few years Dr. Münsterberg will be pointing to the opening of educational opportunities for women as one of the great triumphs of German Kultur; it being, of course, easy enough to prove that the foundation of Vassar College and the institution of co-educational universities throughout the Middle West half a century ago were but the product of some ferment or other that was going on in the Teutonic mind, although it did not show itself in any overt shape until near the beginning of the twentieth century. If the leading commercial city of the United States had had in 1892 such an outbreak of cholera as visited Hamburg and threatened the health of maritime cities throughout the world, that, of course, would have been clear proof of American inferiority and German perfection; but no such inference can be made when it is a German city that is at fault.

A hundred examples could be given of the fallacy of all this self-adoration. Let one suffice. Long before any German city had reached such standards in regard to paving and sanitation as are now looked upon as a matter of course on both sides of the Atlantic, Paris was a miracle of cleanliness and perfection in her streets. We all knew it here, as all the world knew it. But it never occurred to anybody on either side of the water to recommend to the American people a worshipful study of the character or the intellect of the pinchbeck Napoleon to whom the creation of this new Paris was due, or to warn us to remember that an empire built up on false pretence, corruption, and a flashy militarism has its good side, which we might underrate at our peril.

Foreign Correspondence

FINANCIAL AND ECONOMIC MEASURES DEVISED TO MEET THE HUGE COST OF WAR.

By T. L. GILMOUR.

London, August 31.

It is part of the tribute which must be paid to Germany for the thoroughness with which she was organized for war that her preparations were almost as complete on the economic side as on the military. By a curious paradox, the fact that Germany was a debtor nation trading largely on borrowed capital gave her, when war broke out, an immense and immediate advantage over Great Britain and France, and, indeed, almost involved those countries in irremediable disaster. Germany simply did not pay her debts, and so found herself in possession of the goods without having to discharge the obligations which she had incurred. The London discounting houses, on the other hand, found themselves with valueless German paper in their portfolios, and heavy liabilities towards the rest of the world, that must be met if British credit was to be saved from a collapse which, apart from the effect such a collapse would have had on other countries, would have mado it impossible for Great Britain to finance the war.

This is, of course, ancient history, as are the measures which the British Government took on the advice of the leading London bankers, sitting in almost continuous session in those fateful August days a year ago; but it is not inopportune to recall the situation which existed at the outbreak of war, now that it is more clearly recognized than it has ever been that this world-struggle has resolved itself into a contest of endurance in which man-power, brain-power, organizing-power, money-power must all contribute to the ultimate momentous decision. There is evidence that, just as Germany counted on a rapid military success to bring France and Russia to their knees, so she hoped by a crushing initial blow so completely to disorganize the delicate mechanism of British credit that the whole structure of our economic life would be brought down in ruin about our ears.

In her economic, as in her military, forecast, Germany deceived herself. The measures taken by the British Government to grapple with the financial crisis proved, indeed, so efficacious that they obscured the more permanent dangers which the future had in store for us and for our allies. The slogan of the then Chancellor of the Exchequer, "Business as usual," may have had its appropriateness at the moment; but it has long since outlived its usefulness, and to-day everybody whose view is not limited by what is happening beneath his nose recognizes that not only does the war necessitate immediate economic adjustments which are far-reaching and difficult to make, but that greater and even more difficult adjustments in our social, political, and economic organization must follow on the restoration of peace. Superficially, the war has had singularly little effect on London, apart from the darkened streets, the prevalence of khaki, and the blue of the wounded soldiers taking the air in motor-cars and char-à-bancs. Neutral observers tell us that the same superficial absence of change is noticeable in Berlin and in Vienna, but that in Paris it is different. Paris was well within the war zone, and is still so near to it that the Parisians *see* the war. But below the surface London, Berlin, Vienna are as profoundly affected as Paris, though here again, as usual, London is, I think, the last to realize anything either of the character or of the extent of the forces which will ultimately give birth to a new Europe.

So far, I have not met any one in authority who will commit himself to a forecast of what is going to happen to any of us after the war. The general view is: "We've got enough to do to win the war. Let us see to that being done properly. It isn't much use speculating how the incalculable forces that are being called into being will work themselves out. We can't manipulate them. What we've got to do now is to organize ourselves for war." That is a statement which, I think, fairly reflects the public mind; but there are wide differences of opinion as to how our economic forces can be most effectively organized, just as there are widely divergent views as to whether legislative compulsion in some form or another is necessary to the effective utilization of our military resources. So far the actual financing of the war has been effected mainly by voluntary loans raised at home, and to a very small extent by increased taxation. But a very brief consideration of the national finances—not the Government finances—will make it clear that the British public cannot go on lending money to the Government unless it makes very drastic changes in its personal and collective habits. Statisticians are agreed that the national income may be estimated at £2,400,000,000, of which in normal times we spent £2,000,000,000 and had the balance of £400,000,000 for fresh investments, roughly half that amount being invested in home industries and half abroad. Some time ago it was estimated that our annual expenditure during the war is about thirteen hundred million sterling. The estimate to-day would probably be higher. As our estimated revenue is £275,000,000, we have to find, somewhere, in order to balance our budget, about a thousand million sterling.

If a private individual with an income of £2,400 a year, of which he spends £2,000 and invests £400, suddenly finds himself one year engaged in a lawsuit which necessitates his procuring, say, £1,400 in cash, it is obvious that not only will he have no money to invest, but that to raise the £1,000 cash required over his surplus for investment, he must either save the money he wants by curtailing his expenditure, borrow it, or sell some of his securities. It is precisely this predicament in which we as a people find ourselves, and the situation is further complicated by the fact that we have to pay so much of the money we are spending on the war to other countries—principally to the United States—so that the exchange with those countries whose debtors we are has now for some time been going steadily against us. It is astonishing how learned we are all becoming in "foreign exchanges." Not a day too soon the Chancellor of the Exchequer is sending a commission of experts, headed by Sir Edward Holden, the chairman of one of our greatest joint-stock banks, to New York to discuss with the financial experts on your side of the water how the normal relationship between the dollar and the pound may be re-established. That is one aspect only of this many-sided problem, but it is one of primary importance.

Meanwhile the "saving" campaign which the Government started simultaneously with the issue of the last war loan is making some progress, though it cannot, I am afraid, be said to have achieved any great measure of success at present. The whole subject bristles with difficulties. You cannot, Burke said, indict a whole people. Nor can you change the habits of a whole people, even under the pressure of such a world-wide catastrophe as this war. Large classes of the population are reducing their expenditure, because they must do so. Their incomes have either disappeared altogether, have been greatly reduced, or have remained stationary, and prices have risen. On the other hand, many sections of the population have larger incomes than they have ever had before. There has never been so little unemployment. The trades unions have seen to it that the increase in the cost of living has been accompanied by a corresponding increase in the scale of wages. Skilled workmen are receiving wages which many a professional man can only envy. Speaking broadly, there is in progress a very remarkable turnover in the wealth of the country. The rich man is becoming poorer, the poor man is becoming richer. Thousands of workmen are earning six, eight, and even ten pounds a week. The wages bill of one of the largest armament firms is about £280,000 a week. They employ 70,000 men and women, giving an average weekly wage of £4 for each employee. What are these wage-earners doing with their money? The answer is, of course, that, while some are wisely providing against the inevitable rainy day that must come when industry is once more dislocated by the advent of peace, others are spending their unaccustomed wealth recklessly and foolishly, buying, as one of the employers cynically said to me, "sealskin jackets for their wives, and motor-cycles for themselves." To counteract folly of this kind, to stimulate economy, to preach thrift, the Government has established a "War Saving Committee," and various unofficial organizations have been founded with the same object. There is a "War Economy League," with duchesses, marchionesses, and other titled ladies at its head. Its members are to wear a badge and to sign a pledge, or rather a series of pledges, and these may be quoted as typical of what is being done in this direction. The members pledge themselves: "(1.) Imports: To reduce in every way possible expenditure on imported goods, and strictly to limit the purchase of everything that comes under the category of luxuries. (2.) Dress: To buy as few luxurious articles of clothing as possible. To resist all efforts to introduce new fashions. (3.) Motors: To avoid as far as possible the use of motors, except for necessary or charitable purposes. (4.) Food: To give up all unnecessary entertaining, both at home and at restaurants, and to restrict home consumption to the lowest possible limits. (5.) Household expenditure: In no case to employ men servants, unless ineligible for public service. (6.) Influencing friends and dependents: Members must use their influence to inculcate economy among their friends and dependents."

Will these efforts suffice? Already there are suggestions for compulsory saving, either by means of increased taxation or by compulsory loans. And if there is to be increased taxation, will the wage-earners, so many of

whom are in receipt of incomes well over the legal minimum of £160, be brought within the operation of the income tax? That is one of the many knotty problems which the coalition Government has to face.

PARLIAMENTARY DAYS IN FRANCE—*UNION SACREE.*

By STODDARD DEWEY.

PARIS, September 4.

Parliament is taking, until the 16th of the month, a three weeks' vacation, well earned and much needed—by the country at large quite as much as by the members. German newspapers were beginning to print in too big headlines—"French Interior Crisis!" Now there has been no crisis in France, not even the tail of one. And the two latest sessions of Parliament—Friday, the 20th, and Thursday, the 26th of August—were truly Parliamentary days.

Such days presuppose members talking among themselves and to others about what they are going to do and what they are not; also, that they have spoken up to Government beforehand. All this the telegraphic agencies have reported in words which led innocent Germans to believe their heart's desire was soon to be realized. Of course, the proposition to have Parliament resolve itself into a committee of the whole and cross-examine Government in secret session must strike the imagination of foreigners accustomed to non-Parliamentary monarchy as in Germany or to a republic equally un-Parliamentary as in America. The secret session has not been held—by common agreement. The very proposition helped to bring these Parliamentary days for saying the secrets in public.

Another condition of such a day is that the newspapers have been exciting public curiosity about it. Accordingly, every place open to the public was occupied during the debate. And this means that fine Parliamentary oratory was expected, and expectation has not been disappointed.

The first day belonged to War Minister Millerand, who has been the storm-centre all along. He is not an orator in the sense of young American debating societies nor of our Congress in spread-eagle times. He is a thick-set, broad-shouldered figure of a man, wearing spectacles and gray moustaches, with a shock of short-cut upstanding gray hair above a square face. His voice, his glance, and his steady manner are those of lawyers; and a very successful lawyer he has been outside of politics. He hammers his argument very effectively into the hearer's head, however hard. And he faces criticism or attack unflinching and with great directness. It was his very frank and clear discussion of the situation which made the first Parliamentary day.

It does not belong to an outsider to sift the underlying political issues, which are suspected of being little more than politicians' quarrels. The suspicion of a mere political crisis, while the country is engaged in a life-and-death struggle, was violently repudiated on all sides. Deputy Varenne, who with the Jaurès Socialists has been urging most the secret session, answered plainly the ultimate question—Are you going, in the face of the enemy, to cast up the account of our cannon and rifles and ammunition?

"There is no middle way, it is the secret session or silence. If you choose silence, it means—and I shall not complain of it—that war in Parliament corridors is over, and that we think only of the other war." Another Socialist member, Albert Poulain, who is fighting at the front and came back expressly for this debate, had already insisted on the soldiers' opinion in one of these corridor conversations, with an untranslatable play of words: "No gallery war (*de travées*) so long as the trench war (*de tranchées*) is going on! For us, the only adversary is the Boche!"

War Minister Millerand, who was called in reality to defend his whole administration from the beginning, uttered the same sentiment: "To preserve due serenity, I have only to keep before my eyes, as we were invited to do the other day by Paul Deschanel, President of the Chamber, the thought which does not quit me of those who, at this very moment, are struggling and suffering and dying for us."

This has been, from the first, a part of the *Union sacrée* which sinks political differences while the nation, whole and entire, is struggling for its existence. It has been a tacit rule of all Parliamentary procedure. The surface agitation which seemed to threaten this in the eyes of outsiders has been made the subject of one of those caricatures of Forain which have become historic. Before the Parliament House, three members are engaged in secret confab. One says warningly to the others: "Speak lower—they hear us at the front!"

What alone alarmed patriots was the apprehension of a confusion of powers such as General Grant is said to have avoided by cutting the telegraph lines between himself and Washington. M. Millerand, with his usual courage, spoke out his mind, which a very little reflection showed was the mind of all Frenchmen.

"To leave its full and entire freedom of action to the military power in no way implies the suppression of Parliamentary control [note always that the word "control" is used in the French sense of effective supervision, not of command or direction]. I venture to say, gentlemen, that it is ridiculous to pretend to suspect on such a point the sentiments of a republican who, in a career already long, has never separated the Republic from Parliamentary rule and who, at his modest post, has always been in the first rank of those striving against the attempts of personal power."

This allusion to covert attacks in the press and in conversations he followed up by adopting as his own the words of another, deprecating that "at any moment any confusion should be possible in the army between the Parliamentary power—which you represent—and military authority."

"In war, authority and responsibility cannot be divided up. Each military chief controls the acts of his inferiors and is himself responsible for his acts to his own chiefs. The general commander-in-chief is responsible to Government, which can remove him if it does not approve his acts. There can be no other control during action."

War Minister Millerand read this out impressively and added: "I know nothing clearer, juster, stronger, than this expression of General Joffre. What does it mean except that, like all citizens, public powers must know how in time of war to impose on themselves a voluntary discipline which leaves to the military authority, charged with the operations and responsible for them, the liberty which is indispensable to their success? Of such discipline we have given the example for the year that is past. Our allies count on us to continue; our enemies have hope only in our divisions."

The cause was really already won. The solemn ratification of this political union behind the armed unity of the nation was to be made at a final session, with a renewed declaration from the head of Government such as consecrated the historic session of the opening of war, on the 4th of August a year ago. For this, Prime Minister Viviani's voice was necessary. His eloquence is known, and he was again equal to an occasion such as is offered to few men and in few generations. Of his long speech, which by unanimous vote (except for one disgruntled polytechnician) has been posted up all over France, I select only the one passage which is useful—perhaps necessary—to rectify foreign opinion:

"Ah! I know that the German press, disguising disillusionment behind haughty arrogance or subtle manœuvres, is trying to make out that there are fatal and deadly divisions among Frenchmen. Well, let us speak clearly, in the enemy's face! Yes, there are among us divergences of thought and discordances of speech. To begin with, these are of the very essence of Parliamentary rule, and we have been accustomed to them by the fever which the Revolution gave us. There would be a fatal division if we should perceive somewhere, in some corner of the country, even a restricted collection of citizens who thought of making a shameful peace."

Here the entire House rose to its feet and applauded from every political bench.

"Where is there such a collection? Let it be shown so that unanimous public opinion may reduce it to impotence. As to me, I know only Frenchmen who disagree maybe as to the means but are all of one accord as to the end, who are ready publicly to renew the oath which we made each other a year ago and to say over with our allies—Never shall we lay down our arms until we have made sure the triumph of right, until we have banned beyond possibility the return of like crimes, until we have restored to political and economic independence heroic Belgium, until we have taken back our own Alsace and Lorraine.

". . . Ah, yes! believing in social and religious and political divisions, our enemies imagined that our country was divided beyond reconciliation. What have they seen? Laborer and employer, artisan and peasant, rich and poor, men of every party and religion, all offering themselves to the sacrifice, all fulfilling at once their military and their human duty, their military duty in defending their country and their human duty—as at the hour of the Revolution—in defending the liberty of the world. And now they shall see a Parliament like that which offered the spectacle of that 4th of August . . . and it is for ourselves to regulate our own relations."

From the Right, applauded even by the Socialist Left, Denys Cochin, who has one son slain, one wounded, and one under fire, added "How few among us have been spared by mourning and bitter grief!" Truly, the Union is sacred.

Zionism and the Struggle Towards Democracy

By H. M. KALLEN.

At the beginning of the great war there were over 100,000 Jews in Palestine. Broadly speaking, they were divisible into two classes, rapidly fusing into one. The first class were mainly inhabitants of Jerusalem, European Jews, who, under the pressure of a religious idea, had gone to Palestine to die, and who, failing death, survived and bred in a sort of Orientalized death-in-life, and were sustained in that condition by the pious charity of other European Jews. The second class were mainly inhabitants of the coastal cities and the agricultural colonies. They were also European Jews. Under the pressure of a social ideal they had adventured into Palestine to live, and having come to live, had brought the message of life and self-respect and independence to those who had journeyed there to die. They built forty-one agricultural colonies with coöperative features; they put into execution, in several of them, significant experiments in economic justice; they built garden-cities, established social settlements, gymnasiums, workingmen's clubs, literary and learned societies, a national drama with community theatres, a national press and a national library, a school of arts and crafts and a public-school system—from the most approved form of the modern kindergarten to excellent gymnasia. They urged and projected a national university, and only the war came in the way of its foundation. In short, they created under the impetus of a profoundly democratic social ideal a spiritually autonomous, characteristic national Jewish life.

The language of this life is Hebrew; its ideal is formulated in the programme of Zionism. The agency by means of which it was being realized is the Jewish National Fund. This fund is the national treasury of the Jewish people. It is the result of a voluntary tax which Jews all over the world levy upon themselves as they choose. Its function is to acquire land in Palestine as the permanent and inalienable property of the Jewish people, and to guide and assist the healthy growth and free expression upon that land of their culture and spirit as "the indispensable ground for the fullest service of the Jewish people to all mankind."

The realization of the Zionist programme is thus, it will be seen, a fact. Although far from consummation, it was, when the war broke out, steadily in progress. Its initiators were a body of tenderly-nurtured young Russian Jews, intellectuals who, although ignorant of the land and its conditions, adventured—because of the immemorial Jewish love for Palestine and in obedience to the urge in them towards a free and self-respecting life as Jews—as pioneers to win this life under an indifferent and sometimes hostile Government, against inimical neighbors and disease, and upon a denuded soil. This enterprise would have been merely another communistic flash-in-the-pan had it not in fact been the symbol of the common will of millions of terrorized and oppressed people, a will which needed only organization and direction to become efficacious.

The necessary organization and direction came to it through the efforts of Theodor Herzl. This brilliant and magnetic leader, ostensibly a Viennese of the Viennese, resident in Paris, was led by his observation of Jewish disabilities and anti-Jewish agitations in Western Europe to conceive a "Judenstaat" whereby the maladjustment might be relieved. His first intention was philanthropic rather than humanistic, the mitigation of an evil, not the creation of a good.

Consequently he took his plan to financial magnates of Jewish extraction all over Europe. These would not listen to him. "Civil rights" for Jews in Western Europe were then hardly a generation old. They had been won at the cost of suppressing and eliminating as much as possible of what was distinctively Jewish; in fact, by denying the reality of Jewish nationality and designating the Jewish people as merely a religious sect. From the complete exercise of these rights the so-called "emancipated Jews," of whom the magnates were the leaders, were still far; to attain it they developed a sort of protective coloration by virtue of which they could not cease to be Jews, but did become amateur Gentiles, ashamed of their Jewish connection and concealing it so far as possible. Withal, although they had cut themselves off to the limit of their power from the Jewish people, they presumed to legislate and speak for them. They were, in fact, the natural successors of the mediæval "Hof-Juden," those mediators between the Jewish masses and the neighboring peoples; but while mediæval conditions had ceased to obtain in Europe, their attitude towards the problems of Jewish life remained, and remains, hieratic and mediæval.

Hence those that listened to Herzl were the intellectuals, who had reflected upon the contradictions in the Jewish position, and the great masses in Eastern Europe, who had neither wished nor needed to destroy their self-consciousness as a nationality. The first Zionist Congress, held in Basle, Switzerland, in 1897, defined the general alignment of the Jews of the world on their own status and destiny. It arrayed the intellectual, the "progressive," and the masses, against the clergy, the radical, the Bundist, and the classes, but it showed in the range and variety of its membership how potent over all differences was the common denominator, Jew. Since the congress the radicals have been slowly coming over, partly through a realization of their own hopeless abstractionism, partly through a realization that Zionism is the one practical answer to the Jewish question, in that it has provided the Jews of the world with a common instrument for its solution, for registering their corporate wishes and carrying out their corporate purposes.

These wishes and purposes were not, however, remedial. They were expressive and constructive. The first congress made much of the tragedy and injustice of the Jews' position, but this fact fell, in the course of the successive congresses, more and more into the background, most conspicuously in Herzl's own mind. Between the publication of his "Judenstaat" and his "Altneuland" he had learned to share the vision of the people. Zionism became first and foremost the Jewish programme of international service through national self-realization, aiming to lay in Palestine the foundations of a new and living Hebraism, which, under modern conditions, should carry into effect the social and spiritual ideals of the Hebrew prophets, and so fulfil, in Mazzini's words, the Jews' "special function in the European work of civilization." Its democracy was double. To the Jews of the world it came as a programme of self-help and social justice within Jewry; giving the same rights and responsibilities to both sexes, and actually trying out experiments in economic organization to abolish the exploitation of one man by another without abolishing the impetus towards individual excellence. To the nations of the world it reasserted the prophetic ideal of internationalism as a democratic and coöperative federation of nationalities, an ideal which Mazzini had formulated for Western Europe half a century before. Zionism asks, in the light of it, the same freedom for the Jewish people to realize its national individuality as a people that is demanded by all European peoples for themselves. Within Jewry and without, it took its stand flatly upon the principles of democracy and nationality.

To do this meant to face the energetic anathema of de-Judaized, anti-Jewish "Jewish" *haute-finance;* to accept the risk of the vengeance of a Russian bureaucracy devoted to the policy of the "Russification" of the Empire by making the Jews scapegoats for the errors and misdemeanors of the Government. Both were faced. The last suspicion of philanthropism was abolished at the sixth congress, in 1903, by the heroic rejection, through the vote of the very groups who might most have benefited by acceptance, of the British offer of a territory in East Africa. That vote declared the people's unchangeable will to place the legally assured home of the Jews in Palestine and nowhere else. It alienated the philanthropically-minded, notably Mr. Zangwill, who, not being democratic enough to accept the decision of the majority, withdrew in 1905, one year after Herzl died, and set up an organization of his own.

The split added to the difficulties which the movement confronted. Nevertheless, the work went on, in Russia against overwhelming difficulties; in the rest of the world against the obstructionist tactics of the well-to-do Jews; in Palestine itself against the uncertainties of the law of the land, the

irresponsibilities of officials, the enmities of neighbors. Particularly there was the delicate task of teaching the Turks to understand that, since their Empire was organized on the basis of nationalities or *millets* (the term is religious, but it implies nationalities in the Turkish system), an accretion to the Jewish *millet* in Palestine would strengthen the hands of the Empire. Little by little the movement made headway. As its purposes became better understood, it gained the universal respect of the non-Jewish world, and the adherence and sympathy of Jews, particularly of the intellectuals and the young. It brought spiritual freedom and self-respect to the amateur Gentile in the West, giving him an impersonal ideal to live for and international social purpose to attain. For the Jews in Russia, confronted with harsher and harsher measures of repression, it became a gospel of salvation. To Palestine it brought a new life, in the building of which even non-Zionists, particularly in America, coöperated. Willy-nilly, it was becoming the Jewish centre of vision and action for all the Jews of the world, bidding fair by slow and peaceful and largely unconscious development greatly to mitigate, if not to solve, the chronic "Jewish question," when came the war.

The war has made the principles of democracy and nationality for which Zionism stands the paramount issues of contemporary life. Because the Russian bureaucracy, to cover the treachery and incompetence of its officials, has once more made the Jewish people its scapegoat and converted the Pale of Settlement into a Belgium thrice repeated, the war has brought the chronic Jewish question to a crisis. Turkey's participation in it has jeopardized the hard-won beginnings of a generation in Palestine. The tragic anomalies of the Jews' position have never been so explicit, nor the need for healing action so great. Under the circumstances the responsibility has fallen, naturally, upon the Jews of America, and how they will carry it must largely influence the fate of the Jewry of Europe.

With respect to Zionism, the same conditions that obtained among European Jews obtain among American Jews. At the beginning Zionism signified a social programme based on a democratic social philosophy only to the Jewish immigrant; for native American Jews who sympathized with it, its implications were chiefly philanthropic. The changes in sentiment were here the same as in Europe. Most violently opposed by the extreme radicals and amateur Gentiles, it gained its adherents among the intellectuals, the students, the "progressives," and the working classes, and it is from the last, in fact, that its greatest strength comes. The Jewish masses look to Zionism for leadership on all questions pertaining to the Jewish people as a whole. That, in the present crisis, they feel their obligation, and wish to assume the burden of it, any reader of the Jewish press may see. The means proposed is a democratically constituted congress of Jews, and the press, the great fraternal organizations, the *Landsmannschaften*, have united in requesting the Zionists to lead in the formation of this congress. To accept their mandate means to carry the struggle towards democracy within Jewry one step farther. Powerful interests, interests analogous to those which opposed the calling of the first Zionist congress by Herzl, are opposed to such a gathering of Jews, and for analogous reasons. The Zionists have accepted the mandate. They propose to call, in coöperation with all Jewish organizations in the country, a congress which shall be representative of all our Jewish citizenship, and which shall discuss publicly and freely every phase of the Jewish question, shall formulate some programme of action. It is hoped that this may, with the assistance and sympathy of the enlightened public opinion of the one great neutral country, which has done so much to ease the plight of the Belgians, make a way to permanent peace and freedom for oppressed Jews.

Notes from the Capital

SAMUEL GOMPERS.

By keeping him so continually in the public eye as an industrial oracle, the European war has given one resident of Washington the time of his life. This is Samuel Gompers, cigar-maker, agitator, diplomatist, and president of the Federation of Labor. Nothing pleases him more than such publicity, for it is a valuable asset in his business. He has used it for years, with an effect undreamed of by people who do not come into hostile contact with him: witness his successful fight to procure immunity for labor unions under the Anti-Trust law. Congress dares not take a step which touches the labor question at its remotest edge without consulting Gompers. A former Commissioner of Indian Affairs, hoping to train some of his wards into a habit of self-support and teach them the value of a dollar, prepared plans for a series of public improvements on certain reservations—building roads, bridges, storehouses, etc.—on which he was to use Indian labor at the current rates of pay; but, as most of his red workingmen had to come a long distance from home, it was found that an eight-hour day would not answer, so a ten-hour day, with only five working days in the week, was substituted. Some pettifogger protested to the Secretary of the Interior that this arrangement violated the statute limiting to eight hours the working day of all laborers and mechanics employed on Government work. The Commissioner, therefore, proposed to procure an amendment making the statute inapplicable to work done by Indians on their own reservations for their own benefit. When he brought his measure before one of the appropriate committees of Congress, the first question put to him was: "Have you seen Gompers?"

There was no help for it. See Gompers, or drop the subject. Gompers, accordingly, was seen. He vetoed the project at once. It availed not to point out to him that the local conditions were so unusual as to compel a resort to unusual methods; that the Indians were interfering with no other laborers, since, unless the work were done by them, it would be left undone; or that the work was not Government work in the sense intended by the law, being charitable and educational only. A great principle was involved, Gompers declared in oratorical tones, and nothing, however philanthropic, could be permitted to get in its way. So the officer who had pocketed his pride so far as to plead as a favor for what the Government should have demanded as a right, had to abandon his enterprise, and the Indians, who had enjoyed the bare beginnings of a new life, lapsed back into comparative idleness.

In this incident we may read a fair measure of Gompers's intelligence, if we have not already read it in his appearance. Note his big head, heavy foreign features, and burly frame. His face is as hard as a mask, his voice has nothing winsome in it, his manner is forbidding. We can hardly be surprised at learning that in the financial struggle of the early nineties he was on the side of independent free coinage of silver by the United States, or that he found not a little to commend in Coxey's programme of economic reforms. He has always opposed compulsory arbitration as a remedy for industrial troubles, lest it "might react dangerously against the progress of organized labor," which "has too slender means at its command to indulge in dubious experiments." One of the worst mistakes he has made in all his life was his failure to advertise these theories when the ill-fated boycotts were declared against the Bucks Stove & Range Company and the Danbury hatters, or when the dynamite squad headed by John J. McNamara—for whom Gompers vouched as a worthy citizen—undertook their murderous campaign of terrorism a few years ago.

To do Gompers justice, his most conspicuous faults are probably due more to his slow perception of relations and issues which most persons apprehend by instinct, than to deliberate obduracy. In spite of his hard-handed creed, he is not personally a man of violence. I do not recall any instance where he has resorted, in his industrial warfare, to the German submarine practice of firing without warning. He condemns mercilessly the methods of the I. W. W. Whether he would become a Socialist of the advanced type if that offered the only opening for his work for labor reform, it is hard to say—perhaps he would. For the present, however, he sees no need of revolutionizing the whole structure of society in order to make life more comfortable for the wage-earner; the existing organization, based on the competitive idea, seems to him to fit human nature better than any novel scheme of things evolved from mere ratiocination without the support of common experience.

Gompers is of Dutch ancestry, but was himself born in England. This is undoubtedly what makes him feel so competent to teach Americans the way of industrial salvation. He combines in his vocabulary a pretty fair assortment of several languages spoken by our immigrant laborers, so as to be able to make himself understood by almost any restless audience he is called to address on his favorite topic. The perfume of the cigars which he smokes very steadily, when contrasted with the neatness of their wrappers, indicates that his eye is more highly cultivated than his taste. TATTLER.

Correspondence.

FROM THE FRONT.

To the Editor of The Nation:

Sir: You are more than kind. I can't say how grateful I am for the parcel of papers. I promise myself a fine feast on them one of these days. What a fine paper the *Nation* is! My card to you (rather cheeky, but circumstances out here are so singular that perhaps you will excuse that) was prompted by a stray copy that came my way (as a matter of fact, a few pages only). So refreshing to read something cool and detached in these days of confusion and madness!

Lucky people you are to be detached! Not that I would have *us* out of it. That would be an unbearable shame (though I, for one, did not realize it till the last moment last year)—worse than the agony of seeing good English blood wastefully drenching the land. That sounds to you an extravagant expression, perhaps, but in the Fertubert attack in May (that happens to be the only actual battle that I have seen at close quarters), so much was pretty well literally true. From the R. A. M. C. standpoint you don't see much of the intoxication and glory of fighting—but what misery and suffering!—measureless woe . . . The other day I recalled from ante-bellum memories a scrap of talk I had with an uncle of mine about the Boer War (then I was a schoolboy). I said: "How could you grown and rational people of thenadays bear to see the casualty lists in the papers? Could you endure to think what sum of suffering they represented?" A year or two, and myself not seeing undreamt-of casualty lists, but the casualties themselves!

I wonder if any one in America is taken in by talk of the noble human qualities only developed by war? Utter nonsense! One is noble, or just even decent, in spite of war. (How ingrained with civilization we English are to have been so decent out here!)

I take leave of you, my dear sir, with best regards, and homage to the *Nation*.

Richard Capell.

1798, 6th London Field Ambulance, August 27.

THE PRICE OF WAR.

To the Editor of The Nation:

Sir: During the months of April, May, and June of this year I was in Paris as one of the resident surgeons of the Harvard University Medical Unit, which was in charge of the University Service at the American Ambulance Hospital. We had the direction of 190 beds, which gave us a very large and varied experience in war surgery. Necessarily my outlook on the war itself was somewhat restricted, but the opportunity to talk with men fresh from battle was unlimited, and this, combined with what I heard from friends who were within the zone of active fighting, gave me gradually a very full appreciation of what is going on and of what the actualities of war consist in. Our wounded often reached the hospital within twenty-four hours of being hit, and sometimes within twelve hours. These men told their experiences with the bitterness towards their enemies which only a war can generate. Some, of course, were too sick and some too unintelligent to tell us much of interest. But many, and indeed most, were eager to give their news, and gave it well. All were French, but the stories told were not only of German inhumanities, but of their own doings, which to them seemed the only possible solution, but to us savored much of the very actions for which we at home are prone to blame chiefly the Germans. I well remember a Zouave sergeant telling with anger, coupled with satisfaction, of an attack two days before his entrance to the hospital. The French stormed and carried the first line of German trenches. His immediate company took about two hundred prisoners. They had to pass on with the general forward movement or be mowed down by a disastrous fire, so they left a mere handful to guard the Germans. The prisoners, however, overpowered their guard and began shooting their former captors from the rear. Turning swiftly, the Zouaves retook these men and, burning with the rage of the moment, lined them up and mowed them down with a machine gun. He told his story simply as a mere event, and, indeed, his only anxiety was how soon should he be able to return to the front and get at "les Boches" once more.

Then, too, I heard definitely of the Germans in Alsace, in the Vosges sector, killing off all the French wounded, and a French officer professed to have seen a struggling French child pinned to its home floor with a German bayonet. Indeed, we learned much of war in those three months, and it is the curious, non-comprehending attitude of those at home which prompts me to write this. It is not written as a mere tirade against war, a mere invective like some outbursts of the anti-bellum feminists, but only that people may try to realize just what war is. I would not condemn war utterly as a thing never to be brought forth, for the need might arise with us at home, but I would only impress as sharply as I may what a terrible thing it is and how very slowly to be entered on. Surely, the reasons for the United States even to presume entrance into the present catastrophe are still quite dormant. For war must be held as a last recourse, and any injured sense of pride or dignity, especially if dependent on a quite unjustifiable, strong diplomatic message, is but a poor excuse.

The arguments put forward commonly as embodying the benefits to be derived from war include patriotism, a sharper nationality, personal bravery, unselfishness, and a great stimulus to religion. All these I accept as facts, and fresh from contact with them know that these attributes do accrue. Personal bravery, unselfishness, and religion are most certain benefits, and the new era of religion in France is a truly great thing. The people find tremendous solace in their churches and in their belief. I attended a great fête-day processional and service in St. Ouen in Rouen, and have never been more impressed with the great power for good that resides in religion in times of stress. The mass of the congregation, mostly women, and almost all in black, left that service with something in their faces that expressed a tremendous satisfaction, as if some immeasurable strength lay behind them. But what of patriotism and a firmer and closer nationality; is it after all so very desirable? There is no doubt about its stimulation through war, for only think of the fervent devotion to a country troops must have once dispersed to their homes after a long defensive war. It is, indeed, incalculable. Yet I am struck by this danger, that the intensely patriotic land is the very one most easily touched off to war.

Now, what have we against war? Well, we have everything that comes within the scope of its actualities, besides almost all its results. Then, as if this were not enough to convince one, there is the absolute futility of the game itself, the barrenness of material advantages, the waste, not only without gain, but with an actual loss. Even from the coldest philosophical view, the loss far outweighs the gain. For the loss is immeasurable, whether measured in the exchange of mankind, money, or in that of God, which includes such things as life, suffering, rape, torn and crippled children, horror, anguish, starvation, sickness, and death. Yes, there can be no expressions too horrible here, for war is quite beyond description. Modern war knows no limitations, for now it is not armies who fight, but whole nations, and each must win. Victory is the only defence, so it must be sought at all cost. So there must be new rules drawn. But it is still further a new game, in that the rapid-fire gun, the submarine, and the heavier-than-air machines have brought in new possibilities for destruction and terror. So one sees the absurdity of applying any of our obsolete codes of international law and rules of warfare to the present catastrophe. Here is where the ideas of our friends at home seem most off the track and most puerile. They seem to have failed to grasp the entire situation, and look at it as from fifty years back. I find people wild still over the incident of the Lusitania, and some even demanding the entrance of the United States into the maelstrom. It seems, I suppose, cruel and brutal to say so, but I find no especial enmity against the Germans for this single incident, for, first, old rules cannot hold good, and, secondly, it is no worse than, if indeed as bad as, what is occurring daily in the war zones of the great armies. Is it, indeed, worse than the shelling of populated and defenceless towns, the rape of women, the killing of children, the dropping of bombs on hospitals, the use of poisonous gases to asphyxiate the enemy, the shooting of prisoners in groups of as many as two and three hundred, or, indeed, than the single cases of terribly lacerated and infected wounds which reach the great base hospitals from the front each day? Early in June I saw an encampment of British troops at Rouen, some 100,000 or more. How many, think you, now tread the ground alone and unsupported? For in these days the daily casualties total many thousands. Oh, it is all so much worse than one can imagine that single incidents cannot seem so very large, nor a single horror bring any special rancor to my soul. And here I do not want people to think that I depict only one side of the situation, for such horrors as the shooting of prisoners occur frequently on the side of the Allies, too.

And I came home to find even my own people wondering if we hadn't better get into the war! What, I beg of you, could we benefit, or any one else? What gain can be worth the price? And what now could be our justification? As an old officer in one of our wards said, "Keep your people out; there are enough in it now; and if they seem set on it, let them see only five kilometres of the front, and that will suffice to keep them out." I, who have heard at first hand of soldiers finding children pinned to the floor with a bayonet in them, who have talked with men who have seen babies torn and quarter-

ed, and with those who have turned machine guns loose on two hundred unarmed prisoners like so much leaden spray to relieve an attacking party of an encumbrance, have some idea of the horror, brutality, and terror of the game. It is a lesson one cannot learn from books, for other wars were not of this kind and worked under a different set of rules, so those at home cannot hope to appreciate how bad things are, and how cheap life is on the other side.

War to me has become a terrible Demon, overstepper of all the limits of humanity, charity, and Christianity, and I shall feel intensely depressed until all danger of my country entering into it has passed. Though I believe myself personally not to be a coward, I would accept many a slight and insult in quiet restraint rather than enter into such a maelstrom, for my reason depicts the futility, and my sight and hearing have taught me its horror. The price is beyond conception, and I would impress this on all.

ELLIOTT C. CUTLER.

Boston, Mass., September 15.

[With our correspondent's feeling concerning the horror and brutality of war, and especially this war, every one must agree. But his confusion of thought in regarding the calculated and appalling crime of the Lusitania massacre as merely an ordinary item in the long count of war's fearful incidents we cannot allow to pass unnoticed. And the same confusion exists in what he says concerning atrocities on land. The odium the German cause has had to bear on this head rests not on miscellaneous charges of sporadic barbarity, but on clear proof of systematic terrorism and rapine.—ED. THE NATION.]

A FOREIGN MISTRESS OF FRENCH.

TO THE EDITOR OF THE NATION:

SIR: Reading your interesting article on "Foreign Masters of English" (*Nation*, August 12, 1915), I note that your contributor rightly quotes the example of José Maria de Hérédia, who, though a Cuban by birth, showed himself, in one small volume of verse, a supreme master of the French language. Another appropriate instance would be Madame de Noailles, born and educated in Rumania, the best of the living female poets in France. But the natives of Cuba and of Rumania have imbibed a Latin language, and, when they take up French as a poetical medium, the difficulty, though great, is not overwhelming. The case is quite different when a girl, born in England of a Scotch father and an American mother (from Honolulu), begins to write French verse at the age of twenty-one, and in the brief space of ten years produces some of the very finest examples of poetry, not only in French, but in any literature. That girl, Pauline Tarn, who assumed the *nom de plume* of Renée Vivien, died of exhaustion in Paris, in October, 1909. I called attention to her in *Notes and Queries* (June 20, 1914, p. 488), as to one of the most astounding literary phenomena of our time. As she is yet little known, even in Paris, I have repeatedly found the occasion of reading some of her poetry to good judges who overlooked her name, and have witnessed the growing emotion and admiration of the listener, culminating in the verdict that nothing finer had ever been written in French. Pauline Tarn's vein was somewhat monotonous, and she was, if I may say, short-breathed; her longest poems do not extend to one hundred lines. She could not have written "Jocelyn" nor "Rolla." But Hérédia, too, was a poet of short breath; where quality is appreciated above any flow of facility and eloquence, the shortness of Pauline's poems must only enhance their exquisite and almost unparalleled perfection. Her volumes of verse are obtainable in Paris from Lemerre & Sansot; the two best are "Etudes et préludes" and "A l'heure des mains jointes." Allow me to quote a specimen from the former, of which I have had the privilege of seeing the manuscript, finished in June, 1900; Pauline, born in 1878, was only twenty-two when she wrote those glorious lines, in which, as I have authority to state, she depicted her own mood and vein of thought.

BACCHANTE TRISTE.

Le jour ne perce plus de flèches arrogantes
Les bois émerveillés de la beauté des nuits,
Et c'est l'heure troublée où dansent les Bacchantes
Parmi l'accablement des rythmes alanguis.

Leurs cheveux emmêlés pleurent le sang des vignes,
Leurs pieds vifs sont légers comme l'aile des vents,
Et le rose des chairs, la souplesse des lignes,
Ont peuplé la forêt de sourires mouvants.

La plus jeune a des chants qui rappellent le râle:
Sa gorge d'amoureuse est lourde de sanglots.
Elle n'est point pareille aux autres—elle est pâle,
Son front a l'amertume et l'orage des flots.

Le vin où le soleil des vendanges persiste
Ne lui ramène plus le généreux oubli;
Elle est ivre à demi, mais son ivresse est triste,
Et les feuillages noirs ceignent son front pâli.

Car elle se souvient des baisers qu'on oublie,
Elle n'apprendra pas le désir sans douleurs,
Elle qui voit toujours avec mélancolie
Au fond des soirs d'orgie agoniser les fleurs. . . .

I have read many letters written by Pauline in simple, good-natured, unpretentious English; but though she admired Keats and Swinburne (sometimes imitating the latter), I think that she never wrote and am sure that she never printed a line of English poetry. Her friends in Paris, where she passed the greater part of her life, were almost all English and American; her colloquial language was English; but that of her heart, of her enthusiasms, and of her sorrows was French. Guided by an unerring sentiment of euphony, inspired by the very genius of the language, she immediately rose to a perfect grasp of French lyricism at its best; there is not one unidiomatic line, not one journalistic platitude in her works. The only parallel I could quote is the last of the great Roman poets, the Greek Claudian, a native of Alexandria.

SALOMON REINACH.

Saint Germain en Laye, August 25.

THE UNION OF DEMOCRATIC CONTROL.

TO THE EDITOR OF THE NATION:

SIR: In your "Foreign Correspondence" you describe the Union of Democratic Control and certain other societies as forming "the most insignificant of backwaters in the current of British opinion." Would you allow me to state that the Union of Democratic Control and its affiliated societies have an aggregate membership of a quarter of a million and that the U. D. C. itself has already above sixty branches scattered all over Great Britain? The object of the U. D. C. is not "to ride off on a general condemnation of war." Its objects are, shortly, as follows: (1.) To secure control of foreign politics for the people. (2.) To prevent the forcible annexations of provinces or countries against the wishes of their inhabitants. (3.) To bring about the abandonment of the "Balance of Power" policy, and to institute a real "concert of Europe." (4.) To secure the reduction of armaments and the nationalization of armament works.

May I mention, also, as your London correspondent seems to have given a contrary impression, that the U. D. C. has always held that it is imperative that the war once begun should be prosecuted to a victory for our country?

ADRIAN STEPHEN.

London, England, September 6.

A BELGIAN POET'S TRIBUTE TO AMERICA.

TO THE EDITOR OF THE NATION:

SIR: Some years ago a number of us Belgians met around a table. We were artists, writers, poets, whom the destinies of life have now widely separated. We had graduated from different Belgian universities, and we were comparing our college souvenirs. That perfect poet, Charles van Lerberghe, Maurice Maeterlinck, and the painter, Theo van Rysselberghe, whose work has received much praise of late at the San Francisco exhibition, were all from the Flemish University of Ghent. That sagacious critic and pure singer, Albert Mockel, took his degree in heroic Liège, while impetuous and great Verhaeren had as his *alma mater* poor Louvain. The admirable novelist, Eugène Demolder, whose style is so full of color—as witness "La Route d'Emeraude" and the "Jardinier de la Pompadour"—and I had been undergraduates together in the now insulted Brussels, where I studied law and philosophy.

That evening, when we sat at the table, we talked on gayly about various things, and we argued ardently over arts and letters. Finally our thoughts and words got on to America, and then we all saw only the same names, which shone like hallucinating beacon-lights across the ocean. There stood your piercing, subtle Whistler, and those two poets of genius, so different and so opposed to one another—Poe, whose imagination was always governed by the will, by the intelligence and taste; and by contrast, that rough and tumultuous Walt Whitman, that world of visions so well defined in these lines of his:

In a little house keep I pictures suspended; it is not a fix'd house;
It is round: it is only a few inches from one side to the other.
Yet behold, it has room for all the shows of the world, all memories!
Here the tableaux of life, and here the groupings of death.
Here, do you know this?—this is Cicerone himself.
With finger rais'd he points to the prodigal pictures.

Walt Whitman, Edgar Poe, and Whistler were all we knew or wished to know about the United States. Maeterlinck, it is true, mentioned Emerson, and our youthful memories still kept alive scenes from Fenimore Cooper. Some of us were not wholly ignorant of Washington Irving and Longfellow, nor of Hawthorne, Bret Harte, and Mark Twain, and we had read or been influenced by Mrs. Stowe's "Uncle Tom" and Miss Cummins's "Lamplighter." And that was all. In a word, we had but a very confused idea of America, and we knew no Americans.

But to-day the whole face of things has changed. In this crisis we do not stop with

what appears, in the case of certain statesmen, to be something, more or less comprehensible, that resembles tergiversation, hesitation. We Belgians grasp fully but one thing, well expressed in words of our poet Verhaeren, "in the smallest Belgian hamlet floats on a house the star-spangled banner," and there it is that our compatriots, during this long and grievous martyrdom, find assured them a little comfort and solace; there they are fed, thither they hasten in order to escape from the ravages of biting famine.

And when I think of my unfortunate fellow-countrymen caught in that terrible net, I overflow with thanks which come from the very bottom of my heart to you Americans. Memory of you will dwell with us forever. You have won our immeasurable gratitude. Without any thought of reward of even a spiritual nature, you hurried to the succor of a shattered and oppressed people. And may you therefore be ever twice and three times blessed! ANDRE FONTAINAS.

Paris, September 2.

Poetry

SPEED.

By LOUISE IMOGEN GUINEY.

I. The Motor: 1905.

From hedgerows where aromas fain would be
New volleyed odours execrably rise;
The flocks, with hell-smoke in their patient eyes,
Into the ditch from bawling ruin flee:
Spindrift of one abominated sea
Along all roads in wrecking fury flies
Till on young strangled leaf, on bloom that dies,
In this far plot it writes a rune for me.

Vast intimate tyranny! Nature dispossessed
Helplessly hates thee, whose symbolic flare
Lights up (with what reiterance unblest!)
Entrails of horror in a world thought fair.
False God of pastime thou, vampire of rest,
Augur of what pollution, what despair?

II. The War: 1915.

Speed without ruth, seedsman of vile success,
Accustomed sight to ne'er-accustomed view!
Am I not vindicate who strongly knew
Some portent there of pregnant ugliness?
The dooms are in; my soul hath won her guess.
That which formed thee and franchised, had the cue
To push all rudeness forward, and was due
To spawn ere long the sovereign menace. Yes,
Horror has come, has come! Horror set high,
And drunk with boundless access, whirls amain:
Lost on the wind is Belgia's holy cry,
And Poland's hope shrinks underground again,
And France is singing to her wounds, where lie
The golden English heads like harvest grain.

Literature

THE GERMAN WAR-PARTY.

J'Accuse! Von einem Deutschen. Lausanne: Payot & Cie. 4 frs.

I Accuse! By a German. Translated by Alexander Gray. New York: George H. Doran Co. $1.50 net.

If Zola should come forth from the Pantheon he would not deem unworthy this eloquent arraignment of the German war-party "by a German." In the name of justice, of truth, and of Germany's best interests the anonymous author dissects with merciless force the follies, self-contradictions, and perversions of truth with which Bethmann-Hollweg has fed a too docile German people. By using the Chancellor's Reichstag speeches, which are printed in an appendix, and by analyzing the various diplomatic papers which have been published, he effectively condemns the Chancellor out of his own mouth.

His purpose is sincerely patriotic:

> The confidence of the German people has been basely abused by its leaders and rulers. Their eyes, which once saw so clearly, have been wrapped in the gloom of ignorance. . . . From the *populo male informato* I appeal to the *populum melius informandum.* . . . You say that the Truth helps our enemies? You great children, who shut your eyes to escape danger. Long ago the enemy knew the truth. . . . So I finish my book as I began it, with a clean conscience, and with the sure feeling of having done a good work, and, if justice is done, of having deserved the thanks of my country (pp. 420-423).

As acknowledgment of authorship would be dangerous, and as such a book could not be printed in Germany, it was entrusted to a Swiss, Dr. Anton Suter, who had it printed at Lausanne. Even then it was deemed advisable to omit certain passages, and these are indicated by blank spaces. In spite of this emasculation, it is still so powerful an indictment of a neighboring state that the Swiss authorities, so it is reported, have forbidden its sale and transmission through the mails—but not until after many thousand copies had been sold. Who is the author? He answers himself:

> A German who loves his Fatherland like any one else; and just *because* he loves it, he wrote this book. Born on German soil, trained in German culture, German in his ancestry, his speech, and his thought, he knows all the virtues of the German people, but he also knows their failings and their weaknesses (p. 420).

Having read the book in the German original as well as in the English translation, which is excellent, the reviewer believes that all the internal evidence, with the possible exception of the question of the omitted passages, supports the truth of the author's assertion about himself. There are other incidental indications that he is at least fifty years of age, that he has probably studied at a German university, that he has spent several years in France, and that he is acquainted with the United States. In fact, he was evidently returning from America to Munich and Berlin via Genoa a few weeks after the war broke out. That he is well-read and well-educated is suggested by his admiration for Tolstoy, his quotations (in English) from Swift, Hume, and Buckle, his apt use of French phrases, his frequent application of maxims from the Roman law, and his numerous references to German literary writers. He appears to have a legal habit of thought. A couple of expressions condemning anti-Semitism are not enough to write him down a Jew. But his apparent presence at the adoption of the Peace Manifesto of the Internationale at Berne in 1912, his references to Bebel, and his habit of quoting from *Vorwärts*, show his kinship with the Social Democrats.

Here is the indictment:

> That the plans and preparations for this war have long been made by Germany and Austria, not only from a military, but also from a political point of view;
>
> That for long it had been resolved to represent this offensive war to the German people as a war of liberation, because it was known that only thus could the necessary popular enthusiasm be awakened;
>
> That the object of this war is an attempt to establish a hegemony on the Continent and, as a later sequel, the acquisition of England's power in the world according to the principle "Ote-toi de là que je m'y mette" (p. 34).

By "Germany" here he means not the German people, not even the German Government, but the war party in Germany which secured the upper hand on July 29, 1914. In the chapter on The Historical Antecedents of the Crime he gives a damning review of the activities and growth of this party in the last dozen years—Bernhardi, the Crown Prince, the "place in the sun" business, and the agitation for colonial expansion. He properly reminds the colonial enthusiasts that emigration from Germany has fallen to negligible numbers, and is actually exceeded by immigration into Germany from Poland and elsewhere; also that the German colonies have no material value for the Fatherland, for the trade with the colonies amounts to less than one-half of one per cent. of the total foreign trade of Germany. "Our best customers are, in fact, precisely those countries which we never have possessed, and which we never can possess: England, Russia, France, Italy, America, Brazil, and Argentina—these are our true colonies. These are the countries which open to the German merchant inexhaustible fields of activity, where in free competition with the trading nations of the world he can spread his pinions and make his efficiency felt." He contrasts the Germans in the United States, who to a large extent assume American nationality, with those in South America, who for the most part hold firm to their German nationality. Which German is of more value to the Fatherland? The former, he believes. For the Germans who are naturalized in the United States do not by any means lose their German character and Ger-

man sympathies. They retain their knowledge of German wares and methods and open channels for the introduction of German products into the country of their adoption. They assure for Germany at the close of the war cordial friends and business relations in the United States, when in other countries bitterness and hate will make impossible the renewal of the peaceful penetration of German commerce in anything like the same proportions as before the war. Germans in South America, however, who retained their German nationality, were summoned home as reservists, and the businesses which they had been patiently building up were ruined at a blow. It is only one of the conventional Imperialist lies to assert, as is repeatedly done, that the German who assumes a new nationality is a loss for the Fatherland.

Particularly effective is the author's account of Germany's obstructive policy at the two Hague Conferences, and her refusal to come to a reasonable understanding with Lord Haldane in 1912, or to answer in any way Winston Churchill's suggestion for a naval holiday. It was Germany's fault that armaments went on increasing enormously, with the inevitable consequent increase of suspicion and increase of influence of those who deliberately schemed for war.

Half the volume is devoted to "The Crime"—to the negotiations in the days preceding the war by which Austria and Germany obstructed efforts for peace and deliberately threw Europe into a general conflict. Lack of space forbids any examination of the points against Austria and Germany which he makes in his analysis of the diplomatic papers. Many of them are very shrewd and expressed with telling effect. A few of them, however, do not appear to the reviewer to rest on satisfactory proof or sound premises. Aside from these, he is usually well-informed and accurate.

What he says of the Kaiser's probable part is not new, but is worth noting. He believes that the Kaiser, on return to Berlin, was sincerely inclined to peace. But he was surrounded by a powerful war party, and soon began to oscillate between his own peaceful inclination and their bellicose insistence. Finally, on the afternoon of July 29, in the interview with the Chancellor at Potsdam, he was won over definitely to the resolution to embark on war. "The influences which drove the still hesitating Emperor to resolve on war cannot be proved, but it is possible to guess at them. People who are in a position to know say that those occupying the leading military positions, supported by the Crown Prince and his retainers, threatened the Emperor with their resignation *en bloc* if war were not resolved on" (pp. 188-9). Certain it is that directly after this interview the Chancellor summoned Sir Edward Goschen, and in view of his fear that "a European conflagration might become inevitable," proceeded to make the "strong bid for British neutrality" (British Blue-Book, No. 85). In this connection the author calls attention to the remark which the German Ambassador in St. Petersburg had made, in passing, to Sazonoff three days before: measures of mobilization were highly dangerous nowadays, "for in that event the purely military consideration of the question by the General Staffs would find expression, and if that button were once touched in Germany, the situation would get out of control." The German Government takes very good care not to include in its White Book this self-confession, but the Austrian Government, with less prudence, reports it in No. 28 of the Red Book.

This is the kind of discussion which may gradually enlighten the masses in the Fatherland and change their attitude; then it may be that this war will be settled in the Reichstag and not on the battlefield.

CURRENT FICTION.

The High Priestess. By Robert Grant. New York: Charles Scribner's Sons.

Judge Grant here tells another story in the leisurely and formal, not to say stiff and long-winded, manner of "The Chippendales." Its material is quite the current thing—sex and The Sex. The heroine is an intolerably priggish and conceited Middle-Western young woman, who, having married a very decent sort of young man, becomes in her own mind a high priestess of the new cult of feminism. Equal rights and opportunities, a sharing of domestic responsibilities, independent pocket-books, a single standard of moral conduct, that is to say, misconduct—these are the principles upon which she founds her action, and, alas, her conversation. The stilted and school-ma'amly style in which the impeccable Mary is wont to lecture her long-suffering Oliver makes the gorge rise. It is hard to be patient with him for enduring so much.

Mary presently takes into her head to become a successful architect, and does so, to the tune of eight thousand a year. She has had no training, which only shows what women can do. To carry on her profession, she has to leave her children and husband largely in the hands of another woman, who is of the old-fashioned helpless clinging type. Oliver, his Minerva being otherwise engaged, in due season succumbs to the charm of his Eve. To be frank, it is hard to forgive Judge Grant for fetching Mary as it were by the scruff of the neck to be witness of the first embrace of the potentially guilty pair. However, that is what he does, and, of course, virtuous Mary is outraged, and takes herself and her children away from the contaminating neighborhood of Oliver, who really loves only her all the time. Years pass. There is no divorce, but Mary and Oliver live apart, and prosper apart, in a material sense. Oliver becomes Governor of his State. Finally he tires of the situation, and puts it plainly to Mary that unless she will take him back there is going to be a divorce and he is going to marry the former partner of his potential guilt. This fetches Mary; and the curtain goes down comfortably (for the reactionary spectator), with Mary "nestled there, her heart against his heart," and murmuring: "It seems that whether I was in the right or in the wrong, nothing counts any longer except that I love you, Oliver, and that you say that you love me. This must be because I am a woman after all."

Of course, there is no real dignity in this conclusion; the whole performance is artificial, and, alas, commonplace.

Nicky-Nan, Reservist. By "Q" (Sir A. T. Quiller-Couch). New York: D. Appleton & Co.

"Q" shows here one of his familiar Cornish fishing villages, but with war in the offing. "Nicky-Nan" is Nicholas Nanjivell, an aging fisherman disabled by a "growth" which he has done his best to conceal, but which becomes of use when war breaks out. For he has no interest in the war, takes it as a personal affront, and is glad to be released from his duties as a Naval Reservist on the score of his ailment. He learns that it can probably be cured, but prefers to suffer rather than be made eligible for service. Moreover, at the moment when the war breaks out he has discovered a hoard of gold, which gives him fresh interest in life. In short, he is the elderly egotist of all ranks and lands. The only thing that really concerns him is the sluggish maintenance of his infinitesimal "rights."

But there is good blood in Nicky-Nan, and this is the story of its awakening. To him among a mere handful in Polpier village comes at last the sense of duty to England; and we leave him going off, having made fair disposition of his treasure, to the operating-table, whence, if he survives, he is going to join the colors. It is grim duty, not glory or any fancied service of The Right, which leads Nicky-Nan. The spirit of the book is contained in the speech of the young volunteer who opens the eyes of Nicky-Nan:

> He swung about upon the elders upon the platform with an accusing finger. "We've got to go because you've brought this thing about, or have let it come about. It don't matter to me, much. . . . But we've to wipe up the muss; and if the young men must go an' wipe it up, an' if for them there's never to be bride-ale nor children, 'tis your doin' an' the doin' o' your generation all over Europe. A pretty tale, too, when up to a fortni't ago your talk was o' peace an' righteousness. . . . I'll fight well enough, maybe, when it comes to 't. But why were we brought up one way, to be tortured turnin' our conscience to another?"

It may be possible to call the book a recruiting-tract—a tract, however, from the hand of a master.

Tourbillon, or The King of the Whirlwinds. By Estelle R. Updike. New York: The Abingdon Press.

A fairy person who comes when the wind is high and whose head is made of an

electric-light bulb is a friend worth cultivating, as Pierre Renaud, alias Imp, found out to his joy one Christmas Eve. Especially comforting was he when he "put his hands on his thin sides and paced very slowly back and forth on the foot rail," hearing the Imp's troubles, and planning to send his messengers hither and yon upon all the winds that blow to bring help from over the sea. Especially delightful was it to know that up behind the lights of the great dome of the Post Office were stationed *all* the Tourbillons, looking down like Comic Spirits upon the windworn wayfarers of a winter's night. This is a charming book for children. And to those children who are tired of tinsel skirts and silver crowns, this new kind of fairy, made from a good thought, a bit of wind-whirled dust, and a good-sized pinch of lightning, will be a choice change.

A NEW EDITION OF WALTER MAP.

Walter Map. De Nugis Curialium. Edited by Montague Rhodes James. New York: Oxford University Press.

Walter Map, courtier, ecclesiastic, and wit, has given in his "De Nugis Curialium" not just what the reader expects, if he expects a complete picture of court-life in the reign of Henry II. There are incidental scenes of the court, but many other scenes, quite as interesting when one gets accustomed to the plan. At first there seems to be no plan in the medley of history, homily, and anecdote. Hoary legends and recent repartee, contemporary miracles and Classical myths, suggestions of the Arabian Nights and suggestions of the Decameron, attacks on heretics and on cardinals, tales of knight-errantry, goblins and devils, touches of drama both comic and tragic, worldly-wise ribaldry and childlike piety—all this and more one will find in Walter Map's scrap-book. He runs the gamut of the emotions as jauntily as Martial himself. Since the researches of Hauréau, scholars have hesitated to speak of Map as the author of the Goliardic poems, formerly attributed to him, but there are eminently Goliardic bits in the "De Nugis Curialium." If the work has a unity, it is not of contents, but of spirit. The author is not a mere collector of good stories; he is a satirist, observing mankind from a tower of contemplation. He is modern in temperament, that is, like Horace and other masters of the most effective satire, interested in the life about him rather than in the glories of a supposedly perfect past. Map might have called his work "De Nugis Omnium Hominum," adding, in the mediæval fashion, "et quibusdam aliis rebus."

We welcome a new edition of Walter Map, especially as the editor is the distinguished mediævalist, Dr. Montague James. As the work had been already published, however poorly, by Thomas Wright, its inclusion in the "Anecdota Oxoniensia" smacks rather of Dublin than of Oxford. There is but one manuscript extant, a Bodleian codex of the fourteenth century, two hundred years remote from the author's times, though a part of the book, the famous anti-matrimonial treatise entitled "Valerius ad Rufinum," was separately and anonymously circulated, and exists in numerous copies. It attracted the attention of various commentators, who attributed it to some Roman Valerius; Map's humorous prediction that remote posterity would number him with the ancient authors was fulfilled sooner than he knew. Dr. James's partial list of his alterations of Wright's text shows an incontestable advance. There are many puzzles still to solve. For instance, in the blurred passage on page 125, 17, *cuiusquam* should replace the unintelligible *antequam*, the two words looking very much alike when abbreviated.

The editor has studied Map's literary models with great care, printing the borrowed or quoted words in italics and giving in the margin the names of the authors from whom they are taken. Map gives the impression of one well-read in both the Classics and the Fathers, though Lucretius and Tacitus should probably not be included in the list. The "Vita Antonii" cited by Dr. James is doubtless that of St. Jerome, whose other biographies of hermits were known to Map. His acquaintance with Terence and with Virgil's Georgics is more intimate than is indicated in this edition; in one striking passage (p. 105, 23), a bit of the Georgics is immediately succeeded by a quotation from St. Paul—Map treats the poor Pagans as tolerantly as Dante, and, in fact, the Middle Ages in general did. He flings a phrase of Ovid's at the unhappy Waldensians, discomfited by him in theological debate; they tried, he says, like Phaëthon, to drive without knowing the names of the horses. His jibes at the Cistercians would have roused the envy of Pope, had the latter read this "classic of an age that knew of none." True to their precepts, Map declares, the Cistercians dwell in desert places, which, if they do not find desert, they make so. Their renunciation of life's pleasures is not wholly unproclaimed; like the pastoral Galatea, they "run to the copses and hope that they run not unseen." We are sometimes given to understand that mediæval writers quoted the Classics only to bolster up sound doctrine. There is really no difference in the practice of authors like Map and John of Salisbury, and, let us say, the contributors to the *Spectator* in the age of Queen Anne.

Map's style is a curious affair. In its best and simplest form, the rustic manner of which he was ashamed, it achieves something of the success of Chaucer, Boccaccio, and the master of them all, Ovid. Too often, however, Map follows that path of rhetorical complexity which, starting in the Roman empire with Apuleius, Sidonius, and Martianus Capella, led to a *reductio ad absurdum* in the amazing hieroglyphics of the "Hisperica Famina," only to continue its course in later writers of prose. Assonance, antithesis, and involution are its essence; its highest art is to combine a pun and a contrast in an unintelligible phrase. Map has hundreds of puns; wit is an accident and sound the substance of their being. Artificiality is also apparent in the rhythmical tags which end not only sentences, but clauses. This is the clue to the elaborate punctuation in the manuscript which Dr. James notes, but which he does not adopt in his own text. Perhaps it is well, at the expense of veracity, to conceal this tasteless adornment and let the many interests of the "De Nugis Curialium" speak without hindrance to the modern reader. We can forgive anything, especially at the present moment of international complications, in the author who preserves the following utterance of a French courtier.

"Kings have their differences," the latter declared. "The Byzantine Emperor and the King of Sicily boast of their gold and cloth of silk, but have no men who can do aught but talk. The Roman Emperor, as the ruler of the Germans is called, has men well-armed and steeds of war, but not gold or silk or any other wealth." (Kultur was not yet introduced.) "The English King lacks nothing; not men or steeds or gold or silk or gems or fruits. We in France have only bread and wine and the *joie de vivre*." "I noted that saying," adds Map, "for it is both witty and wise."

SEVEN MILLION COUNTRY GIRLS.

The American Country Girl. By Martha Foote Crow. New York: Frederick A. Stokes Co. $1.50 net.

Martha Foote Crow calls attention to the singular fact that, while there have been tons of paper devoted to the farmer, reams filled on the farm woman, together with a volume about farm children, hers is the first book about the country girls of America, of whom there are some seven millions between the ages of fifteen and thirty. They surely deserve special consideration, not only because of their great number, but because on their attitude depends the future of American farming. What will become of our six million farmsteads if an ever-increasing proportion of these girls should follow their brothers cityward, as they seem inclined to do? Can this calamity be averted? The author thinks it can, and in thirty chapters she sets forth her ideas as to how country life can be made so attractive to the girls that the lure of the city will cease to mislead them. She shows how success has been won by many women in *manning* the farms—doing all the work themselves; but the better way is for them "to *woman* them, to *lady* them, to *mother* them, and so make them centres of wholesome, interesting life that, if the girls do their part, shall be the very heart and fibre of the nation." We are naturally "a country-life people"; the bogey of the all-absorbing city has frightened us, and started the "Country-Life Movement." The present volume, if widely read, will do much to help along that movement.

Having concluded that just now no information is so important as the answer to the question: "Is the country girl happy?" the

author set about to get answers to that question from the girls themselves. Prof. Martha Van Rensselaer, of Cornell University, kindly shared with her some of the results of a questionnaire on The Young Woman on the Farm, which was sent out by the Home Economics Department of that University; and much additional direct testimony came to the author herself, so that the chapters concerned with this question constitute a sort of composite photograph—a glimpse of the real life of girl workers on farmsteads. It is encouraging to note how many of the girls, though hard-worked, enjoy their life. In their vivid accounts of their everyday doings one comes frequently across phrases like "We often declare that we would not live in the city for anything"; "If some university can help me to make my days more elastic, so that they can compass all my joys comfortably, I shall be glad." Other girls dwell on their love of farm animals, of flowers, of their scenic surroundings, their excursions and social gatherings, and so on, giving the impression that in their cases the joy of work and the joy of living are inseparable. The homesteaders in the Far West love their wild surroundings and are not oppressed by a sense of loneliness. "I do not think we miss the outside world," writes a young woman from Wyoming, "as there is something about this country that, after a time, fills one's whole thoughts, and it is hard to remember that there is any other world than this."

There is, of course, another side, which affects the composite portrait of the country girl. One of the cases referrred to is that of a young girl a mere list of whose daily chores takes up nearly two printed pages. There are not a few cases like it, and the author truly remarks that it cannot be well for a nation that girls should be required to endure such strains as the one referred to: the "sixteen-hour day of unremitting, heavy, and exacting work imposed upon a young girl between the ages of thirteen and seventeen, in one of the largest and most prosperous farming States of this country." The girl in question escaped a breakdown by running away—which is what will happen in increasing numbers unless conditions are remedied and the happiness of country-workers scientifically striven for. "The drudgery point must be reduced till labor becomes a joy" to all. The trouble at present is that the scientific labor-saving devices have mostly been applied in the field and the barn, the workshop of the woman being still the worst in the world. Lists are given of labor-saving devices that would help. The author may be too sanguine in expecting that the time now spent on dish-washing and other household drudgery may be reduced from eighteen hours to two hours; but a great deal can be done to secure leisure for the rest, reading, social intercourse, and entertainments needed to make country girls happy. There are chapters here on each of these aspects of the question, and on others, such as health (with concise rules), dress, wages, etc.

One of the main reasons for the cityward procession of girls is that on the farm they get no wages. They hear of city workers receiving from $6 a week up, and, in complete ignorance of what that means in the way of drudgery, privation, temptation, and lack of health and happiness, flock to town, where, in place of the spacious farm-house, they have for their home the "hall-bedroom of that tragic book, 'The Long Day,' which so painfully portrays the conditions of work for girls in a great city. The Country Girl in her home, with her housework about her, is in a paradise compared with conditions such as these." The author severely censures parents, teachers, and ministers for neglecting to impress this fact on the minds of country girls, thousands of whom might easily be kept where they are most needed, and most likely to be happy. The facts gathered between the covers of this book will make it clear to any bright girl that there is a career for one like her in the country as well as in the city; and that, so far as happiness is concerned, "there is a forbidding solitariness in the city that is to that of the country as a desert is to a garden." If money is essential to happiness, the country girl, with her vegetable gardens, her canning clubs, her chickens, her cows and dairy products, and the prizes to be won, now has abundant and ever-increasing opportunities to earn her pocket-money and much more. Interesting details are given regarding a Southern girl of fifteen who won several prizes with her garden and dairy products and had free trips to the Pacific Coast and to Washington, where she was presented to the President's wife.

SOCIAL-DEMOCRATS AND THE INTERNATIONAL.

Le Groupe socialiste du Reichstag et la Déclaration de guerre. Par P.-G. La Chesnais. Paris: Armand Colin. 1 fr. 50.

The attitude of the German Social Democrats during the preliminaries of the war, and especially the conduct of the representatives of the party in voting the war credits in the Reichstag, M. La Chesnais has made the subject of a keen investigation. This little book furnishes some interesting documentary evidence which it is difficult to obtain elsewhere. The author, who is himself a Socialist, has gone for much of his material to the files of the *Vorwärts* of Berlin and the *Arbeiter-Zeitung* of Vienna. The citations from these newspapers are numerous and at times lengthy. Where the reviewer has had opportunity to compare them with the originals, he has found that the latter have been faithfully rendered in the French translations. Also much valuable information is divulged concerning the proceedings of the Socialists at international conferences, in party caucuses, etc.

It is M. La Chesnais's firm conviction that the Social-Democratic party in Germany, through its support of the war, has betrayed the principles of the International. The discrepancy between its vigorous opposition to the war-policy of the Government up to July 31 (the date of mobilization) and its servile acquiescence after the die had been cast, is too glaring to be explained away by specious reasoning.

The evidence in M. La Chesnais's indictment may be summarized as follows:

(1.) Up to August 1 the *Vorwärts* attacks the German Government trenchantly for its attitude in the Austro-Servian crisis. Its columns bristle with arguments which partisans of the Allies have since employed in all countries. Thus, the ultimatum to Servia is denounced as brutally offensive, and as inspired by a desire to provoke war; it is pointed out that Russia will naturally feel called upon to come to the aid of her Slavic kinsmen; the pacific intentions of the English and French Governments are freely recognized; the German Government is exhorted to accept the suggestion of Sir Edward Grey for a conference of the Powers—"the decision depends on William II"; finally, as a forlorn hope, it is almost feverishly urged that the Russian mobilization is not to be regarded as a reason for breaking off negotiations. Meanwhile the *Arbeiter-Zeitung* of Vienna was arguing in a similar vein.

(2.) On August 1, Müller, a member of the executive committee of the Social-Democratic party, appeared unexpectedly in Paris to confer with his French colleagues on the attitude which the Socialists in both countries should adopt in view of the impending war. Müller stated most explicitly that the German parliamentary group would either vote *against* the war credits, or would abstain entirely from voting. About the same time (the exact day is not specified) the German Socialist Deputy Haase informed Bethmann-Hollweg that the Socialists could not vote for the war appropriations, to which the Chancellor replied that he understood perfectly the embarrassing position the party was in.

(3.) Hermann Wendel, editor of *Vorwärts*, is authority for the statement that, previous to the opening session of the Reichstag on August 4, a member of the Government had a secret interview with several leaders of the Socialists, in the course of which he succeeded in persuading them, by the exhibition of certain "documents," that Germany was being attacked. Liebknecht afterwards told the Belgian Socialists that he personally had no knowledge of either the interview or the "documents." Apparently, the member of the Government chose his Deputies prudently and enjoined discretion upon them. It would seem as if the German Socialists had been caught by an appeal to their patriotic instincts and to their hatred of the Russian Government.

(4.) In the party caucus only a small minority (the author estimates the number at fourteen) held out for opposition to the war. The overwhelming majority swung into line with the Government policy. Since the party, by its own rules, was forced to vote as a unit in the Reichstag, Germany

was able to present to the world the appearance of a solidly united nation. The tergiversation of the Socialists was complete; their moral collapse being the more tragic inasmuch as the voting of the first war credits coincided with the Chancellor's announcement of the violation of Belgian neutrality and with the miserable plea, "Necessity knows no law." Since then the tone of certain of the party leaders has grown apologetic; there seems to be at least an undercurrent of feeling that the party was hoodwinked by the Government; also, as is well known, Liebknecht broke party discipline by casting his vote in the Reichstag against subsequent war credits. On the other hand, Südekum has become a Government agent and David an avowed militarist, while the rank and file of the party seem to have merged themselves indistinguishably in the nationalist masses. M. La Chesnais thinks that the whole party organization should be read out of the International.

This pregnant little volume may be recommended to all who are interested in the beginnings of the war, and especially to those who have read Mr. Walling's recent attempt to rehabilitate the reputation of the German parliamentary group.

Notes

"Paris Reborn," a new book by Herbert Adams Gibbons, will shortly appear from the press of the Century Co.

"The Road to Glory," by E. Alexander Powell, is announced for immediate publication by Charles Scribner's Sons.

Houghton Mifflin Co. announces for publication next month "The Song of the Lark," by Willa Sibert Cather, and "America at Work," by Joseph Husband.

John Masefield's "The Faithful" is announced for publication on September 29 by the Macmillan Co.

Henry Holt & Co. announce for publication on October 2 "The Essentials of French Pronunciation," by Barry Cerf, and "Contes Français," by D. L. Buffum.

Doubleday, Page & Co. announce the forthcoming publication of "Secret History as Revealed by Lady Peggy O'Malley," by Mrs. Alice M. Williamson. The same house will publish next month in the Drama League Series of Plays "The Trail of the Torch," by Paul Hervieu; "A False Saint," by François de Curel; "The Apostle," by Paul Hyacinthe Loyson; "A Woman's Way," by Thompson Buchanan, and "My Lady's Dress," by Edward Knoblauch.

Frederick A. Stokes Co. will bring out in October the following publications: Anna S. Walling's "Violette of Père Lachaise"; Jethro Bithell's "Contemporary Belgian Literature"; Arthur Gleason's "Young Hilda at the Wars"; Arthur Hoeber's "The Barbizon Painters"; "A History of Babylon," by Leonard W. King; "Lord of Misrule and Other Poems," by Alfred Noyes; "Germans and Africa," by Evans Lewin; "Spies and Secret Service," by H. Grant; "Chats on Military Curios," by Stanley C. Johnson; "Grandmother's Fairy Tales," by Charles Robert Dumas; "Toy-Making at Home," by Morley Adams, and "Wonderland of Egypt," by Percy R. Salmon.

The following volumes are included in the autumn list of B. H. Blackwell, of Oxford, England: "Tales by Polish Authors," translated by Else C. M. Benecke; "Still More Russian Picture Tales," by Valéry Carrick, translated by Nevill Forbes; "Life of Viscount Bolingbroke," by Arthur Hassall; "An American Garland, Being a Collection of Ballads Relating to America, 1563-1759," edited with introduction and notes by C. H. Firth; "Oxford Poetry, 1915," edited by G. D. H. C. and T. W. E.; "The War and Religion," by Alfred Loisy, translated by Arthur Galton; "Syria as a Roman Province," by E. S. Bouchier; "Analysis of Mill's Principles of Political Economy," by L. Oldershaw; "Historical Geography of England," by Maud Holliday; "Symphonies," by E. H. W. M.

The final arrangements for the celebration of the centenary of the birth of Richard Henry Dana, jr., popularly known as the author of "Two Years before the Mast," have now been made, and promise an occasion of unusual interest. It will take place in Sanders Theatre, Cambridge, under the auspices of the Cambridge Historical Society, and the date is Wednesday evening, the 20th of October next, instead of the 27th of October, as originally planned. Bishop Lawrence will preside. Prof. Bliss Perry, of Harvard College, will speak of Mr. Dana's literary career, with special reference to "Two Years before the Mast." Mr. Moorfield Storey, of the Suffolk Bar, will speak of Mr. Dana's anti-slavery work, and Hon. Joseph H. Choate, of New York, formerly Ambassador to England, will deal with Mr. Dana's career in international law.

Hilaire Belloc's fancifully philosophic book of foot-travel, "The Road to Rome," which appeared in 1902 from an English press, is now published in its first American edition by Putnams ($1.50 net). The high spirits and intimate tone of this narrative of a trip across Lorraine, the Jura, Switzerland, and Lombardy and Tuscany have apparently commended it, in spite of its frequently trivial by-play, to a steady demand. The new edition reproduces the sketches made by the author on the march.

The various aspects of journalism, editorial and financial, metropolitan and rural, were the subject of a conference at the University of Kansas a year ago. Addresses delivered upon that occasion, together with other material, are embodied in a volume called "The Coming Newspaper," edited by Merle Thorpe, of the Department of Journalism at the University (Holt; $1.40 net). One of the topics, Tainted Journalism, Good and Bad, is treated by Washington Gladden, who makes a sober but pointed presentation of the tendency of newspapers to exaggerate, even to the extent of gross distortion of the facts, and to "play up" the "seamy side" of life. He illustrates the latter habit with an incident in his own experience. A letter which he sent to his parishioners, to prepare the way for the coming of a colleague who had been appointed at Dr. Gladden's request with the understanding that he would become Dr. Gladden's successor, was made the occasion for a sensational story, telegraphed everywhere by the Associated Press, of dissatisfaction and desertion by his congregation and discouragement in him. His prompt correction of the tale has not travelled with the speed of the original, and he finds himself the object of pity wherever he goes. Other subjects discussed are Some Weaknesses in Modern Journalism, by Oswald Garrison Villard; The Clubber in Journalism, by Isaac D. White, of the New York *World;* Unto Whomsoever Much Is Given, by Melville E. Stone; A Modern Type of Country Journalism, by Ralph Tennal, of the Atchison *Globe,* and A Code of Ethics for Newspaper Men, by James Melvin Lee, head of the Department of Journalism of New York University. The weak part of the book is its treatment of Government regulation of the press—weak, not because of a jealous attitude of "hands off," but, surprisingly enough, for a contrary reason, an advocacy of such impossible leading-strings as signed news-items and State licenses for newspaper men!

John Boynton Kaiser has energetically compiled what seems to be a very practical reference book on the topics mentioned in his title, "Law, Legislative and Municipal Reference Libraries" (Boston Book Co.; $4). The result is a volume which will be necessary to anybody making a study of these specialized subjects, but which, it must be confessed, is rather formidable in appearance, even to those whose interest is more than a layman's. Mr. Kaiser's method is that of the topical outline, followed by text. The fact that it requires nearly a page of fine print to explain the index (to a volume of about 400 pages) indicates how extremely careful, not to say fussy, the author has been.

Literature as a narcotic should surely have its innings in these troublous days. They are not few who would flee far away from the vain conjectures of treaties and campaigns and the unending, indecisive succession of bloody attack by deadly repulse. An escape is offered in "From the Shelf" (Dutton; $1.50 net), by a young writer who styles himself Paxton Holgar. Under impulse of disappointment he hurries from London, shakes the dust of England from his feet, and soon by chance is installed in a deserted monastery on a Spanish isle in the Mediterranean. The wholesome charm of the native life in this out-of-the-way corner of the world, the quiet contentment with his rude but tropically luxuriant surroundings, are reflected in the simplicity of the narrative. Indeed, the seeming artlessness of his recital wins from you an ingenuous belief in the reality of his experiences. You catch the twinkle in his eye as he recalls the round, full-moon-like face of Fausto, his food-bringer, or describes Appollonia, his caretaker, "a shrivelled creature, the merest wisp of a woman, and of incredible age." You follow him guilelessly during the year through more than one refreshing experience, and you almost accept his "Adiós" wherein he triumphantly returns to England with a flush of romance on his cheek and on his lips a promise to return to his sunny, languorous shelf.

The newest official in our polity, the city manager, is the hero of Oswald Ryan's "Municipal Freedom," one of the American Books

series (Doubleday, Page; 60 cents net); of Harry Aubrey Toulmin, jr.'s, "The City Manager," one of the National Municipal League series (Appleton; $1.50 net), and of a Bulletin of the University of Texas by Herman G. James, "What Is the City Manager Plan?" All three view the city manager with admiration. Of the two books—the Bulletin is a pamphlet—Mr. Toulmin's is the more comprehensive and detailed, Mr. Ryan's the more critical. Mr. Toulmin quotes at length from reports and statutes bearing upon the city-manager form of government, and even gives a glimpse of European municipal arrangements. Mr. Ryan ventures to criticise so perfect a document as the Dayton Charter. Instead of believing in the divine nature of the recall, as is the tendency of advocates of any variety of commission government, he regards this provision as "a violation of the central principle of this type of municipal organization," the principle that the city manager is not a political official, charged with the determination of policy, but a permanent, non-political official, in a word, an expert, whose business is the execution of the will of the city as expressed by the representative body which appoints him and to which he is responsible. The argument that he should be subject to popular recall is an argument that he should be popularly chosen. All of these publications are provided with good bibliographies. None of them, however, performs adequately the service that is most needed in connection with both commission government and the city manager—a critical estimate of gains and losses so far resulting from the adoption of these changes in our method of conducting municipal affairs.

"German Culture, Past and Present" (McBride, Nast; $1.25 net), by Mr. E. Belfort Bax, an English Socialist, is hardly, as the title would indicate, a comparison between the old-fashioned cosmopolitan culture of the Germany of Kant, Goethe, and Beethoven and the aggressive nationalism of the modern militaristic state. It is rather, for the most part, a monograph on German civilization in the sixteenth century, with special reference to the peasants' wars and other social and economic phenomena. The author, as a good Socialist, believes in the materialistic interpretation of history, and accordingly belittles the spiritual factors in the Reformation, besides having much to say in disparagement of Luther as a man and a thinker. The last two chapters, which have evidently been written since the beginning of the war, have no organic connection with the rest of the book. They deal with the Prussianization of Germany through the Hohenzollern policy of appropriation and autocracy.

In Mary Ritter Beard's "Woman's Work in Municipalities" (Appleton; $1.50), it is somewhat difficult to see the forest for the trees. Generalizations there are, but they are so very general that almost anybody might make them. The usefulness of the volume, upon which a vast amount of labor has evidently been spent, is, therefore, limited to that which pertains to an ordered collection of cases. One receives the impression of manifold activities in a dozen fields, education, public health, correction, civic improvement, and so on, but at the end is left with the unanswered question, Just what has woman brought to municipal service? Of her contributions we are told; we are not informed of her contribution. A more serious criticism is necessary of the final chapter, Government and Administration. Women have been voting in various cities for a good many years. Yet a third of the chapter is given up to the results of a single election, that of the spring of 1914 in Chicago and Illinois, in accordance with Graham Taylor's dictum at the time, "Illinois and Chicago give the country the most significant test of women's voting"—which may have been true enough when applied to one single series of elections. Then comes a copy of a telegram to a Chicago newspaper concerning an election at Des Moines, and this is followed by an editorial printed ten years ago in a California newspaper, entitled, "Why Women Should Be in Municipal Offices." The gross superficiality of this treatment of a great question is especially disappointing in the face of the real need for a critical estimate of woman's part in the government of those cities where she has had the ballot. So inadequate a method of procedure as is here exemplified will merely confirm anti-suffragists in their skepticism of the value of the vote in the feminine hand.

Alive to the splendid possibilities, the Minnesota Historical Society is about to take a more important part in the field of history and related activities than ever before. The Society is to have a handsome and convenient building. Dr. Solon J. Buck, the recently appointed superintendent, has many plans for the future which, if realized only in part, will greatly increase the Society's usefulness. Minnesota has not kept pace with neighboring States in some departments. It is therefore proposed to encourage the formation of local historical societies, and thus to create, so far as possible, a desire on the part of the people for the adequate treatment of their local history and the preservation of historical landmarks. And, too, there is to be coöperation with the University of Minnesota, which ought to result in good for both institutions, as well as for the State generally. Plans for future publishing activities are forming. One notable change should be mentioned: hereafter the Society's "Collections" will be reserved for documentary materials bearing primarily on the State's history. The numerous papers and reminiscences which have heretofore found a place in these volumes will be printed in a "Bulletin," two numbers of which have already appeared. This is a marked improvement.

Volume XV of the Minnesota Historical Society "Collections" (St. Paul), edited by Mr. Warren Upham, the former secretary, has recently come from the press. This volume of nearly 900 pages contains much matter of interest and value, but nothing that gives it the mark of distinction. Rasmus S. Saby contributes a lengthy thesis on "Railroad Legislation in Minnesota, 1849-1875," in which the facts are well digested. The study will prove helpful, as will also Mr. Iverson's paper on "The Public Lands and School Fund of Minnesota," and Prof. W. W. Folwell's account of "The Five Million Loan." Of reminiscences there are a goodly number, some of which are attractively written and worthy of preservation in print. Many pages are devoted to memorial addresses, the most interesting being Olin D. Wheeler's review of the career of Nathaniel P. Langford, the Vigilante and explorer, whose name will always be gratefully associated with Yellowstone Park. There is also the voluminous report of the committee appointed by the Society to pass upon the authenticity of the so-called Kensington Rune Stone, the "fake" which caused a flutter in certain circles some years ago. The favorable conclusions of the committee will not be generally accepted by those who have given the facts careful consideration.

"Narratives of the Insurrections, 1675-1690" (Scribner; $3) makes Volume XVI of the excellent collection of sources for colonial history edited by Dr. J. Franklin Jameson under the general title "Original Narratives of Early American History." Prof. Charles M. Andrews, of Yale University, who edits the present volume, has performed his task in the highly satisfactory manner which his previous work would lead students of colonial history to expect. The notes are sufficiently numerous to explain the text; the general introduction gives a brief estimate of the value of the material and enumerates the chief general causes of the insurrections; while the special introductions to each narrative give the essential information, in so far as it is obtainable, of a bibliographical character. Needless to say, not all the narratives are printed here. There are three each for Bacon's and Leisler's rebellions, eight for the disturbances in New England, and one each for North Carolina and Maryland. With the exception of the Letter of Captain George to Penys, which is for the first time printed in full, and of the Declaration of Protestant Subjects in Maryland, which was printed as a pamphlet in London in 1689, the narratives in this volume were already fairly accessible to students of colonial history. But the various insurrections, though they owed much to local causes, were influenced by conditions that were general, and it is therefore well to have the chief sources for the movement as a whole brought together. The history of individual colonies has been studied at the expense of what might be called comparative colonial history, and if the present volume does something to help students and teachers to grasp the unity of colonial development it will have been amply justified. Apart from these considerations, there are very many teachers of history who do not have access to libraries that are in any sense adequate; to them such collections as the one which is now nearing completion should prove of the highest value.

Ezra Ripley Thayer, dean of the Harvard Law School, committed suicide at Cambridge on September 15, while temporarily insane. He was born at Milton, Mass., February 21, 1866. Mr. Thayer was a son of the late James Bradley Thayer, for nearly thirty years professor of law at Harvard and a scholar of international distinction in the fields of legal history and constitutional law. Another son of Professor Thayer is Dr. W. S. Thayer, professor of clinical medicine at Johns Hopkins. Before entering college, Ezra Thayer travelled and studied in Greece as the companion and pupil of the late Prof. W. W. Goodwin. Mr. Thayer received the degree of A.B. from Harvard College in 1888, and that of A.M. in 1891. In the latter year he graduated from the Harvard Law School, with a record very rarely approached in the institution's history, and was admitted to the bar of Suffolk County, Massachusetts. Mr. Thayer's essay on "Judicial Legislation: Its Legitimate Function in the Development of the Common Law" won the medal given by the Harvard Law School

Association in 1891. The year 1891-2 he spent in Washington as the private secretary of Justice Gray, of the United States Supreme Court. Upon his return to Boston he entered active practice, and before long became a recognized leader among the younger members of the bar. In 1910 Mr. Thayer was elected dean of the Harvard Law School, succeeding the late James Barr Ames, and becoming at the same time Dane professor of law. He had previously been connected with the institution only in the capacity of an occasional lecturer on Massachusetts Practice. Besides discharging the duties of his administrative office, Dean Thayer gave the courses in "Torts and Evidence." In December, 1913, Gov. Foss of Massachusetts nominated him to fill a vacancy in the Supreme Judicial Court. Mr. Thayer felt, however, that he could render his best service to the community in the position he held, and declined the appointment. Dean Thayer spoke and wrote with rare grace and force. His speeches at students' and graduates' gatherings were notable in form and substance—terse, direct, and glowing with the high enthusiasm of a nature at once modest and in the best sense proud. Alike in his distinguished physical presence and in the variety of his intellectual tastes and talents—above all, perhaps, in the elevation of his standards of scholarship and teaching—Mr. Thayer reminded those who had known both men of his father. His classes felt that Dean Thayer, too, was, as John Chipman Gray called him, "the best type of New Englander."

Science

The books on elementary science may be divided into two groups, the first group comprising those which are designed to impart information chiefly, and the second those which attempt to give some clear idea of method. There are a few books which endeavor to combine these two purposes by presenting hints for a laboratory course. Among the most successful of these may be mentioned "A First-Year Course in General Science," by Clara H. Pease (New York: Charles E. Merrill Co.). Miss Pease has evidently been careful in her compilation, and she has brought within a narrow compass an immense mass of facts. For the most part, the statements are presented in an attractive manner, and constitute, taken as a whole, a convenient little handbook of the most elementary science, ranging from astronomy and celestial physics down or up to human digestion.

"Marvels of Insect Life" (R. M. McBride; $3.50 net), by Edward Step, F.L.S., is well adapted to the kind of reader aimed at—the person who, though quite ignorant of entomology, is ready to believe that the study of insects is fascinating. The dozen colored plates and the 636 drawings and reproductions from photographs would almost suffice, without the text, to convince the unenlightened that a new world of wonder and delight is theirs for the asking—and a little work. The illustrations are indeed notable, in excellence as in quantity. Many of them, such as that of the Giant Water-Bug Attacking a Frog, have a spectacular effect that should make them particularly attractive to the young reader. The text will serve for young and old alike; it is colloquial, unadorned, and frankly clumsy. Although the insects discussed are not confined to any one section of the world, the preference is always given to British insects, and consequently the book will hardly be so interesting and useful for American as it will be for British readers.

A number of books have appeared in the last few years dealing with the general subject of the economic and sanitary importance of insect-life. Some of these books have been meant for the specialists and some have been prepared for popular use. Prof. C. A. Ealand's book, "Insects and Man" (Century; $3.50 net), seems to strike in between these extremes. It contains a great deal of very interesting material that will be appreciated especially by readers who have some scientific training, but are not specialists in entomology. The object of the book is to show that there is a real struggle for existence between man and the insect-world. If the latter were not a "house divided against itself" it is the author's opinion that the "human race would be extinct in five or six years." It seems probable that the story told by this and similar books will reach a wide circle of readers and will result eventually in focussing the attention of civilized man upon the necessity of applying human intelligence to a sustained and systematic fight against these myriads of minute enemies that are responsible for so much destruction to property and to life.

The range of subjects in Anna Botsford Comstock's "The Pet Book" (Comstock Publishing Co.; $2.50 net) extends from mammals to meal worms. The general treatment is very uneven, and considering the very competent sources from which the author has derived her facts, the information is not infrequently meagre and ill-balanced. But the directions as to the care of dogs, ponies, calves, lambs, rabbits, and the more common birds will doubtless be useful to many children who have no access to more detailed works. The most valuable portion presents evidence of the value as pets of such creatures as skunks, flying-squirrels, bats, blue-jays, terns, toads, newts, lizards, and bees. Here the conventional field of pets is widened, and this alone would furnish a *raison d'être* for the book. The illustrations, with the exception of the frontispiece, are poor, suffering both from choice of subject and uncoated paper. The text is heavy, being little else than a continuous succession of unvarnished facts and statements. This unliterary quality, however, facilitates reference, and this is the main object of the book.

In a well-printed book of a couple of hundred pages, Mr. Royal Dixon has brought together a large number of the more interesting facts in regard to the behavior of plants. He has given to his work the sensational title, "The Human Side of Plants" (Stokes; $1.50 net), and he starts out with the statement that he is "blazing the trail." It has been rather difficult, however, to detect, in the great mass of good material which he presents, any important facts which are now published for the first time. But this does not impair the usefulness of the book as a pleasing and, on the whole, trustworthy description of the innumerable adaptations of plants to their surroundings. One could wish that the language might have been freed a little more from fine writing and sensational expressions. The photographic reproductions are excellent, and the four pictures in color, by Mrs. Ellis Rowan, are worthy of high praise.

Drama

PINERO'S NEW SATIRE, "THE BIG DRUM."

By WILLIAM ARCHER.

LONDON, September 2.

It was hard to believe, at the St. James's last night, that England was in the second year of a huge and terrible war. The scene had all the "brilliance," such as it is, and all the gayety, of all the St. James's first-nights for five-and-twenty years past. Here and there was a figure in khaki, but they were fewer than is now usual on such occasions. From the author downwards, every one seemed to have conspired to shut out for three hours all thought of the war. It is true I overheard the lady next me say, "I have two sons at the Dardanelles"; but the thought did not seem in the least to mar her enjoyment of Sir Arthur Pinero's extraordinarily interesting comedy.

"The Big Drum" is a satire—perhaps a little fiercer than the subject demanded—upon the pushing, "booming," notoriety-hunting snobbishness of British society. It might have been called "The Climbers" had not Clyde Fitch preëmpted the title. It also deals with the booming of literature—a subject as old as Scribe's "Le Puff," but none the less actual on that account. Perhaps it might have been wiser to treat the theme lightly throughout, and not make a happiness-wrecking vice of what is, after all, no more than a ridiculous folly; but the play is so adroitly built, and takes, from the first, so firm a hold upon our interest, that it is only in retrospect that we feel any sense of disproportion.

Ten years before the action opens, Philip Mackworth was a journalist in Paris. He fell in love with Miss Ottoline Filson, daughter of a wealthy British parvenu, who was then trying to buy his way into French society. Mackworth and Ottoline were deeply attached to each other; but they fell out over the climbing propensities of the Filson family, and Ottoline married an undesirable French count. Repulsed in Paris, the Filsons laid siege to London with better success; and when the play opens, Ottoline, now a widow, has joined them in Ennismore Gardens. She meets Mackworth at a luncheon party, and instantly there occurs a belated "redintegratio amoris"; for, indeed, they have never ceased to love each other. But Mackworth has misgivings as to the wisdom of attempting to re-knit the broken thread:

Philip: What would be the result of your reviving a friendship with an ill-tempered, intolerant person, who would be just as capable to-morrow of turning upon you like a savage——?

Ottoline: . . . As you did that evening, for instance, when I came with Nanette to your shabby little den in the Rue Soufflot——

Philip: Precisely.

Ottoline: To beg you to *prôner* my father and mother in the journal you were writing for—what was the name of it?

Philip: The *Whitehall Gazette.*

Ottoline: And you were polite enough to tell me that my cravings and ideals were low, pitiful, ignoble!

Philip (regretfully): You remember?

Ottoline: As clearly as you do, my friend. Besides, they were true, those words—hideously true—as were many other sharp ones you shot at me in Paris.

Mackworth's misgivings are soon overcome, for the truth is Ottoline is passionately devoted to him. But she is rich; he has only a pittance, and the novels he writes bring him in a very small income. It is not so much the ordinary money scruple as the sense of being a failure in his art that leads him to insist that their marriage shall be delayed till after the appearance of his next novel, in which he has a profound belief. She reluctantly agrees, not without a painful realization that pride and literary ambition are more to him than love.

Then comes the ordeal of breaking the news of the engagement to Sir Randle and Lady Filson and their hopeful son, Mr. Bertram Filson. This snob trio cannot but recall the Puritan trio of the Ridgeleys in "His House in Order"; but the Filsons are less ferociously handled, without being a whit less amusing. Sir Randle and his wife, indeed, are not at all bad-hearted people. They would be an excellent, affectionate bourgeois family, if they did not happen to be colossal snobs. Sir Randle, a tall, heavy, pompous man, with a head like that of Alexandre Dumas *fils*, has just come in from a memorial service in honor of a man he didn't know:

Lady Filson: You haven't been long, Randle.

Sir Randle (a cloud overshadowing his face): I didn't remain for the Dead March, Winnie *(taking off his black gloves.)* I need hardly have troubled to go at all as it turned out.

Lady Filson: Why, dear?

Sir Randle: The sad business was most abominably mismanaged. No reporters.

Lady Filson: No reporters!

Sir Randle: Not a single pressman in the porch. . . . I am almost glad, under the circumstances, that I didn't regard it as an event that laid me under an obligation to send flowers.

An Irish baronet, Sir Timothy Barradell, is at this moment having an interview with Ottoline in her boudoir, and the result is breathlessly anticipated by her parents, in spite of the fact that Sir Timothy has made his money out of bacon:

Lady Filson: It won't *sound* bad, Randle.

Sir Randle (leaning back in his chair and closing his eyes): "Lady Barradell."

Lady Filson (in the same way): "Lady Barradell."

Sir Randle (in a murmur, but with great gusto): "A marriage is arranged, and will shortly take place, between Sir Timothy Barradell, Bart., of 16 the Albany and Bryanstown Park, County Wicklow, and Ottoline, widow of the late Comte de Chaumié, only daughter of Sir Randle and Lady Filson, of 71 Ennismore Gardens, and Pickhurst, Bramsfold, Sussex."

Great is their disgust when Sir Timothy, an original, delightful character, appears with the information that Ottoline has sent him about his business; and it rises to consternation when Ottoline herself announces that "a marriage has been arranged" between herself and an obscure novelist who, to Sir Randle's unspeakable dismay, does not even figure in "Who's Who?" The interview between Mackworth and the Filson family is a painful one; but Mackworth somewhat reconciles them, and goes near to alienating Ottoline, by saying:

Well, Sir Randle, I—I'm prepared to take a sporting chance. . . . I'll stake everything on my next book! I give you my word that if it isn't a success—an indisputable, popular success—I will join you both, in all sincerity, in urging Ottoline to break with me. Come! Does that mollify you?

The Filsons naturally inquire into the nature of the work on which he builds such hopes; and Ottoline, irritated by this new proof of his postponement of love to pride, eggs him on to give an account of it, though she knows that she is mounting him upon his hobby:

Philip: It's called "The Big Drum," Sir Randle.

Sir Randle (elevating his eyebrows): "The Big Drum"? *(With an innocent air)* Military?

Philip: No, social. . . . It's an attempt to portray the struggle for notoriety—for self-advertisement—we see going on around us to-day.

Sir Randle: Ah, yes, lamentable!

Philip (deliberately, but losing himself in his subject as he proceeds): It shows a vast crowd of men and women, sir, forcing themselves upon public attention without a shred of modesty, fighting to obtain it as if they were fighting for bread and meat. . . .

Sir Randle (closing his eyes): A terrible picture!

Lady Filson (closing her eyes) Terrible!

Philip: It shows the bishop and the judge playing to the gallery, the politician adopting the methods of the cheap-jack, the duchess vying with the puffing draper; it shows how even true genius submits itself to the conditions that are accepted and excused as "modern," and is found elbowing and pushing in the hurly-burly. It shows how the ordinary decencies of life are sacrificed to the paragraphist, the interviewer, and the ghoul with the camera; how the home is stripped of its sanctity, blessed charity made a vehicle for display, the very graveyard transformed into a parade-ground; while the outsider looks on with a sinking of the vitals because the drum-stick is beyond his reach and the bom-bom-bom is not for *him!* It shows—*(checking himself with a short laugh).* Oh, well, that's the setting of my story, Sir Randle. I won't inflict the details on you.

The next act occurs at Mackworth's chambers in Gray's Inn, four months later. It is characteristic of the literary tradition which Sir Arthur Pinero represents that portraits of Dickens and Thackeray are prominent among the novelist's household gods. "The Big Drum" is published, and after hanging fire at first, has made a great success. The publisher reports a sale of 25,000 copies—you see how modest are our English notions of a "best-seller." Mackworth is overjoyed to have found recognition at last, the Filsons are reconciled to Ottoline's choice, and a little family dinner-party has been arranged to celebrate the formal recognition of the engagement. But Ottoline's brother, an unbearable young cub, thinks that there is something queer about the success of the book, and has set a private detective to inquire into it. That worthy reports that 25,000 copies have indeed been printed, but that almost all of them are reposing in the cellars of a bogus exportation-agent somewhere in the City. The inference which young Filson suggests to the assembled family is that Mackworth has entered into a plot with his publisher to create a fictitious success, the expense of which he will easily be able to meet as soon as he is in possession of Ottoline's money. This intelligence is a thunderbolt to Mackworth, hurling him from the seventh heaven of success into the limbo of discreditable failure. But who has made him the victim of such a cruel—and costly—trick? The answer is close at hand—it is Ottoline! She confesses; and Mackworth, under the blow of the disappointment, treats her with a frigidity more cutting than any reproach. A night brings him to his senses and he implores her pardon; but at the same time he speaks of burning the book he has begun, and giving up his art. She tells him that she has recognized in herself an incurably vulgar and pushing strain, which would always be offending him, and furthermore—what is perhaps more serious—that he evidently cares more for his art than for her love. So she resolutely tears herself away from him, and leaves him to go on with his new book in solitude.

Though I am sure nothing was further from Sir Arthur Pinero's mind than any thought of Ibsen, he has here repeated the end of "A Doll's House." The resemblance is unmistakable, and shows how small is the world of dramatic *motifs.* A woman, out of pure love for a man, has committed a thoughtless and foolish act which, when discovered, threatens to involve him in disgrace. In the first moment of consternation he gives no thought to her motive, but, absorbed in his own disaster, treats her with selfish cruelty. The crisis reveals to her both her own character and his, and she sees that all must be over between them. The two situations are identical in essence; and Pinero's, though for different reasons, is as disputable as Ibsen's. It will be admitted, I think, that Nora's reasons for leaving Helmer would be entirely adequate were it not for the children; the question is whether the existence of the children does not create a bond between them which she could not and would not break. Between Ottoline and Mackworth there is, of course, no such bond; there is not even the tie of marriage; but, on the other hand, Pinero

has not made the disparity of character nearly so plain as Ibsen has. Though there is a something about Ottoline throughout—a tinge of affectation, manifesting itself partly in a constant use of French phrases—which puts us on our guard as to her character, we feel that in the end she does herself injustice, and that any reasonable man would find no difficulty in forgiving her foibles for the sake of the deep and really beautiful sincerity of her love. But, then, it may be said, Mackworth is not a reasonable man—he is a fanatic and a prig—so that Ottoline's action is, after all, justified. That is true; but Sir Arthur has not given us the clue to Mackworth's character quite early enough. The fact that the author so obviously shares his hero's rage against social push and self-advertisement inclines us to regard Mackworth altogether sympathetically. We are consequently taken aback when, in the poignant situation of the third act, he behaves with such stupid egoism; and even up to the end we have not yet quite reconciled ourselves to the idea that this is an essential and determining trait in his character. "If either of them had the slightest sense of humor," a critic has said, "there is no reason why they should not marry and live happily forever after." The author may justly reply that he deliberately deprived his hero of humor, which is perhaps, by the way, the secret of his failure as a novelist. That is a good plea; but the deficiency is not made quite clear enough. With all deductions, however, "The Big Drum" remains a most interesting and delightful comedy.

THE RETURN OF "GRUMPY."

The reappearance in New York, at the Empire Theatre, of that finished actor, Mr. Cyril Maude, is not only a source of satisfaction, but an excuse for certain dramatic speculations. "Grumpy," though provided with an interesting plot, owes its success to a leading character who exhibits little novelty. Like his name, he is as old as time. But he is, above all, human. And, though the play would in all probability not have flourished without an actor abundantly suited to the part, it is to be remembered that any number of modern instances could be cited in which very competent acting has not sufficed to save a seemingly promising play from failure.

The truth is, the endeavor to give fresh ideas to the stage has largely resulted in a shameful neglect of human nature. With the purpose of keeping pace with modern problems, playwrights have attempted to answer the large questions of the day with all the finality of the muckraker, and in so doing have forgotten that the truthful representation of character is the main requisite of a theatrical performance. If your characters are puppets, no amount of powerful arguments put into their mouths will suffice to make them real or your play convincing. It is only closet drama—which is not designed primarily for acting—that can afford to rely on ideas at the expense of character. By some futile twist of reasoning, American playwrights in recent years have fancied that, let us say, a political boss requires verisimilitude merely in the matter of outward appearance. His office force must be caught to the life, his especial brand of cigars indicated, as also a suggestion of the mechanical devices by which he perpetrates his villany. These he undoubtedly has in actual life, but our writers forget such important human considerations as the fact that a successful politician is invariably devoted to children and dogs, to mention only one or two possibilities.

The authors of "Grumpy" have not made this mistake. Here is a character straight from Dickens or Thackeray—a man as pestiferous as you please on the surface, but with a heart warm and true. We commend to ambitious young playwrights the study of American types—for not all, by any means, have been exhausted by their predecessors. When they have discovered one to their liking, they will most probably discover, too, that the relations of this character are ample to embrace an interesting modern problem. F.

The representation of "A Pair of Silk Stockings," which Mr. Winthrop Ames has scheduled for a run of three weeks at the Booth Theatre, is notable only for the addition of two performers to the cast of last year. Mr. Sam Sothern, who was a member of the original cast in England, is seen to advantage as the husband of the naughty Molly Thornhill, which latter part is taken this year by Miss Eva Leonard Boyne. His work is quiet, as the comedy of the drawing-room should be quiet, and yet he indicates without difficulty the contrasts of his rôle. As Lady Gower, Miss Alison Skipworth is well-nigh perfect; she has, above all, charm, the ample charm of *embonpoint* and the spiritual charm of agreeable manners and speech; and even in her little dogmatisms and bigotry she never becomes unattractive.

Music

Thomas Beecham, the London orchestral leader, seems to have an even more remarkable memory than Toscanini. According to Robin H. Legge, he conducted from memory at twenty-four hours' notice Strauss's "Rosenkavalier." Mr. Legge also recalls the fact that Hans von Bülow learned the score of a Stanford symphony on the train between Hamburg and Berlin, and conducted it from memory in the latter city.

October 25 is the date chosen for the opening of the two weeks' performances of the Boston Opera Company in New York in conjunction with the Pavlowa Russian Ballet. The Lexington Avenue Opera House, built by Oscar Hammerstein two years ago when he intended to give opera in English, has been chosen for these representations.

An exclusively Russian programme has been arranged by Clara Gabrilowitsch for her first Aeolian Hall recital next month. It will include songs by Glinka, Rubinstein, Tchaikovsky, Rimsky-Korsakoff, Glazounoff, Arensky, and Rachmaninoff.

"The Musical Blue Book of America" is a useful volume of 429 pages compiled by Emma L. Trapper. It contains information concerning the doings and whereabouts of more than four thousand persons more or less prominent in the musical world.

Only thirty-eight works were sung last season by the Royal Opera Company in Berlin, as compared with forty-six the preceding year. Some of the most important works in the repertory, notably Wagner's "Parsifal," "Rheingold," and "Götterdämmerung," had to be excluded, not so much because of a shortage of singers as because so many of the stage hands employed in the scenic department had gone to the front. Nevertheless, Wagner kept the lead, with sixty-seven performances. Verdi came next, with thirty-eight; Strauss followed, with twenty-three; Mozart (whose "Magic Flute" also had to be abandoned because of the shortage of stage hands) had sixteen. Beethoven's "Fidelio," which had been sung only three times the preceding year, was demanded thirteen times, and Bizet's "Carmen" received the same number of hearings. Weber had twelve performances; Donizetti, eleven; Rossini, Blech, Thomas, and Puccini, ten each; Mascagni, nine, etc. Of the twenty-three composers represented, fourteen were Germans, six Italians, and three Frenchmen, no other nations being represented. There were 174 performances of twenty-five German operas, seventy-nine of ten Italian, and twenty-six of three French operas. Wilhelm Altmann calls attention in the *Allgemeine Musik-Zeitung* to the fact that of Richard Strauss's operas the only one which attracted the public was the "Rosenkavalier." The six operas most often sung were "Lohengrin," "Figaro," "Traviata," "Carmen," "Fidelio," "Tannhäuser," in the order given.

It is to be hoped that Weingartner's attempt to bring back to the stage Weber's charming opera, "Oberon," will succeed elsewhere as it has succeeded in Hamburg, where his version of that fairy tale in music was recently staged. It is much to be regretted that, when Gustav Mahler was one of the conductors at the Metropolitan, he was not permitted to produce his own version of Weber's last opera. Now that Weber's "Euryanthe" has won so much favor in our opera house, the matter will perhaps be taken into consideration. Why not produce "Oberon" as Weber left it? Because he left it in a condition with which he himself was far from satisfied. He was far gone with tubercular trouble when he received a hurry order from London for a new opera. His physician forbade his accepting it, but he needed the money and began to compose the music of parts of the opera before he had seen the whole of the libretto, which was not yet finished. When at last he did see it, he realized too late its inadequacy. He made up his mind to have it remodelled and to revise the music on his return to Germany, but death from exhaustion frustrated this plan. His pupil, Benedict, was the first who tried to carry out his intentions. Several others followed his example, without much success. Dr. Leopold Schmidt expresses the opinion, in the Berlin *Tageblatt*, that, of all the attempts to come to the rescue of "Oberon," Weingartner's is the most acceptable. He has reduced the spoken dialogue to a minimum and added some musical numbers which are surprisingly Weberish. Let us have "Oberon," by all means. There are no new operas half as inspired.

The London musical season which ended a few weeks ago was pronounced by one of the critics "very unusually slack"; yet from the last week in April to the end of July over 300 musical entertainments of various kinds were noticed in the columns of the *Daily Telegraph*.

D'Albert's "Tiefland," which is also known to New Yorkers, has for years been one

of the most popular of operas in Berlin, but it is only this season that it will have the honor of being sung at the Royal Opera. Heretofore it has been given at the Komische Oper and in the suburban Charlottenburg.

One seldom hears viola players as soloists, largely because so little has been written for them. Lionel Tertis is trying to remedy this. He is leader of the violas of Queen's Hall, and he has informed a correspondent of *Musical America*, Wallace L. Crowdy, that Ravel, Ysaye, and Delius are writing works for him, and that he hopes to persuade other composers to turn their attention to the great beauties of his chosen instrument.

A revised edition of "Elements and Notation of Music," by James M. McLaughlin, Director of Music in the Boston public schools, has been issued by Ginn (50 cents). It differs from the earlier editions in including definitions and terms in general use in the teaching of music in the schools of this country.

Finance

THE "ANGLO-FRENCH LOAN."

Out of a good deal of confusion regarding the negotiations between the Anglo-French commissions and the American bankers, over the proposed large loan to Europe, several essential facts have at length emerged. One is, that the loan's success, in some form, is virtually insured. It will presumably be for $500,000,000 or more; will run for probably five years; will bear interest at 5 per cent., and will be payable, interest and principal, in American currency. In minor particulars, these general presumptions may be modified. There has been discussion, for instance, as to whether the use of the proceeds of such a loan for purchase of war material might be modified—not because loans for that purpose are improper, or because the munitions exports are themselves "unneutral," but in order to overcome the objection of pro-German interests identified with the lending institutions.

But the central consideration of all, which the public at large was somewhat slow to comprehend, is the unquestioned purpose of the borrowing Governments to draw on the proceeds of the loan only in paying for purchases of merchandise in the United States, and to leave those proceeds on deposit with the American banks until such bills shall fall due. It is only lately, also, that even the banking and mercantile community, West as well as East, has grasped the principle that this is not a war loan, such as the American subscriptions to the Boer War issues of 1900, or the spasmodic American purchases of the Imperial German war loan last spring. In its nature, the pending Anglo-French operation is purely a matter of granting long credits on purchases of merchandise for foreign account in the American market. The banks are virtually discounting bills arising from such transactions. It is a highly important step in the performance of the new functions of this country as the central money market of the world.

It is more than this. Granting of credits or purchase of securities, for the purpose of equalizing a disturbed balance of international exchange—whose effect had proved to be damaging to all markets concerned—is a perfectly normal and usual economic recourse. But for the fact that the Governments to which the borrowing markets belong are now in a state of war, no competent financier would think of objecting to the operation.

A further consideration, which the financial community has only begun to realize, is the effect which such an operation will be bound to have on this country's power and prestige, when the war is over. One theory, as to what will happen then, has been that London would instantly dislodge New York from its new position as a money centre; another has been, that the European holdings of American securities would then pour out in prodigious quantity on our markets, compelling large outflow of gold from the United States. But the obvious result of our markets' holding French and English obligations in such quantity would be, first, that London could not regain her old-time prestige until her indebtedness to America had been paid off, and, next, that even if we were compelled to redeem our own foreign-held securities in full, we should simply pay for them with the bonds of England and France, of which the proceeds had already been expended in the American industrial markets.

In the popular mind, some perplexing questions still remain. Can the people of the United States afford to lend $500,000,000 to $1,000,000,000 to Europe, even if the credit of the borrowers be indisputable? How would the loan affect our money and investment markets? Would institutions hold the bonds, or private individuals? What sort of trading should we have in them? Would they be "listed," for example, on the Stock Exchange? These questions have been asked by many people during the past two weeks.

The loan could easily be placed. Money is abnormally easy. The banks of New York alone hold a surplus reserve of $100,000,000 more than on January 1, and it was very large, even then. New bonds listed on the Stock Exchange in the first half of 1915 were $330,000,000 less than in 1905, and new stocks listed were $359,000,000 less than in 1901, and the country's available capital is far greater now than in either year. In eight months of 1900 and 1901, we took $330,000,000 bonds from the British Exchequer; even in 1898, when our own Government offered a popular loan of $200,000,000, subscription offers aggregated $1,500,000,000.

On neither occasion were the money or investment markets seriously disturbed, and the resources of those markets are vastly greater now. It is doubtful, therefore, if even a loan for more than $500,000,000, with the proceeds left in American banks until drawn upon for expenditure, and with the expenditure itself made in the American markets, would affect the money rate or the price of existing securities, even temporarily. Indeed, it is probable that the success of the loan would check the European liquidation of our own securities, which has weighed on the investment market. At any rate, the British Government's pressure on English holders to sell would certainly be relaxed.

Banking institutions would certainly be the original buyers; they might be the permanent holders. They were so in the case of our purchases of England's "Boer War loans," though not in the Japanese loans of 1904 and 1905. If our people showed a disposition to deal in the Anglo-French securities, the bonds would undoubtedly be distributed, for large private capitalists would be extensive buyers at the start. A public offering might be necessary, as a preliminary to listing on the Stock Exchange. But the "curb market," which even to-day buys and sells the German and French one-year 5 per cent. notes of last spring, would surely trade in them.

If they were listed, and then dealt in freely by the investing and speculative public, the day-to-day prices of the five-year loan would possibly vary according to two influences—the home financial developments in France and England, and the war news. We may yet see a "bear raid" on Anglo-French 5s, on news of the fall of Petrograd, or a "bull movement" on the capture of Constantinople.

Mechanism of Mendelian Heredity

By T. H. MORGAN, Professor of Experimental Zoölogy in Columbia University, A. H. STURTEVANT, H. J. MULLER, and C. B. BRIDGES, also of Columbia. xiii + 262 pages. 8vo. $3.00.

This discussion of the most recent developments in the field of Mendelian Heredity is intended for work with advanced students who have gone beyond the textbook stage. Its plan differs from all others in that it gives an account of the mechanism of Heredity that is based on the very extensive modern work on the Cell. The book also attempts to bring before the reader the general philosophical argument on which the modern factorial conception of Heredity rests.

The Everyday Life of Abraham Lincoln

By Francis F. Browne
Late editor of *The Dial*
Compiler of "Bugle Echoes," "Golden Poems," etc.

12°. *With Portraits.* $1.75.

The original edition of this book was published about twenty years after Lincoln's death, and has continued to attract attention among the growing circle of Lincoln's admirers.

This book brings Lincoln the man, not Lincoln the tradition, very near to us. It embodies the reminiscences of over five hundred contemporaries and friends of Lincoln—reminiscences which were gathered largely at first hand.

New York G. P. Putnam's Sons London

THE CENTURY
for October

Meddling with Our Neighbors
Have we Belgianized Nicaragua? The Stars and Stripes were floating over the White House in the Capital of Nicaragua when Lincoln G. Valentine wrote this astounding article. For five years Nicaragua has been virtually in charge of American marines. The five Central American Republics, formerly a single union, are clamoring for reunion and armed resistance to the "Eagle of the North."

Old Masters of Photography
Alvin Langdon Coburn, himself a master of the art of which he writes, tells about four great pioneers in the field of photography.

The Average Voter
Is the average voter a failure? Is there an average voter? Walter Weyl, in this searching article, takes stock of America's voting quality.

My Debut in Paris
Francis Grierson, the strange musical genius who was raised in America and then amazed Europe with a new kind of music, tells of his introduction to the brilliant Parisian society of the end of the Second Empire.

Female Delicacy in the Sixties
What is so rare as a swooning lady now? But they weren't rare sixty years ago. They were the ideals then. Amy Louise Reed discusses the almost incredible foolishnesses of and about women, especially young women, before the Civil War.

"Here Comes Grover"
The Fat Boy is peculiar to himself, typically unique. His heart and mind know different reactions from those of an ordinary mortal. His bashfulness betrays strange complexes. Grover, in Frank Leon Smith's story, lives, breathes—and pants.

Rome Rampant
Did Italy go to war to avoid revolution at home? T. Lothrop Stoddard analyzes the Italian situation in his usual clear, vigorous, entertaining way.

The Friends
One of the best short stories of the year, a thing of almost uncanny fascination. It is made of men and things as commonplace as cabbages; yet through some legerdemain in the telling it achieves a continuously cumulative interest that is fairly astounding.

"Pleasures and Palaces"
The third instalment of Princess Lazarovich's sprightly reminiscences of social and artistic life in Europe; and the third instalment of "Dear Enemy," Jean Webster's very charming serial; the fourth instalment of "We Discover New England," in which Louise Closser Hale and Walter Hale visit the North Shore; two humorous short stories; "The Long Way," a piece of vigor and splendor in verse by Badger Clark; verse of distinction by Louis Untermeyer and others; and *The Century's* customary rich offering of inset pictures.

NEW YORK, THURSDAY, SEPTEMBER 30, 1915.

Summary of the News

The week has been a comparatively uneventful one in diplomacy. A further German note in reply to the American communication of August 10 regarding the case of the sailing ship William P. Frye was received at the State Department on September 22 and its contents made public in the morning papers of September 24. The latest communication of the German Foreign Office, which is dated September 19, on this long-standing question is, as we note elsewhere, conciliatory in tone and assents to most of the suggestions made by Secretary Lansing in his note of August 10. American ships carrying conditional contraband, we are assured, will not under any circumstances be destroyed, but the right is reserved to destroy merchantmen if their cargoes are absolute contraband when such ships cannot conveniently be taken into port. Germany also accepts the proposal of the United States that the indemnity to be paid for the loss of the Frye shall be determined by a commission of two experts, chosen, respectively, by Germany and the United States, and the further American suggestion that the question of legal justification for the destruction of the Frye, in so far as it involves the interpretation of existing treaties, shall be submitted to arbitration at The Hague.

No further progress is to be recorded in the negotiations between Count Bernstorff and the State Department in regard to the general issue of the submarine warfare. Count Bernstorff is understood to have taken the position that a serious difficulty is presented by the orders of the British Admiralty to merchantmen to endeavor to ram submarines on sight and the offer of substantial rewards for so doing. The German Government last week took occasion to reaffirm its denial that the Hesperian could have been sunk by a German torpedo. On the other hand, from British sources it is reasserted that a torpedo and not a mine caused the destruction of the vessel. In this connection we note as a matter of record the story, which appeared in the New York *Times* of September 24, of the master of the British steamship Crossby, who declared that he witnessed the torpedoing of the Hesperian, and that the same submarine afterwards chased the Crossby for several hours. Fragments of metal found on the deck of the Hesperian, which, it is alleged, could only have come from a torpedo, have been sent as evidence to the United States.

The departure of Dr. Dumba, the Austro-Hungarian Ambassador, has been delayed on account of the failure of his Government to issue definite orders for his recall and the insistence of the State Department that only the recall of the Ambassador, and not "leave of absence," would satisfy the demands of the United States. Dispatches from Washington of Monday's date, however, stated that informal information had been received from Ambassador Penfield, in Vienna, that the Austro-Hungarian Government would recall Dr. Dumba.

A further note, it was announced on Monday, has been addressed to the State Department by the Austro-Hungarian Government relative to the export of munitions from this country. The note, according to the cabled summaries, disclaims any expectation on the part of Vienna that the United States Government should forbid a "normal" traffic in munitions, but asserts that the protest was made against the economic life of the United States being made subservient to the production of war material on the greatest possible scale.

Dispatches from Washington of September 24 indicated that arrangements had been made for the release of American-owned goods of German and Austrian origin at present detained in neutral ports of Europe by the British Order in Council. The British Embassy has notified the State Department that it is prepared to receive applications for permits to export such goods in cases where American importers had either paid for them or had rendered themselves liable for the purchase price before March 1, 1915.

The Anglo-French Commission, which has been negotiating the terms of the credit to the Allies, left New York for Chicago on Monday. No official announcement of the terms so far agreed to has been made, but it appears to be definitely established that the amount of the loan shall be $500,000,000. Information in Tuesday's papers was to the effect that the five-year notes convertible into fifteen-year 4½ per cent. bonds would be offered to investors at something less than 98½.

The activity of German submarines has been somewhat revived during the past week, but the quota of their victims still falls considerably short of what we have been taught to regard as the normal. Seven British ships have been sunk by submarines in the North Sea and one in the Mediterranean since we wrote last week. A British, a Dutch, and a Danish vessel have also been reported sunk, but the dispatches leave it in doubt whether the destruction was caused by mines or submarines. Elsewhere we note our satisfaction at the circumstances of the sinking of the Anglo-Colombian, reported in Saturday's papers.

The tenseness in the situation caused by Bulgaria's order of mobilization, which we recorded last week, has been sensibly relaxed. The order was hailed with unrestrained joy in Berlin as presaging the entry of Bulgaria into the war on the side of the central empires, and by the French and British press was generally regarded as representing a defeat for Allied diplomacy. What have been the actual intentions of King Ferdinand and his Premier, M. Radoslavoff, it is still impossible to say, but, in view of the developments of the past few days, the theory that Bulgarian mobilization represented a "bluff" is at least as tenable as any other. Greece replied to the threat on Friday of last week by ordering the mobilization of her naval and military forces, and has made it evident that she is prepared to stand by both the letter and the spirit of her treaty with Servia. It was also announced that Greece, in the event of war, would receive the support of an expeditionary force of the Allies operating from Salonica. That the Bulgarian coasts would be exposed to attack by the Allied fleets may have been a further consideration that hastened Bulgaria's official reaffirmation that her mobilization had been ordered solely for the purpose of "armed neutrality." Little of a definite character has been heard during the crisis of the possible attitude of Rumania. It is known that Germany has exerted all possible pressure to induce the Rumanian Government to permit the passage of munitions through the country, but this pressure has so far been resisted, and dispatches from Bucharest of Monday's date stated that at a meeting of the Cabinet it had been decided not to modify in any way the present line of conduct.

Dispatches from Berlin at the end of last week announced that the total of subscriptions to the third German war loan was in the neighborhood of $3,000,000,000.

Reports from various sources during the past week leave, unhappily, but small room for doubt concerning recent atrocities, amounting to a policy of annihilation, committed by order of the Turkish Government on the Armenians. According to a statement by Prof. Samuel T. Dutton, secretary of the Committee on Armenian Atrocities, made public on Sunday, not less than half a million Armenians have already been murdered or forced into the deserts of northern Arabia. The German Ambassador, Count Bernstorff, in a letter made public on Monday, characterized all reports of Armenian atrocities as "pure inventions."

On both fronts during the past week the position of the Allies has been materially improved. In the east the Russians appear to be holding fast on their right, resisting von Hindenburg's efforts to take Dvinsk, while at the southern end of the line they have made substantial progress. Lutsk has been retaken, and on Tuesday Kovel also was unofficially reported to have been captured from the Austrians. In France and Flanders the long-awaited Allied offensive, after a long period of preliminary bombardment, was commenced on Saturday of last week, and continues as we write. Notable successes were achieved by the British north of Arras, Loos, twelve miles from Lille, being captured, and by the French at Souchez, which was taken, and in the Champagne, where fifteen miles of trenches were captured. Unwounded German prisoners to the number of 23,000 were taken, besides seventy or more cannon and a large number of machine-guns.

A further raid of Mexicans into Texas occurred on September 24. In the skirmish that ensued an American private was killed and an officer wounded. No material change has occurred in the general situation. In Hayti, also, clashes occurred on Sunday and Monday between American marines and Haytian rebels in which an American sergeant was killed and ten marines wounded.

The Week

The full significance of the notable Allied successes on the western front is to be determined by the tremendous fighting still under way. The new battles of Champagne and Artois are under way as we write. To be sure, even if the Allies are checked on their present line they will still have scored their most notable success since the battle of the Marne, and made the greatest advance won by either side in the west since last September. Compared with the British advance of half a mile on a front of four miles at Neuve Chapelle, the French gains of last winter in Champagne, the German "gas" victory of four miles by two east of Ypres, and the Crown Prince's advance of three weeks ago on a front of one mile by one-third of a mile, the French drive of Saturday and Sunday, two miles deep over a front of fifteen miles, stands out as a major operation. The number of German prisoners—more than 20,000—emphasizes the magnitude of the victory. For an adequate comparison with the operations in Champagne we must go to the east and the great Teuton thrust against the Russians in Galicia of last spring which marked the beginning of the end of the Russian offensive. From Tarnow to Gorlice, the line along which the Mackensen "phalanx" was hurled against the Russian front with shattering effect, is twenty-five miles. In the Champagne the front must have approached nearly that length, of which fifteen miles measures the width of Gen. Joffre's victorious phalanx.

Viewed in detail, the gains made by both the French and the English have value as a threat against the German line of communications, between the Argonne and the vicinity of Rheims, and between La Bassée and Arras. Rheims is the apex of a triangle of which the Argonne is the base and the two lines of railway from the north and the south end of the Argonne to Rheims are the sides. The northern railway lies behind the German lines. The southern railway lies behind the French lines. The control of the respective railways was the natural object of campaign on either side. The Crown Prince's efforts to the west of the Argonne have had this objective. On September 8 the Germans got a third of a mile nearer the railway along a front of one mile. Only the other day the German heavy guns were firing into St. Menehould, which is the centre of the French position in the Argonne. The latest French victories are the reply to this threat. At Tahure and to the south of Somme-py the French are now less than three miles from the German railway line. The control of this line would naturally disorganize the entire German position from Verdun to Rheims and beyond. The British and French effort north of Arras was directed against the highway from La Bassée through Lens to Arras and the railway a mile or two behind the high-road. By seizing the village of Hulluch the British have got astride of the La Bassée-Lens road. Around Thelus the French have got astride the same road half-way between Lens and Arras. To the extent that the enemy employs motor communication along this road, his lines have therefore been cut. It would require another short thrust to cut the railway which runs in a curve from La Bassée through Lens to Arras, and so further endanger the German position.

Both the spirit and the substance of the latest German note on the case of the William P. Frye are highly satisfactory. Most of the claim which we asserted has been conceded, and what remains is discussed not only in the accents of friendliness and respect, but—what in the case of German communications concerning questions of war ethics is at least equally important—in the language of reasonable argumentation. As an indication of the final outcome of our controversy with the German Government, the note is distinctly of good augury. It must be remembered, however, that the questions at issue in connection with the Frye have never been of such character as to threaten serious consequences, and have little or no connection with those arising out of the destruction of the Lusitania and the Arabic. The Frye question, provided only that good will in relation to its treatment was manifested, has been one that might drag indefinitely without danger. The issue that has been critical is that of the safety from German attack of American lives on merchant ships of enemy nationality. Our position on this question was that of the maintenance of a fundamental right, the character of which is absolutely unmistakable; while, on the other hand, Germany's indisposition to acknowledge the right was due to the feeling—whether well-founded or not—that she had at stake in this matter an interest of enormous importance to her in this war. Nevertheless, the tone of the Frye note can scarcely fail greatly to strengthen the confidence of those who believe that the whole difficulty will soon be satisfactorily settled.

Coming on top of the satisfactory note from the German Government on the Frye case, and of various unofficial reports concerning the submarine policy now ruling at Berlin, the story of the treatment of the British steamer Anglo-Colombian, as cabled by Wesley Frost, our Consul at Queenstown, was naturally welcomed as highly encouraging. If the question still drags, if our State Department shows itself wary about accepting pleasing demonstrations at their face value, this is but the counterpart of its wariness about plunging into irremediable conflict when confronted with doings of the opposite character. If we could be patient when the actions of the German Government were such as to make patience almost impossible, we can certainly afford to be patient when there is a substantial prospect of thoroughgoing settlement. The Administration set out to attain a result of that character, and it cannot be satisfied with less.

Just what Capt. von Papen meant when he wrote to his wife that he always tells "these idiotic Yankees" to hold their tongue, is perhaps the least important question that has yet arisen in connection with the great war. Nevertheless, it *has* arisen, and has given rise to all sorts of comment, including a certain amount of candid acceptance of the designation on the part of those who regard this or that characteristic of American politics, society, journalism, or what not, as deserving of the label used by the German military attaché. This being so, it is perhaps worth while to point out that the context shows the Captain's mind to have been not on any of these large aspects of "Yankee" civilization, but on something relating specifically to his own profession. The passage, as printed in the New York *Times*, was as follows:

> . . . The sinking of the Adriatic may well be the last straw. I hope in our interests the danger will blow over. How splendid on the eastern front.
>
> I always say to these idiotic Yankees that they had better hold their tongues. It is better to look at all this heroism with full admiration. My friends in the army are quite different in this way.

But evidently the paragraphing is wrong. "How splendid on the eastern front" belongs with the following paragraph, the whole of which then relates to the achievements of the German army. It may be that the Captain regards us poor "Yankees" as *blödsinnig* in every respect, but apparently he wishes to pass that judgment on us only as regards ability to estimate military prowess; and

he exempts from the judgment those "Yankees" who have been so fortunate as to be saved from all idiocy by a West Point education.

A collation of various reports of the *Vorwärts* article on European food prices shows the boldness of its character. It is a flat contradiction of statements circulated in Germany that food prices in England are as high as in that country, and is reinforced by a tale of rates per pound reduced to pfennigs. It points out that before the war English workingmen were known to live cheaper than German, and that the relative increase in Great Britain has not altered the price-level in Germany's favor. English beef is 90 pfennigs, against 141 in Germany; veal is 94, against 144; mutton 89, against 147; and pork 84, against 188. As the German laboring class consumes far more pork than other meat, it has to pay double the British price for its staple meat dish. As for Austria-Hungary, "the prices there are even much higher than in Germany. The populace was obliged to content itself for months with a strong admixture of maize or barley in bread, greatly deteriorated in taste and digestiveness. There is a scarcity of meat, and . . . on two days of the week no meat may be sold." There are difficulties in comparing the prices of foodstuffs of different lands, arising from differences in statistical methods, and *Vorwärts* presents its figures with reservations. But its article warns Germany not to take undue comfort from one expert's estimate that English food prices have advanced 49.5, and another's that they have advanced 45.3 per cent.

The statement on the Turkish massacres sent out from Paris by representatives of the Armenian Church adds another document to evidence that is fast becoming impressive. Again it is asserted that the number of deaths approaches half a million; again it is declared that "Christian martyrdom has at no time assumed such colossal proportions." The Church representatives refer to direct reports in their possession as the basis of these assertions. It is simultaneously telegraphed from Washington that the records of the State Department are replete with detailed letters from American consular officers in Asia Minor, giving harrowing tales of the treatment of Armenians by the Turks and Kurds, and confirming allegations that a war of extermination has been undertaken. One step to be taken is the alleviation of suffering in Armenia through a relief fund. If the outrages have anything like the magnitude reported, the American Government ought to register a formal and emphatic protest without loss of time. As Lord Bryce has said, our official voice is the only one that has any power. Ambassador Morgenthau is said already to have made general representations: backed by a full and official statement of the indignation with which the American people regard the Turkish crimes, he might be able to put a period to them.

Villa's troops have abandoned Chihuahua without a struggle and are now reported to be passing through Juarez headed due west for the Sonora hills. When the military history of 1915 comes to be written it will not, after all, be a record of trench-digging and deadlock. The Teutonic campaign against Russia will be proof that battles in the grand manner are not a thing of the past, and possibly the military historian will not disdain to cast a glance at Mexico. Within its own limits, Obregon's sweep against Villa may compare with the sweep of Hindenburg and Mackensen against the Russians. Only a few days before the Austro-Germans crashed through the Russian line in Galicia, the forces of Carranza under Obregon defeated Villa's army at Celaya, to the north of Mexico City. In the five months that have elapsed Obregon has thus driven Villa's forces clear to the American border over a distance of 900 miles, or more than three times the distance covered by the victorious Austro-Germans in the same time. And Obregon's record has been very much like the Teutonic record in its steady tale of miles covered and cities taken—Aguascalientes, San Luis Potosi, Durango, Saltillo, Torreón, Chihuahua, and, as seems likely any day now, Juarez. The only difference—apart from the obviously enormous difference in the scale of the fighting—between the advance of the Mexican victors and those in Europe is that the Teutonic progress seems to be slackening, whereas Obregon's advance has steadily gained momentum.

With the retirement of Villa's forces into Sonora the end of organized resistance to Carranza becomes plainly a fact. It has been virtually a fact for some time, inasmuch as the retreat of Villa's forces for some time has been a flight rather than a retreat, cities like Torreón and Chihuahua being abandoned without resistance. From Juarez a spur of the National Railways runs west to Casas Grandes on the Chihuahua side of the Sonora border. There the high Sierra begins. Where there are railways, Villa is at a disadvantage, since it enables his pursuers to bring their superior forces into action. It is in the wild country to the west of Casas Grandes that Villa must count upon making some kind of a stand, his activities being without doubt confined to a guerrilla warfare sufficient to disprove any claim Carranza might make to the exercise of complete control. But Villa himself, if he is to draw any assistance from across the border or from outside Mexico, must move westward till he strikes the railway running north from the port of Guaymas to Nogales on the Arizona line. The campaign of Carranza will, therefore, in all probability take on the form of a double advance, one from the east across country, while the main advance will come from the south by the railways that run into Guaymas and so north.

The modification of the treaty with Hayti by the transfer to the Bank of Hayti of powers which it was at first proposed to give to an American financial adviser is an inexpensive and tactful concession to the self-respect of the republic. It was in this attempt to set up a financial representative of our Government who would have more power than the Haytian President himself that the original draft went so far beyond the Anglo-Dominican and other conventions. The Haytians had protested against such an officer, and also against the American Receiver-General, who is to be placed in charge of the custom houses. Both, they thought, would clash with native dignitaries, and breed increasing ill-feeling. The treaty which President Dartiguenave has now signed very properly leaves the customs in our hands; the corresponding representative in Santo Domingo has never experienced any difficulty, and his administration has been to the benefit of all concerned. If there is any one who thinks that the Receiver-General and the American Minister will not be able to put a sufficient curb on wrong-headed tendencies in Hayti, he need only read the last report from Receiver-General Baxter in Santo Domingo, with its account of the execution of President Wilson's plans in political as well as fiscal affairs. The addition of an autocratic "financial adviser" would have constituted a needless offence to the islanders' sense of independence.

Secretary Daniels's letter to his new Naval Advisory Board requesting suggestions for a

new experimental and research laboratory at Washington doubtless prefaces an appeal to Congress for the authorization of better facilities along these lines. The weight of the names of the advisers will help carry the appeal, as in the future it may be of service in obtaining governmental support for other projects relating to the development of scientific methods. But such a step emphasizes the fact that it is the Navy Department and its own employees which will assume the burden of the hard inventive thinking and the hard routine work involved in formulating new naval departures. Part of the public which has been reading of the Secretary's success in obtaining the services of an authority on astronomy and mathematical physics, another on sound and its measurement, another on smokeless powder, another on the turbine and electrical naval propulsion, another on coaling apparatus, and another on ship-stability, may have the impression that this group is to become the brains of the Navy Department. In asking for improved laboratory facilities, Secretary Daniels emphasizes the fact that the talent the navy has always possessed must continue to be its mainstay—and he says a just word in praise of that talent. The three chiefs of the bureaus of Steam Engineering, Ordnance, and Construction, with their subordinates, have long been doing a surprising work in supplying ideas and developing them, and this under difficult surroundings. Mr. Edison and his twenty-three helpers may prove of great value, but the essential activity must be that of the Department's permanent staff.

Those who have hearkened to the noisy cry from one or two sources that the Constitution proposed for New York State is a reactionary instrument, which will chain the State to a government by political machines, grasping interests, and narrow bureaucrats, must be astonished at the way in which exponents of progressivism are coming out for it. One of the most notable of the radical-minded and forward-looking school of sociologists and political thinkers, Prof. Samuel McCune Lindsay, reviews it in the *Survey* with the warmest praise. He examines it not only as a specialist in social legislation and administration, but as one who has made a comprehensive study of the organization of government. It will receive the approval of all advanced voters, he concludes. "Not a single distinctly backward step is taken in any change proposed in the new Constitution, and while in many particulars the Convention has not gone as far as desired by those who want the Constitution of the Empire State brought fully abreast of the progress made in government in other States and in foreign countries, it is in every particular an improvement on the existing outworn Constitution, and a very considerable move in the direction of progress and adjustment to the new demands of existing conditions." Professor Lindsay's view is not unexpected; he watched the work of the Convention with approval. But those who read his reasons for his stand can hardly believe that the bosses have neatly hoodwinked him.

There is one feature of the Philadelphia primaries that is not encouraging for the reformers; that is the nomination by the Democrats of a separate candidate for Mayor. Director Porter, who ran on the Republican and the Washington party tickets, ran also on the Democratic ticket. No one supposed that he would come anywhere near to winning the Republican nomination, but there was no reason why the handful of Democrats in Philadelphia should put up a candidate of their own. But while about 3,000 of them voted for Porter, twice as many voted for their own candidate. There may be a few Democrats in that city who desire a separate municipal ticket as a matter of party pride, but everybody knows that the real reason behind the separate ticket is the desire of the Democratic machine to keep things together for trading purposes with the Republican organization. The Democratic *Record* remarks that there is yet time for union of all anti-machine forces, and that it does not care under what party label the fight is waged; but it is also frank to say that no effective opposition can be made with divided ranks. Porter polled rather more votes on last Saturday than Blankenburg polled in the primaries four years ago. It is the plain duty of decent Philadelphians to turn this fact to advantage, by providing for the concentration of these votes against the return of the gang.

The equal suffrage invasion of Canada has at last achieved a definite result in the announcement of Premier Sefton, of Alberta, that a governmental measure will be brought into the forthcoming Provincial Legislature "placing men and women on a basis of absolute equality so far as provincial matters are concerned." The majority of the Liberals is such that the Premier's declaration is a virtual guarantee of the ballot to over 100,000 women. While he speaks only of provincial equality, their admission will be to Dominion suffrage also, for by an act passed at Ottawa in 1897 the Dominion electoral qualifications are made those of the various provinces. The Toronto *Globe* is of the opinion that "other provinces will no doubt fall rapidly into line, and in a few years, perhaps a few months, people will be wondering why the reform hung fire so long."

Keir Hardie and John Burns won their first seats in the House of Commons together in 1892. But while Burns has been regularly re-elected ever since, Hardie was defeated in 1895, and it was five years later before he began that service at Westminster which has now been ended by his death. This difference in dates represents a difference in political development. John Burns went to Parliament as a laboring man, with a salary contributed by laboring men, and he had won prominence in the great dock strike. Nevertheless, he embodied an older tradition than Hardie. His entrance into the House showed what success might be achieved in modern England by a laboring man rather than what power might be seized in her councils by laboring men acting unitedly. In Hardie's triumphs, not a man, but a class, pushed its way to the front. There was a difference also in their political temper which was representative of a wide change in the country. John Burns, despite the violence of his early days, was simply a Radical who happened to be a laboring man; Keir Hardie —a natural rebel—was a Laborite and a Socialist, and became Chairman of the Independent Labor party. Burns was made President of the Local Government Board, and only last year President of the Board of Trade, and aroused criticism among his followers for wearing the trappings of his office. Hardie broke one of the traditions of the House by appearing in it, not in a silk hat, but in a Scotch cap. He may even be said to have abolished the tradition, since there was sufficient restiveness under it to take advantage of his boldness, so that now members wear what they please. In their attitude towards the war, the two men are more nearly alike. Burns resigned the Presidency of the Board of Trade because he differed from his colleagues in the Cabinet upon this issue, and Hardie was the leader of the peace element among the British Socialists. More than one of his utterances in Parliament since the war began have aroused bitter comment, and one of the London newspapers went so far as to call his attention to an Order in Council which prescribed penalties for giving aid to the enemy.

THE OUTLOOK IN EUROPE.

In the first weeks of the war, when the stupendous onrush of the German armies towards Paris held the world's fascinated attention, the dominant thought in the general mind was that of the great tradition of German invincibility. Would 1914 be the repetition, on a grander and more awful scale, of 1866 and 1870? That question seemed to be answered at the Marne, in the early days of September. What Prussia had done to Austria at Sadowa, what Germany had done to France at Sedan, was not to be done to the Allies in this culminating test of Germanic prowess. The war was to be a trial of strength not between men and supermen, but between nations worthy of one another's steel. Mighty as the military power of Germany continued to show itself both on the eastern and on the western front, impressive as she was at once in resources, in valor, and in mastery of the art of war, the feeling of the world for many months was that the fundamental factors in the case were against her and were bound in the end to determine the result.

Broadly speaking, this continued to be the prevailing feeling outside of Germany, until the inception of the magnificent German campaign against Russia in the late spring. From the beginning of the Galician drive on the first of May to the fall of Warsaw on the fifth of August, and beyond that, the attention of the world was chiefly centred on an exhibition of German power calculated to revive those ideas of its uniqueness and almost omnipotence which the check administered to it at the Marne had dispelled. The utter disappointment of the early hopes of the Allies at the Dardanelles served by contrast strongly to emphasize this impression. And finally there came, in the one department in which Germany had theretofore seemed an utter failure, developments which appeared to betoken an unexpected success of incalculable value to the German cause. Bulgaria's mobilization was looked upon as a threefold assurance of further signal advance for the Teutonic Powers: it was a victory for German diplomacy, it was a sign that a Balkan Power peculiarly keen in the weighing of chances had come to the conclusion that the Teutonic allies would win, and it was in itself—if it meant what it seemed to mean—a reinforcement of the most signal kind in that quarter of the field in which impending events were of most crucial character. It is safe to say that at no time since the turning back of the first tide of German invasion in France has there been, in this country at least, so near an approach to the acceptance of the idea of German invincibility as there was a week ago.

The beginnings of a reaction had, however, been furnished before that time. For some weeks it had been plain that Russia's resistance had not collapsed, that Germany would not be free to release an indefinite number of troops from the fighting there and use them against Servia or France as best suited her calculations. Then came clear proof that the Bulgarian mobilization was not to mean what it had seemed to mean; Greece had something to say, and the forces of the Entente Powers had something to say. And it was on top of this that the news of the great Allied offensive on the western front came as a reminder of realities which had been lost sight of, but which had all along been in the background. What will be the net outcome of this offensive, whether it will fundamentally alter the position of the German invaders, is a question upon which it would be idle to make predictions. But it is not too much to say that, conjoined with the disappointment of the Germans' hope both of decisive results in Russia and of a radical change in their favor in the Balkans, the manifestation of Allied strength on the western line means an alteration of profound importance in the character of the situation.

In saying this, we have in mind a factor that is too often overlooked in speculations concerning the probable or possible duration of the war. If the war could not be brought to an end satisfactory to the Allies except by the exhaustion of Germany's powers of resistance, the prospect would be appalling indeed; and yet, when anybody suggests a termination short of this, he is almost sure to be told that the Germans are unanimously in favor of fighting to the bitter end, that they will sacrifice the last man and endure the utmost hardship before they will yield. There is no doubt of their patriotism or their devotion. But in this, as in military prowess, they are simply men, not supermen. What they feel, and sincerely feel, to-day furnishes no evidence whatever as to how they will feel if their almost complete confidence in ultimate victory shall have been turned into an almost complete certainty that ultimate victory is impossible. The success of the recent loan was hailed with pæans of joy by the Kaiser and the leading German newspapers not only because it was a proof of patriotism, but quite as much because it was a proof of the people's sure expectation of the triumph of the German arms. Their cheerfulness in subscribing to the loan, their readiness to have the nation incur the debt, was referred not only to loyalty, but perhaps even more emphatically to the certainty that not Germany, but the "guilty nations," would have to bear the burden. When this vision of sure victory fades, when the prospect of staggering indemnities to be paid by England and France is abandoned, when all that can be looked for is at best a continuance of fearful sacrifice of life and treasure, with no compensation in sight, is it not absurd to suppose that the German people will continue to stand "unanimously" for infinite slaughter and suffering? They are, as is evident, by no means unanimous now; but the dissenting voices are naturally hardly heard so long as the ear of the nation is attuned to the sound of victory, past and future. What gives to every serious setback to the German arms a significance truly momentous is not simply its military consequence, but the possibility it holds out of hastening the beginning of that change in German feeling about the war upon which, more than upon anything else, the hope of its termination in a reasonably near future must rest.

ENGLAND'S PROGRAMME OF WAR TAXATION.

In his speech to the Reichstag last month the German Finance Minister, after setting forth that the German Government had determined to impose no new taxes, but to finance the war entirely on borrowed money, made the following remark:

> We do not stand alone in hoping to balance our extraordinary budget without new sources of revenue, or recourse to new taxation. The force of circumstances has compelled England to do the same.

The statement was not correct, even as applied to the budget of taxation adopted by England in the early months of war. Dr. Helfferich himself admitted that the income tax and the beer and tea duties had been increased last autumn, but he laid much stress on the fact that, even so, only 5 per cent. of the British war expenditure was being paid by taxes, as against a roughly estimated 40 per cent. in the Napoleonic conflict, and he concluded, with reference to both Germany and England, that "the only method seems to be to leave the settlement of the war bill until the conclusion of peace."

The budget of new proposals for taxation by the Chancellor of the British Exchequer will put the German Finance Minister somewhat out of countenance. Comparing Mr.

McKenna's estimate of annual revenue under the proposed taxation with the actual receipts for the fiscal year ending March 31, 1914, and accepting his estimate of expenditure in the present fiscal year, it appears that Great Britain will be paying 17 per cent. of its total expenditure out of taxes. Furthermore, since the estimate of revenue affects a twelvemonth nearly half of which is already past, it is clear that, in a fiscal year to all of which the new taxes would apply, the proportion of the total revenue raised from them would be considerably larger.

The increased imposts are distributed with an unsparing hand. Nothing approaching it has been witnessed since the famous budgets of the younger Pitt, at the crisis of the Napoleonic wars. Import duties on tea, coffee, chiccory, and tobacco go up 50 per cent.; on patent medicines, 100 per cent.; new import taxes of 33 1-3 per cent. are proposed for motor cars, bicycles, clocks, watches, and even hats. The sugar duties are increased; rates for postage, telegraphs, and telephones are made higher. Profits from manufacture of war material are taxed at a rate which the dispatches estimate will turn more than half of such profits into the public Treasury.

It is, however, the increase in the income tax which attracts the most attention. In that branch of taxation, the Exchequer's problem was considerably more serious even than that of Pitt. The situation confronting Pitt was one in which no tax on an English citizen's total income was imposed, and in which, therefore, the raising of fresh revenue was relatively easy; whereas Mr. McKenna had to deal with an income tax which was already higher than in any other English war since the struggle with Napoleon. Before this war broke out the rate was sixteen pence in the pound, or 6⅔ per cent.; it was stated to have been doubled last autumn. The Chancellor now proposes a 40 per cent. further increase, which, according to specific cables from London, makes the basic rate in "unearned" incomes no less than 17½ per cent., with a graduated tax running as high as 34 per cent. on incomes of $500,000.

All of last week's advices from London give the impression that Parliament and the people will acquiesce in these heavy burdens, accepting them as the inevitable price of England's participation in the war. That attitude, indeed, seems to have been taken for granted by the Exchequer; for Mr. McKenna, far from addressing soothing assurances to the English public, tells it that, although "we have trebled our debt and doubled our taxes," nevertheless, "if the war continues these proposals cannot be our last word." It is impossible not to contrast the grim frankness thus exhibited by the English Government with the German Finance Minister's remark to the Reichstag, after rejecting the idea of war taxation, that "those who provoked the war, and not we, deserve to drag through the centuries the leaden weight of these thousands of millions." In other words, the German Government makes no preparation to pay the bill, but trusts cheerfully to the war indemnity which it is sure of collecting from somebody else.

This contrast is itself one of the impressive sidelights on the new British budget of taxation. It does not clear up such questions as the economic consequences of these immensely increased taxes, when the war is over, and when the problem of meeting the enormous interest charge in time of peace arises. The similar problem, created by the Napoleonic wars, was solved by the great expansion of productiveness and wealth, brought by the industrial revolution with its steam power and railways. It may be that some economic developments of the future, now unseen, will help in the process on the present occasion. That aspect of the war and its after-consequences embodies uncertainties as obscure in the field of economic history as are the accompanying uncertainties in the field of political history.

Yet the bearing, on the war itself, of the respective attitudes of the English and German Exchequers, is at least suggested by a prophecy from an expert source, made public a year before the war. Assuming a deadlock and an indecisive struggle, this prophecy declared that in such case "success will ultimately fall to him who can boast the highest moral energy and self-sacrificing spirit; or, where on both sides the moral motives are of an equally high standard, to him who can hold out longest financially." This was the judgment of Gen. von Bernhardi.

RUSSIA'S CAMPAIGNS

Less than a fortnight after the fall of Vilna, and when any moment may bring news of the fall of the fortress of Dvinsk and the breaking of the line of the Dvina, it may seem rash to speak of a stiffening of the Russian resistance and a slackening of the German advance. And yet beyond the specific facts recorded in the official bulletins, there is the outstanding impression that a parallel development is under way on both sides. The German forces are abating in the sustained offensive which is the particular genius of the German army. The Russians are manifesting an increase of that dogged defensive which is the particular strength of the Russian army. On their left wing, in the south, the Russians seem actually to have brought the Teutonic advance to a standstill, and are exercising pressure in turn. On their right, in the Riga-Dvinsk region, they have given ground slowly. In the centre, where the Teutonic advance has been most rapid, the rate of progress is declining. The German armies covered the distance of fifty-six miles from Warsaw to Siedlce in just a week, or at the rate of eight miles a day. From Siedlce to Brest-Litovsk they took two weeks for sixty-six miles, or less than five miles a day. From Brest-Litovsk to Pinsk they took three weeks for 110 miles, or a little more than five miles a day. In the ten days since Pinsk was taken they advanced only a few miles. In the same way von Hindenburg to the north took more than a month to cover sixty-four miles from Kovno to Vilna, going just two miles a day.

There are commonplaces which are true and there are commonplaces which are false. What the world has been saying about the fighting qualities of the Russian soldier in the face of continuous defeat is true. What the world was saying for a good many months regarding the genius of Grand Duke Nicholas, in both victory and defeat, apparently needs sharp revision. The achievements of the Russian army since the first of May, when the shattering Teutonic blow fell in Galicia, have been extraordinary. For nearly five months a beaten army has had to face unrelenting pressure which only now gives sign of relaxing, and after five months of retreat with heavy loss over a distance of more than 250 miles, it is still fighting back as hard as ever, beaten but far from demoralized. Foreign observers have attributed this showing partly to the courage of the Russian soldier, partly to the skill of the Russian high command. But in Russia today the inclination is to give credit only to the peasant soldier. The late commander-in-chief's strategy was, from the beginning, regarded with doubt by a large section of military opinion in Russia, including some of the Grand Duke's lieutenants. The collapse of the Grand Duke's plans is now regarded as proof of their essential unsoundness. That, to be sure, is the penalty that always attends failure. But in the present case the fact remains that the invasion of Galicia was always considered by some of

Russia's best professional soldiers as a perilous adventure.

Those who opposed the Grand Duke's forward policy based their arguments on the proved characteristics of the Russian army —that it has seldom been effective in the offensive, that it has always been admirable on the defensive. For years before the war it was the general belief that in the case of a conflict with Germany the Russian army, far from attempting any invasion of Germany, should make no serious endeavor to defend the Polish salient, but should fall back to the Vistula, if not beyond, and let the enemy spend himself in assaults on the Russian trenches. The Grand Duke Nicholas, a man of unlimited self-confidence and iron will, decided otherwise. It is common rumor in Russia that Gens. Russky and Brusiloff, who won the battle of Lemberg and overran Galicia, acted against their own better judgment. They recognized that, while Russia's numbers might give her the advantage in the first months of the war, she had not the sustained energy to conduct an offensive on a large scale. Neither has she the material means, and primarily the railways, for exercising pressure on an immense front. The enemy had that great advantage, and to oppose him with a thinned line from the Baltic along the Polish frontier to the Carpathians was only to offer him a choice of striking-points. Events have shown how completely such a forecast was justified.

Apologists for the Grand Duke's strategy have argued that his views were justified by the necessities of the general situation on both fronts. They say that even in defeat Russia has served the Allied cause well by saving France and England from a crushing defeat. The first Russian disaster in East Prussia, at Tannenberg, by this view, compelled the withdrawal of German troops from the west, and so decided the battle of the Marne. The Russian advance from Warsaw in October, which ended in the defeat at Lodz, served in the same way to relax German pressure against the British around Ypres. But as a matter of fact, it is still to be proved that the Germans did weaken their line in France before the Marne in order to clear East Prussia. The famous five or six corps shipped to the east are as yet an assumption. Nor is it to be supposed that the Germans, in the heat of the fighting around Ypres, drew off troops for von Mackensen at Lodz. A sounder defence for the Grand Duke's policies would be to say that by concentrating against the Austrians in Galicia he was hitting out against much the less formidable of his opponents. But this would be justified only on the supposition that the thrust against the Austrians could be pushed home. The Grand Duke's opponents argued that in the very nature of the Russian psychology and the state of Russia's military efficiency such a consummation was not to be expected.

To-day the situation is, therefore, a return to the original plan contemplated by the Russian generals whom the Grand Duke overruled. It is a sadly tried army that is standing on the defensive and on a line far behind the one originally contemplated. But in the fact that the Russian army is now brought back to the strategy that suits it best, the Russian people find hope for the future. It is recognized that a crisis exists, but there seems to be no inclination to give up the contest. Many of the signs of depression that follow upon defeat are apparent. There is a tendency to cry treason, as in France in 1870. Russia's armies have been led largely by generals of German origin. Von Rennenkampf is held responsible for the first Russian disaster in East Prussia in the first month of the war. Von Rennenkampf's failure to come up in time is said to have saved von Mackensen around Lodz in November, in which battle there were three other generals with German names. The second defeat in East Prussia was inflicted upon a Russian general named von Sievers. We need not take these suspicions seriously. But Russian opinion is finding comfort in the fact that under the Czar as commander-in-chief the conduct of affairs is in the hands of men with good Slav names like Russky and Ivanoff.

A QUESTION OF DECENCY.

It seems plain that the affairs of Dr. Newell Dwight Hillis are to be, for a considerable time, conspicuous in the public eye. They are not a pleasant subject of contemplation. Perhaps in some respects they are not even an easy subject. As usual in such cases, there is much statement and counter-statement regarding matters of fact. And when one has arrived at a probable judgment concerning these matters of fact, there is still room for all manner of estimates as to the degree of blame to be attached to the conduct at the bottom of the facts. Persons of charitable disposition may incline to make allowances for circumstances, real or imagined, which may have led from one step to another, until the minister, at first merely blamable for dabbling with speculative enterprises at all, found himself plunged in a bog, his desperate efforts to emerge out of which resulted only in his sinking deeper and deeper into it. And in like manner, as to his confession and repentance, while some will lay most stress on the fact that these came only under the stress of failure and of pressure from without, others may be inclined to give the minister full credit for sincere and heartfelt contrition.

These questions of external fact, and these appraisals of internal merit or demerit, we shall not undertake to discuss. They are of profound importance to Dr. Hillis's congregation, and, in view of the long-standing prominence of Plymouth Church, they are of legitimate interest to the country as a whole, and especially to all religious bodies. But there is a wider aspect of the matter, one that involves no complexities and which is of far deeper and more general concern. Far transcending the question of how people ought to look upon an individual preacher who has done the things Dr. Hillis has done, and who avows his regret and his purpose to do otherwise, is the question of the standards of decency which they instinctively apply when confronted with such a case. Not the judgment that people finally pronounce upon the affair, but the attitude they manifest towards it, is the really important thing. And in this regard some plain truths ought to be plainly spoken.

We are quite unable to say what impression was made upon the congregation at Plymouth Church by Dr. Hillis's statement and sermon. And whatever impression was made at the moment, under the influence of emotion stirred by eloquence or by a natural commiseration, we cannot say how lasting it may have proved. But there have been several remarkable expressions of approval and admiration by prominent men who were not present. "I think it was Christ-like," said one of the speakers at a meeting of Baptist ministers in Chicago. "You have more friends to-day," declared Mr. Bryan, in a telephone message of cordial sympathy, "than you ever had before."

Now what was this "Christ-like" act, this performance which, in the view of our ex-Secretary of State, has blessed Dr. Hillis with more friends that he ever had before? Nothing, it must be admitted, could exceed the humility which he put into some portions of his talk. But what he was speaking about in those portions was the contrast between his own

conduct and the ideal of the most devoted and self-sacrificing Christian life. "My deepest thought," he declared, "is that there are home missionaries and foreign missionaries and social settlers and neighborhood visitors whose shoe latchets I am not worthy to stoop down and unloose." He had for some years been fearing lest he was biassing students and young ministers "towards the lecture platform, public life, and prosperity, instead of towards obscure, gentle, tender, Christ-like service." But all this sentimental self-abasement does not seem to have been sufficient to prevent him, in his sermon, from dwelling, with obvious allusion to his own tribulations, upon the theme that men grow great through suffering, and from daring to illustrate it by saying that "there was no Iliad until Homer became blind" and that "Jesus was made perfect through suffering."

Now we do not hesitate to say that to like this sort of thing, to accept it as a substitute for a manly and straightforward statement on such a matter as that in which Dr. Hillis has been entangled, argues a lamentable want of appreciation of the peremptory obligations of plain decency. If Dr. Hillis went into the kind of speculations and business transactions with which he is charged, he was guilty, not of failure to fulfil the lofty ideal of the perfect Christian minister, but of conduct which, in any minister of religion, is not decent. This idea does not seem to have so much as found a lodgment in his mind; just as his admirer, Mr. Bryan, was never able to see that there was anything indecent in a Secretary of State of the United States exhibiting himself at so much a night at the travelling Chautauquas. And when Dr. Hillis came to express his regret, it was again a requirement of decency that he should make a plain confession of error, instead of indulging in a lot of mawkish sentiment, either as to his anguished humility over the past or his exalted purposes for the future. There are many very high qualities which we all like to find, both in ministers of religion and in Secretaries of State; but we all know that we almost always have to content ourselves with a distant approximation to the ideal in both cases. The one thing on which we cannot afford to compromise, the one thing that must instantly and irretrievably offend public sentiment if it is in a sound condition, is a violation of those instincts of decency and fitness which are among the most permanent and the most indispensable of the moral possessions of mankind.

Foreign Correspondence

THE ZEPPELIN RAID—CONSCRIPTION: A SUMMARY OF THE ARGUMENTS FOR AND AGAINST COMPULSORY SERVICE.

By JAMES F. MUIRHEAD.

LONDON, September 14.

The Cornish wreckers are said to pray: "Oh, Lord, we do not ask that there should be a wreck, but if wreck there must be, grant that it may take place on our beach!" So without really wishing the Zeppelins to visit the district in which these letters are written, I certainly rather wished to be on hand if a raid actually came. But I reached London, after my holiday in Devon, just too late to witness what my neighbors describe as one of the most marvellous experiences of their lives. The great airships gleaming golden or silvern in the beams of innumerable searchlights, seem to have been as visible as if it had been high noon; and every one has his tale to tell of their apparent size and distance. One military observer asserts that he even made out the guns mounted on their decks. The shrapnel shells from our anti-aircraft guns were seen exploding all round the Zeppelins; and most of the civilian observers feel sure they saw some hits. All agree that the airships finally turned their noses upwards and disappeared behind a cloud, which may or may not have been of their own manufacture. Doubtless some members of the community obeyed the directions of Government and took refuge in the cellars; but the general attitude seems to be better typified by that of a neighbor's cook, who called down to her mistress: "Oh, Mrs. Smith, do come up on the roof! You can see it all much better from here." A number of non-combatants have been killed, a certain amount of private property has been damaged, and our disgust with German methods of warfare has been accentuated; but the military results seem again to be nil, except in the boomerang form of stimulated recruiting. We are not callous to the horrors of the visitation, but our resentment is even deeper than our sorrow, and our determination has been fortified. The assertion that the airships escaped unscathed should probably be taken with a grain of salt.

The question of universal and compulsory national service, frequently disguised under the invidious and misleading name of conscription, is inevitably claiming more of our attention and interest from day to day. It is undoubtedly a matter of regret that, in certain sections of a press that has, on the whole, borne itself with commendable decency and restraint, there has been a tendency to discuss the subject with some acrimony and to endeavor to force the hand of the Government in one direction or the other. At the same time, it is a little difficult for a democratic community to yield unreservedly to the appeal, made by such men as Lord Hugh Cecil and Lord Cromer, for total silence and patient waiting on the Government's decision. It is felt that no Cabinet is omniscient, and that Ministers cannot possibly know the feeling of the country unless it is ventilated to some extent. A certain amount of discussion seems no less excusable than inevitable, and can hardly lead to mischief if carried on in a proper temper and spirit. The question must be decided on its merits and without regard to the good or bad taste of the prominent advocates of either view. If universal national service is necessary for our salvation, we must welcome it whether or no we dislike the little ways of the Northcliffe press. If, on the other hand, it would seem that the voluntary system is adequate to the occasion, we need not pause to consider whether or no the arguments of the *Daily Chronicle* and the (London) *Nation* are often more ingenious than ingenuous. On whichever side we stand, we may remind ourselves that the unrighteous sometimes do right and the righteous sometimes make mistakes. Strange and very imperfect tools have occasionally been used to most excellent purpose.

It is certainly very difficult, at this moment, to gauge the prevailing opinion in Great Britain as to compulsory service. Thus, while the Trade Union Congress has just passed a vote against conscription, it has at the same time expressed its desire for an effective organization of the nation for the victorious prosecution of the war. It is surely inconceivable that, if a moment came when these two pious wishes were in collision, the latter should be allowed to go by the board? So far as my own personal experiences go—and I have made inquiries as widely as possible—I should be inclined to give it as my judgment that, while the nation is not yet convinced of the need of universal service, it would not resent a demand for it, backed by an adequate measure of information as to the reasons for the necessity. Among the so-called "lower classes" I find the predominant (or, at least, very prevalent) feeling to be: "I am quite ready to go when we are all called, but I don't see why I should give up my job when Tom is allowed to stick to his." I have ascertained that the "waiting to be fetched" attitude, which I imagined to be more or less of a journalistic figment, is really held by a very large number of eligible men. They know that, when they themselves want a thing very much, they go and try to take it; and nothing will convince them of their own intrinsic value to the national existence till they feel the grip on their arm or the net over their head. The class of real "slackers" and deliberate parasites is, I think, relatively very small. And even they are not such negligible material as some would have us think. It was a very eminent military authority indeed who said: "Give me a thousand cowards and six months to train them in, and I will confidently meet any thousand untrained heroes you like to bring against me."

It is certainly disingenuous to describe the cry for universal service as a cry for conscription, in the ordinary sense of the word. It assuredly does not mean that every man, married or single, skilled or unskilled, is to be sent to the trenches, irrespective of any thought of his possible greater usefulness elsewhere. What is meant is really systematic national organization for the proper conduct of the war. It means that Government should be entitled to call on every fit man of military age for any services he may be able to render towards this end—military, industrial, or administrative, as the case may be. It would, undoubtedly, put a new and enormous power into the hands of Government; but it must be remembered that this power would be essentially a temporary war-measure, analogous to the various economic and other restrictions we have already submitted to. The idea that any considerable body of Englishmen wish

military conscription for its own sake is, I think, a mere bogey. I should not wonder if fewer now believe in anything like the Continental form of conscription than at the beginning of the war, though there may be some who believe in some form of national military training, similar to that of Switzerland. It would be much nearer the point to talk of conscription to end conscription, just as we talk of this present struggle as the war to end war. It is interesting to notice how the stress of war is sifting out those who possess an idea from those who are possessed by it. It is mainly those who have once committed themselves in print or on platform that seem unable to adapt themselves—unable to see that, for a temporary crisis, very drastic temporary measures may be needed that would be highly undesirable in perpetuity. Doctrinaires and extremists have no place now; we must all be opportunists, in the best sense of that word. We have to realize that a nation organized for war is much less complex than the same nation organized for peace. In war we need to be, so far as practicable, a community of two classes only: those who fight, and those who produce subsistence and munitions for the fighters. The varied forms of consumption so welcome in peace are out of place in time of war. Our desires, like our eye, must be single.

The arguments of the upholders of the voluntary system seem on the whole to be based more on general principles and spiritual grounds, the validity of which is inherently unprovable except by trial; those of the National Service host have at least a plausible air of practical common-sense. It may be true that enforced service is foreign to the genius of the British race, that its introduction would break up the unity with which the nation is now facing the war; but it seems a fair counter to this to say that dire necessity may have to bend that genius to the yoke, and that a unity that does not get enough eligible men into the field is hardly worth preserving. The voluntary system, say those who distrust its adequacy, is wasteful, uneconomical, haphazard, undignified, invidious, and unfair; it gives our allies some shred of reason for thinking we are not bearing our full share of the burden; it is really more disturbing to trade and industry than universal service would be, since it leaves to the accident of individual temperament and impressionability what should be the result of a reasoned system of selection. The argument that anything approaching conscription is undemocratic is met (*inter alia*) by a reference to the American Civil War. President Lincoln was not hampered by fear of the bugbear of consistency when he abandoned the voluntary system; but surely there was no lack of democracy here, and surely the invidious distinctions said to be inevitable between the conscript and the volunteer did not manifest themselves in the Northern armies. It is, I think, realized that, if we are forced to resort to compulsion, there must be no exemption from some form of national service except for actual unfitness; and it is also more or less agreed that there should be no penal clause, such as less pay for the conscript. We cannot make a distinction, through the medium of filthy lucre, between the higher and the lower motive.

While the public is entitled to its thoughts about this important matter, it is, of course, obvious that it does not possess the information necessary for a final judgment. The estimate as to the number of men we now have under arms varies from the 2,000,000 of the gloomiest conscriptionist to the 4,000,000 of the most sanguine voluntarian. We do not know whether or no the War Office is now getting all the recruits it can equip or train. We do not know how many men are necessary for indispensable industrial and agricultural work. But, as already indicated, we may confidently trust that the spirit of the nation is ready, more or less blindly, for any sacrifice of which the necessity is made clear.

THE FALL OF THE INTERNATIONALE—GUSTAVE HERVE ON "BLEATING SOCIALISM."

By STODDARD DEWEY.

PARIS, September 11.

'Tis the final struggle!
Close ranks—and to-morrow
The Internationale
Shall be all mankind!

To-morrow has come and the Internationale lies stark with the other illusions which war has slain. Jaurès must have known it before he was killed. His last appeal to the comrades to force the keeping of peace was made in the name of all mankind—"Humanity," he called it. Their answers were already coming in—"We go with our country!"

Gustave Hervé recognizes the fact: "I don't know where our English Socialist comrades get their bleating Socialism. Hasn't their journal *Justice* been writing: 'The Labor Internationale and not the Pope of Rome has authority in Europe to speak of peace in the name of the peoples and it's not too soon for its voice to be heard! [I re-translate from Hervé's French.]

"Labor Internationale? [asks Hervé]. Where is it? Who does not see that the war has felled it to earth? What have we at present in common—we French Socialists—with the Kaiser's Socialists who have not had one word of protest against the violation of Belgium's neutrality? The proof that she's very dead—our Labor Internationale—is that I who profess to be a good Socialist feel myself a thousand times nearer to a French Reactionary fighting in our trenches than I do to a German Socialist. She will arise perhaps. She shall arise surely, even. While waiting, she's dead. *De profundis!*

"She has just as much authority to speak of peace at this present moment as the traveller whirled away in a lightning train whose brakes refuse to work would have to stop the train. What's the use of bluffing?"

Once started, like his lightning train, Gustave Hervé is not easy to stop. "We wished to try every means, even big means, to prevent war—and those German Socialist idiots, who are politically two hundred years behind us, would not follow us. We did our duty. We have nothing to reproach ourselves with—we French Socialists—for we got ourselves dragged in the mire by trying to prevent the catastrophe. The catastrophe came—and now we can do no more.

"Or rather all we can do is to get the best we can from it for Humanity."

Some of us, from the beginning, were clairvoyant enough to perceive that any Internationale in which Karl Marx and his disciples had a finger would really work for a German mankind. This was Bakunin's prophetic idea when, at the Congress of Basle in 1869, he did his best to get control of the old Internationale for his An-archy—which had at least the negative merit of not playing the game of any particular race of schoolmasters. Then came the German war of 1870 and smashed the Labor Internationale a first time. The Commune of Paris had its last explosive echoes.

Gustave Hervé now goes on to ask: "What is the best we can get from this war for Humanity?" He begins with a recollection which might well touch Americans to the quick and make them ask in turn why, at the Internationale's beginning, American principle and practice were so often cited as an example, whereas now we are ignored. Or else we are passed by on the other side as citizens of a Republic held in fee by that *bourgeoisie* which Karl Marx tried to set permanently over against his Labor proletariat. (And, by the way, what really was the idea of the New Englander Uriah Stevens to whom I remember hearing ascribed at the time—after 1864—Karl Marx's final plan for an international federation of labor?)

This is Hervé's recollection: "Our good ancestors—those of 1848—with the good ancestors of our friends of Italy dreamed of founding by Revolution a new Europe—they called it Young Europe—in which peoples should govern themselves, in which there should no longer be one people reduced to serve another, and in which all the peoples, free and independent, should try to found the United States of Europe.

"The operation failed in Central Europe—in Germany and Austria—where castes and dynasties have kept on governing uncontrolled; and in Eastern Europe—in Turkey and Russia—where bureaucracies have been able to rule regardless of public opinion."

Gustave Hervé, with the usual fixed idea of a Frenchman, imagines the English comrades must "get their Socialism from the Holy Bible" and admonishes them in consequence: "Dear brethren, the ways of God are impenetrable. In His Providence He has let loose this catastrophe that all oppressed people may be freed—the French of Alsace-Lorraine and the Danes of Schleswig and the Poles of the three Polands, Russian, Prussian, and Austrian, and the Rumanians of Transylvania, and the Servians of Croatia, Bosnia, and Herzegovina, and the Bulgarians of Macedonia, and all—Greeks and Armenians and Arabs—whom the Turk oppressor holds beneath his yoke five centuries long.

"His Divine Providence has willed that the two oldest royal families of Europe, the Hapsburgs of Austria and the Hohenzollerns of Prussia, should be discredited and dishonored and thrown into the dustbin; and that Holy Russia should pass gently, without revolution—lo, the miracle is at work before our eyes—from autocratic Czarism to the Parliamentary régime of the Duma.

"And you, O English Socialists! you would have us, soldiers of God, soldiers of the Right, you would have us stay our avenging arm and stop God's finger short?"

Under the whiplash words of irony thus cracked at all pacifists who conspire for the German peace now that the German conquest by force is failing, we hear the honest expression of feeling of what the war's end ought to bring to mankind.

God said, I am tired of kings—

provided only that republics be turned also to ruling the people from above down, like kings, instead of from the town-meeting up

as Tocqueville praised in the Republic of the Fathers.

A union then of honest men,
Or union never more again.

Perhaps the nearest lesson to be retained from this fall of all Internationalism is, after all, the old proverb enshrining the wisdom of the ages—Blood is thicker than water. The universal Church of Christ has never before so nationalized itself. Socialists, whose cause is really that of all peoples and who had their label to protect, now glory in having thrown it to the winds. Pacifists Germanize or announce their conversion to something else. And the latest *Novoye Vremya* bears to us the voice of the Russian common soldier dying for his people. It is told by Father Staphanoff:

"A wounded soldier begged me to hear his confession. He was mortally wounded. With tears that brought tears, he made his self-accusation. Then, when he was to receive the last sacrements, he grasped the priest's hand, pressed it in his own fainting hand, and besought him: 'My father, quiet me for God's love.'

"'Why? Have you something to send to your wife and children? Shall I write a letter for you? Be quieted, I will do all I can.'

"'I have been twice wounded and everything has been done; but now I feel I am dying. I shall not rise again. Say, please, that which will make me close my eyes in quiet.'

"'What is it you wish?'

"'Is it possible they will make peace with Germany? Shall not the war last to its end? Then, why all this blood we have shed, why all these men killed, why all these eyes closed in death? The struggle must be kept up to the end, no matter what it costs.'

"You should have seen the joy and happiness reflected in his eyes and on his face when I explained there had never been any question of concluding peace with the Germans, that all Russians were firmly resolved to conquer, cost what it may, the enemy. Quieted, he made the sign of the cross with his cold hand. And the priest blessed and kissed him."

This may not be Tolstoi, but it is the rude direct logic of the Russian *mujik* repeating, as all those who have suffered in this most cruel war must do, what the refined French mother after the slaying of her last son wrote to War Minister Millerand:

"See that all this bloodshed and sorrow may not have been in vain and that other mothers may not, in the future, have to suffer as we have done."

In a letter from the trenches where the most murderous fighting goes on, I find other words of this natural upright reasoning: "Little more than a year ago not one of us dreamed of going to war. Is nothing to be done to those who have forced us into it? Not one of us wishes for peace until Prussian militarism is crushed for ever!"

It is not probable that all Internationalist theories which put abstract Humanity in place of the country a man knows and loves—they might as well obliterate the man's family—will cease in France. In spite of Hervé, there are still attempts to keep to the old phraseology.

And yet the village churl feels the truth more than you,—
Who's loath to leave this life
Which to him little yields—
His hard-task'd sunburnt wife,
His often labor'd fields,
The boors with whom he talk'd, the country spots he knew.

The Monroe Doctrine

A CONSIDERATION FROM A NON-TECHNICAL POINT OF VIEW.

By W. H. JOHNSON.

There has been some discussion, during the past year, as to whether an invasion of Canada by the Germans would constitute a violation of the Monroe Doctrine, calling for intervention by the United States. This is cited merely as a sample of various theoretical problems concerning this "doctrine" upon which a vast amount of technical ingenuity has been exploited, and perhaps wasted. We are told that in this or that case we must do thus or so, or the doctrine must be given up forever and a new policy put in its place. With especial frequency, of late, we have been warned that if we maintain the doctrine at all we must accept full responsibility for all offences committed in the countries to the south of us against foreign nations or individuals, either making reparation ourselves or exacting it by force from the offender.

All these discussions are vitiated more or less by the effort to apply legal technicalities to a problem which belongs rather to the domain of the ordinary intelligent citizen than to that of the legal or diplomatic expert. The Monroe Doctrine was born not of the law-books, but of a popular conviction, which it fell to the lot of President Monroe to formulate in an official document, that the continued safety and welfare of our own country, together with that of the other young nations which had recently succeeded in gaining an independent existence on this hemisphere, was conditioned by a genuine freedom from Old World domination. The assurance of such freedom demanded not only that no Old World Power should violate the right of any American people to determine the form and conduct of its own Government, but that the American continents should thenceforth "not be considered as subjects for future colonization by any European Powers." These were felt to be the two indispensable prerequisites to that freedom of development for the New World in the desire for which the formulated doctrine had its birth. References therein to "the allied Powers," their "political system," etc., were merely of the time and had nothing to do with the heart of the Doctrine. If the European Powers of the time had been republics instead of monarchies, and had not been allied at all, there would still have been the feeling that they should not be allowed to dominate the destinies of the New World.

Such being the nature and purpose of the Doctrine, the application of it will naturally vary from time to time. It can admit of no variation, however, which would defeat its traditional purpose or destroy its fundamental character. It ought to be evident to any one that its fundamental character and purpose would be destroyed by any interpretation which would make of it an engine for the destruction of the independence of those weaker American countries whose interests were bound up with ours in its inception. It would do rank injustice to the spirit of our forefathers to assume that a genuine altruistic interest in these weaker countries was not a weighty consideration in the matter, and it would be sheer stupidity in the present generation not to see that any attack upon their continued independence, by ourselves as well as by any other, would be a serious menace to our own safety. The purpose of Monroe was in the fullest sense a guarantee of freedom, not a denial of it, and it would be a glaring falsification of history to extend the name of Monroe to any policy which would directly or indirectly reverse this attitude.

This phase of the question gains importance from the frequent assertion of a certain class of writers that we must either allow other nations to enter these weaker countries and forcibly exact reparation for wrongs committed therein against their countrymen, or assume the obligation of satisfactory reparation ourselves. In either case it is evident at once that no real independence would be left to the weaker nation, and that the right of the small nation to exist at all would be seriously endangered on this hemisphere. Present conditions in Mexico have, of course, stimulated acute words and feeling on this point. We are told with emphasis that as soon as the European war is over we shall be obliged either to let European nations enter Mexico and right in their own way the wrongs suffered by their subjects, or forcibly to restore order and justice there ourselves. Permit the prediction that there will be no serious overseas attempt to force our hand in the matter at all, and that we shall do neither. Is it implied, then, that these nations shall have free license to commit or allow within their borders any depredation whatever upon the rights of outsiders? Not at all; but in obtaining reparation there must be such choice of means as is consistent, let us not say with the Monroe Doctrine, which sounds too technical, but with that assurance of free American development which is the object of the Doctrine. In the sad plight of the last two years in Mexico, our own people have suffered far more from lawless assaults on life and property than those of any, or of all, lands across the seas. We have recognized, however, that these assaults have not been perpetrated or instigated by an organized and responsible Government of Mexico, but by lawless bands or individuals whom, unfortunately, there has been no organized government capable of controlling. These disorderly conditions are the not unnatural fruitage of a régime which seemed orderly and successful on its surface, but which utterly failed to prepare the Mexican people for the time when the motive force of that régime should be removed. Some of these days—and there are signs that it will be in the near future—the stomach of Mexico will effectively revolt against any further diet of powder and lead. An era of peace and recuperation will follow, with

freer institutions, greater justice to the masses, and hence less tendency to accumulate dangerous gases under the surface for another disastrous explosion. Under such conditions the chance for a fair reparation for past wrongs, coupled with the possibility of friendly and profitable relations in trade and investment in the future, is certainly a better outlook than anything likely to result from the attempt to obtain immediate satisfaction at the mouth of cannon.

The present revolution in Mexico will not have been altogether in vain if, in connection with a rigidly maintained bar, in accordance with the Monroe Doctrine, against summary military exaction of international settlements, it shall have taught investors due caution in placing their money outside the territorial jurisdiction of their own flag. Mexico needs the aid of foreign capital in her material development. Outside capital will go in if there is apparently a stable government, administered with a fair degree of intelligence and evidently actuated by a desire to do even-handed justice. Such a state of affairs appeals most strongly, not to the gambler, but to the legitimate man of business, whose presence will make for honest and solid development of the community in which his investments are situated. But capital would also go in if there were assurance that in case of disorder or injustice the capitalist could call upon his home government and have his claims (calculated with extreme liberality under such circumstances) exacted for him through a custom house seized by a fleet of Dreadnoughts. This situation would appeal not so much to the sober, constructive business man as to the one of gambling instincts, capable of the secret bribing of officials or financing of revolutions in order to swell claims the realization of which might be made even easier by resultant disorders which would call for the ultimatum and the warship. Now, for the good of Mexico herself, for the best interest of the world at large, under which of these two sets of conditions ought the foreign capital which she needs to be obtained? The peaceful pressure of withholding the outside capital so badly needed, until Mexico can give assurance of a fairly stable and just government, will do more for the healing of her peculiar troubles than any other outside medicine available. And that is just what the proper interpretation and enforcement of the Monroe Doctrine will tend to bring about.

The Monroe Doctrine was the answer of the time to the need of "preparedness" against possible dangers from without. Its preservation now, in its original spirit and purpose, is a more effective answer to the need of preparedness against the perils of the future than any unusual enlargement of our army and navy. And the indispensable condition of its preservation is, as we have shown, a rigid regard for the independence of the nations to the south of us, even though that independence be occasionally abused. To lavish money on big guns and armies and then throw away the chance for a united American sentiment against allowing aggression upon any American state from without befits the brain of a political imbecile, not of a statesman. We may well question either the motive or the wisdom of the man who is vexing the air with continual cries for military and naval preparedness, and at the same time using every energy at his command to thwart the adoption of a treaty which would do all that now can be done to make compensation to a South American state for action on our part involving a very real infraction of the true spirit of the Monroe Doctrine. Let the Western Hemisphere be made and kept truly one in the desire that the whole of it shall remain free from outside domination, and free from any real ground for suspicion that the weaker members of it are in danger of subjugation through the territorial ambition of the stronger, and there can be no real danger of an attempt at conquest of any part of it from without.

And there is no real reason why such solidarity of sentiment cannot be effected. The Spanish-American countries are none of them overcrowded, nor are they set against one another with such age-long and blood-nourished causes of hatred as exist in certain parts of the Old World. Their internal troubles have been numerous, but they are learning the worth of more orderly institutions at a rate which would seem less slow to us if we would consider not solely the conditions in Mexico during the past two years, but also certain periods in the history of most other countries. Not one of them is incapable of realizing the great value of unity of sentiment on the point under discussion. But note that I say "unity of sentiment" rather than any kind of official diplomatic agreement, after the manner of the Triple Alliances, Quadruple Ententes, etc., of the other side of the water. Given the genuine sentiment, and the formal alliance will come if and when necessary. Under other circumstances its utility would be very doubtful. It is, of course, true that the one most serious danger to true unity of sentiment is suspicion of a lurking territorial ambition in the United States. The jingo spirit crops out among us here and there and its display naturally attracts anxious attention in the countries to the south, or in Canada and England; but the attitude of the President towards Mexico during the past two years, and the attitude of the people under his leadership, should go far to prove that jingoism is not the spirit of any large portion of the American people. When the taking of Mexico under our flag would have been far easier than at any time in the past and far easier than it is ever likely to be in the future, when it could have been done with less liability to damaging criticism from the world at large than is likely ever to be the case again, no thought of anything of the kind occurred to the President, no movement in its favor arose among the people. We were, of course, damaged in outside reputation by an act of a former Administration in connection with the obtaining of the Panama Canal route, but we shall yet right the wrong that was then done, so far as is now possible. And from this time on, in view of the sad state of Europe, it should be the earnest desire of every good American citizen to see relations of the sincerest friendship cultivated among all the states of the Western Hemisphere, not with a view to defeating any outside nation or combination of nations in actual war, but of producing and maintaining entirely feasible conditions under which there will be no danger whatever of assault from outside.

The presence of the British Empire on this continent, to the north of us, offers no danger. The absence of defences along the three thousand miles of border, and of warships on the Great Lakes, is an outward indication of friendship and good sense too deep to be broken. As has been said, some have been discussing whether Canada, by sending troops to the aid of Great Britain in the present war, has forfeited any right to protection under the Monroe Doctrine in case her territory should be invaded by Germany. The discussion is wholly beside the point. If by any chance Germany should so far get the upper hand of the British navy, and of her antagonists on land, as to be able to disembark an invading force on Canadian soil, we may rest assured that no hairs would be split over the technical interpretation of the message of President Monroe to Congress in 1823. The President, his Cabinet advisers, and the American people would interrogate their own minds and hearts as to whether invasion like this created any such dangers to the future independence and peaceful development of the American nations as were in the vision of President Monroe when his message was penned. And there can be little doubt as to what the answer of their minds and hearts would be. The judgment of the American people is not likely ever to be convinced that it can be safe for this hemisphere to have a hostile force landed anywhere within its limits by any Power aggressive enough to conceive the project and strong enough to justify a reasonable hope of effecting the landing.

It is, of course, true that this attitude of mind, which seems to me to constitute the irrepealable Monroe Doctrine of the ordinary citizen, imposes a heavy obligation. We must be not only strong against the outside world, but just in our dealings with it. Our treaties must never be "scraps of paper," our compliance with unquestioned provisions of international law must never be sacrificed to a self-determined "military necessity." In consideration of our history, our geographical situation, and the present relations of the various countries of this hemisphere with the world outside, it would be a sad comment on our civilization if such requirements could not be met. And if they shall in any reasonable degree be met, there can be no need to burden the back of industry in the Western Hemisphere with a material acceleration of military and naval equipment.

Poetry

SOME RECENT VERSE.

Poems. By Brian Hooker. Yale University Press. $1 net.

The New World. By Witter Bynner. New York: Mitchell Kennerley. 60 cents net.

Prayer for Peace and Other Poems. By William Samuel Johnson. New York: Mitchell Kennerley. $1.25 net.

A Florentine Cycle and Other Poems. By Gertrude Huntington McGiffert. New York: G. P. Putnam's Sons. $1.25 net.

The Vale of Shadows and Other Verses of the Great War. By Clinton Scollard. New York: Laurence J. Gomme.

The Gates of Utterance. By Gladys Cromwell. Boston: Sherman, French & Co. 80 cents net.

Are Women People? By Alice Duer Miller. New York: George H. Doran. 60 cents net.

Mr. Brian Hooker is, in many ways, an admirable poet. He is a master of technique, of that vigilant and sedulous technique in which there is complicity in every syllable, collusion or privity in every consonant or punctuation mark. One of the earlier poems, "Ballade of the Dreamland Rose," is to my ear almost as subtly cadenced as Swinburne in that special phase of Swinburne where the music springs and gambols in the very wantonness of its enfranchisement from thought. Mr. Hooker, unprompted, might have failed to attain this proficiency; but to reach Swinburne's level even with Swinburne's aid outruns the powers of most of his contemporaries.

At this point, the critic is prone to reflect condescendingly that Mr. Hooker might have been an excellent poet if his vigor of conception and power of thought had in any way matched his technical dexterity. But Mr. Hooker is not a man with whom it is safe to be condescending. To our demand for design and thought, he rejoins presently with "Idolatry," three sonnets of which the intellectuality is manifest; rejoins further with "Morven and the Grail," in which the power of conception is incontestable. He meets every demand with the most obliging and effortless readiness, with a facility, indeed, that is almost too suave and equable. Where things are done with the deftness and swiftness of conjuration, we suspect, too readily no doubt, that the artist is a conjurer.

To say this of Mr. Hooker would be very unfair, but one feels, in the last survey, that something is wanting in this young man of great possessions. Mr. Hooker has kept all the poetical commandments from his youth up, but, if bidden to sell all his artistic goods to feed the poor, I doubt but he would go away sorrowing. He is still supposably young, and the future may reserve for him that final, emancipating, individualizing touch which will convert these insignia into powers. Inspiration, seeking a domicile, could find no chambers better swept and garnished than those offered for tenancy by Mr. Hooker. If the gypsy could only be cured of her perverse fondness for the bivouac or the haystack!

I quote the first sonnet from "Idolatry":

I must forget life ere you shall persuade
  My heart beyond it. Though at last I came
  Without hope to the horror of dark flame,
Or among glad great angels dreamed and prayed,
What matter? Have I not already made
  Love's own lips tremulous to breathe my name
  And seen all night the lidless eyes of shame
Stare through the darkness where I lay afraid?

I should yearn down from Heaven at the voice
  Of a strong child crying out angrily—
  Struggle up from Nirvana for the smell
Of rain-sweet woods in Autumn; or rejoice
  To watch the moon rise over a dim sea,
  Lifting my head serenely out of Hell.

If "The New World" (a revision of a Phi Beta Kappa poem) fairly indicates Mr. Witter Bynner's powers, his work as poetry is hardly superior to that of any well-read, versatile, and dexterous mind, without first-hand access to the springs of inspiration. I am sorry that the cult of novelty should have besprinkled his pages with those queernesses which pass muster in certain quarters for originality; but, dismissing workmanship, let me say at once that "The New World" is one of those comprehensive surveys of men and things from a specular mount which engage the imagination in the measure of its sensibility to the spectacular and the "progressive." A man and woman, intimately bound in love and trust, instruct each other in the gospel of the cohesion, the integrity, of the race. Between the theme and the framework, between a democracy which equalizes men and a love which exalts one of these equals to a primacy beyond that of kaiserdoms or papacies, there is an inconsistency which Mr. Bynner feels and discusses, but hardly resolves. There is a smack of exclusiveness in the very emphasis on democracy; one pictures Celia lowering the shades and saying, "You may go, Jane," to taste with her lover in a more luxurious privacy their common sense of the solidarity of mankind.

Mr. Bynner's ethics are pure and high; if they taper as they mount, that is a fault which they share with elms and steeples and other admirable things; they dispense in a form cleared of dogma an innocent and high-minded, but somewhat pallid, Christianity. Mr. Bynner is not content to call his fellow-man his brother; he says, "He is I, and I am he." He presses this identity too much. Used once, the above phrase may merely prove the presence of imagination. Used three or four or five times, it begins to suggest the absence of understanding.

The following passage treats of peace:

What can my anger do but cease?
When shall I fight and who shall be my enemy
When he is I and I am he?
  Let me have done with that old God outside
Who watched with preference and answered prayer,
The Godhead that replied
Now here, now there,
Where heavy cannon were
Or coins of gold!
Let me receive communion with all men,
Acknowledging our one and only soul!
  For not till then
Can God be God, till we ourselves are whole.

Mr. W. S. Johnson's mainstays as a poet are ingenuity and melody. He favors—rightly, I think—shapely and clear-cut themes, themes of mountain-like profile, with distinct ledges and at times a salient peak. His possession of melody is manifest; the verses are affluent, blithe, spontaneous, the more varied and supple perhaps for the absence of commanding originality. But Mr. Johnson is by no means satisfied with being a builder and a melodist; like Mr. Hooker and Mr. Bynner, his relation to the universe is tutelary; he is nothing if not speculative and oracular.

The brevity of oracles, it is true, he does not emulate; on the contrary, he repoints his points with a perseverance that betrays the most humbling estimate of the perspicacity of his readers. Again his knowledge of the counsels of Deity is quite as precise—and I am willing to believe quite as authoritative—as that which alert journalists display with respect to the secrets of the chancelleries of Europe. Mr. Johnson, I hope, will forgive me for a certain slackness of interest in the messages forthcoming from the special wire which connects his writing-desk with the cabinet of the Almighty. The distance between the terminals may account for a frequent indistinctness, a murmurousness or sibilance, as it were, in the results of these endeavors to "interview" Providence. Furthermore, readers who are neither puritans nor pietists would be grateful to Mr. Johnson if he would refrain from telling God in "The Lapidary" that he, the poet, is indispensable to God's happiness. The fact may be as Mr. Johnson says, but a gentleman has to be thoroughly provoked before he throws dependencies of this kind in the teeth even of his stenographer or of his coachman.

I find the last half of Mr. Johnson's volume, where the mundane and the actual come in for cordial, if tardy, recognition, more interesting and agreeable than his gyrations in the empyrean. "The Egoist," "Strangers," "Mage Merlin's Rule," and "James Lewis" exhibit unquestionable merits in fields of surprising diversity. The sonnet I quote is entitled "The Phaedo" (the italics are mine):

"We owe a cock to Æsculapius"!
  The debt was sacred in the Master's sight,
  His grand concession to an ancient rite;
What though he knew, in speaking Crito thus,
The god a myth, his cult idolatrous?
  He saw in myth and fable, dimly bright,
  The shattered glories of the Primal Light,
And worshipped That, sublimely credulous.
Pay thy least debt of worship! *Soon or late*

The ship comes back from Delos; consecrate
The narrow daylight hours thou hast to wait
To radiant thoughts of immortality,
Then, drinking deep the hemlock bruised by fate,
Pour no libation to the darkening sky!

The titular poem in Mrs. McGiffert's volume, "A Florentine Cycle," has, in its way, a genuine pomp; the cavalcade of stately stanzas mimics the splendor, perhaps the speciosity, of a pageant:

Grave Dante loved it, watched it as 'twas built,
In exile longed for it with yearning eyes;
Its portals are immortal in his heart
E'en now in Paradise.

Oft Petrarch, pausing in its shadow, heard
Ethereal cadences—we hear them yet!
Boccaccio's lute as Fiammetta passed
Do listening worlds forget? . . .

And Beatrice, crowned with roses, bright
With light from inmost heaven softly shed;
And vivid Simonetta, prone, aloof,
And smiling, being dead.

This is post-Tennysonian, of course, and sub-Tennysonian; nevertheless, the unlimited command of this fine orbicular stanza by a minor poet is proof of our advancement in technique. Mrs. McGiffert's admirations are as unfaltering as her rhythms. An inconsequent person like myself, for whom unevenness is a chief index of spontaneity, views with something akin to consternation an admiration so punctual, so punctilious, so rigorously disciplined and impeccably drilled, as that disclosed in the "Cycle" of Mrs. McGiffert; its appetite is large, and its digestion is masterly.

"The Aged Christ" is a brief dramatic allegory, in which, after ample deductions have been made for the indignities it heaps on logic, the reader's heart is shaken, if not wholly captured, by a subtle union of originality and pathos. The other verse reveals substantial merits, not often so effectively combined and concentred as to exalt *values* into *powers*.

The poetry of Mr. Scollard's "Vale of Shadows" is hardly so excellent as the feelings of compassion and indignation, expressed mournfully and now and then a little stertorously in the lapse of its unhesitating stanzas. The volume is readable and timely, however, and the assignment of its profits to the relief of Belgium should strengthen the sympathies of readers.

Next to its beautiful title, the chief attraction of Miss Cromwell's "Gates of Utterance" is a precision, a purposiveness, in the tone, to which I can find no parallel in the images and thoughts. The author's implement is a brush, a rather formless and unwieldy brush, but she poises it like a chisel. The matter belongs to what may be loosely called the literary fourth dimension.

Mrs. Alice Duer Miller is so robust and agile a pedestrian that one laments her ambition to figure in the less congenial part of equestrienne. In plain words, her prose is so much pithier and brighter than her verse that her verse is discredited by its proximity. The prose arguments are pointed and forcible; the verses sometimes reason, sometimes yap. One or two reflections occur to a reviewer of the sex flagellated in these satires. How curious the difference between these jovial and prosperous outgivings, redolent of good dinners and warm fires and social privilege and general well-being, and that state of parity with criminals and lunatics which has been to woman a source of such mortal offence and such unbounded delectation! Again, one asks if the weight of a thraldom can be really crushing when the nominal thrall snaps her fingers or even—I beg Mrs. Miller's indulgence—protrudes her tongue in the face of the nominal oppressor. O. W. Firkins.

Correspondence.

WAR ECONOMIES.

To the Editor of The Nation:

Sir: Would it be timely for some one of your contributors who may have the requisite ability to supplement the "Word to the Moderately Rich," printed in the *Nation* of September 16, with a word about economizing in order to be able to help European sufferers?

People are urged to give up luxuries. Do not other people sometimes have to bear the brunt of attempted self-denials? Women have fewer dresses, and dressmakers have to dismiss their sewing-girls. How many small earners lose their employment when people give up flowers, music, theatre, and other luxuries?

Subscriptions are being withdrawn from work here that sadly needs to be done. The appeal is great and terrible from across the sea.

How are the untrained in economies to untangle the complexities as to the just spending of money? An Old Subscriber.

Cambridge, Mass., September 20.

A RESPONSE FROM ONE OF THE "MODERATELY RICH."

To the Editor of The Nation:

Sir: What makes a man "moderately rich" is a question of definition. Falling within that class as your correspondent "O" defines it, I recognize the justice of his appeal and of your earnest comment upon it. While wondering a little why his aroused conscience should need the further spur of coöperation by nine fellow-penitents, I take great pleasure in meeting his challenge and will contribute the sum he names ($2,000) within the next thirty days to one or more of the war relief funds; particulars and vouchers to be submitted either to you or your correspondent, as may be deemed advisable. I do not insist upon the other eight, but will join with "O" alone, and will not promise not to go forward even though he should recede.

I hope it may not detract from any small merit that may attach to this contribution if I say that it is made possible by the recent advance in the market price of certain "war stocks" which I have been holding as dead assets for so long as almost to have forgotten their existence. Possibly this circumstance may contain a helpful suggestion to some one else.

In this connection I am reminded of a story that I lately heard about a manufacturer of war supplies whose conscience was uneasy over what he knew to be inordinate profits. He said it would do no good to reduce his selling price because the middlemen would absorb the difference. He had, therefore, resolved to set aside for himself what he deemed a fair and legitimate profit and to invest the remainder in British war bonds—a happy combination of real highmindedness with a subtle consciousness that he has a fair chance to get his money back after all. Chicago, September 23.

MARTIN LUTHER D'OOGE.

To the Editor of The Nation:

Sir: Prof. Martin Luther D'Ooge, who died suddenly at Ann Arbor, Mich., on September 12, was born at the village of Zonnemaire, in the Province of Zeeland, Holland, July 17, 1839. His father was of Huguenot ancestry; his mother belonged to a Dutch family that for several generations had followed the profession of teaching. When he was eight years old, his parents, lured by the reports of an Eldorado beyond the sea, with their young children took ship for New York.

In New York and Albany the family learned the English language, and were rapidly disillusioned; in about three years the father found himself swindled out of his meagre capital by a criminal partner. Duped, but not discouraged, he struck out for the West, determined to hew a place for a home in the forests of Michigan. He settled in a clearing about twenty miles north of Grand Rapids. In Michigan there were already many of his countrymen; the Dutch have contributed to the population of the State an element of rare intelligence and stability. When Professor Snouck-Hurgronje lectured at the University of Michigan a couple of years ago he was surprised to find there a small colony of students and professors familiar with the Dutch language.

For a time the D'Ooge household experienced to the full the vicissitudes and privations of frontier life. Then they removed to Grand Rapids, where a high school had already been established. True to the family tradition, the father, now more prosperous, encouraged Martin, although the eldest of the children, to prepare for college.

Young D'Ooge entered the University of Michigan in 1857. In the high school he had had no opportunity to study Greek, and after a year in the University resolved to make up the deficiency. He took private instruction in the summer, entered the Greek course near the beginning of the second year, and soon led his class in the subject. After graduation he served as principal of the Ann Arbor High School for two years, then resigned to enter Union Theological Seminary in New York.

At the close of the second year in the Seminary, Mr. D'Ooge's course was interrupted by an unexpected request to return to the University of Michigan to give instruction in Greek and Latin. Prof. Henry S. Frieze was then in charge of the work in Latin, Prof. James R. Boise of the Greek. Partly from a desire to be associated with men of such eminence, he accepted the invitation, and commenced teaching in 1867.

About this time the first University of Chi-

cago was founded, and Professor Boise was called to its department of Greek; an invitation was extended to Mr. D'Ooge to take up the work which the elder scholar was leaving. He carried it on with such vigor and success that in 1870 he was advanced to a full professorship in Greek.

Always modest and self-distrustful, Mr. D'Ooge felt keenly the responsibility of his position, and the inadequacy of private study to equip him for it. He requested a leave of absence, which was granted, and in the autumn of 1870 he entered the University of Leipzig. Here he found two men particularly helpful and inspiring, Curtius and Ritschl. He received his doctor's degree in two years, and came back to the United States to resume his teaching.

At the University of Michigan Professor D'Ooge remained in continuous service, except for infrequent leaves of absence, from 1872 until his appointment on the Carnegie Foundation, in 1912. In 1886-7 he served as director of the American School of Classical Studies in Athens. This was an eventful year; under the auspices of the school the excavation of the theatre at Sicyon was prosecuted, and negotiations were opened for a concession to excavate the site of ancient Delphi, which for a time seemed to promise success.

A second leave of absence, in 1899-1900, was spent largely in Greece and was utilized in preparing the manuscript of his work upon the Acropolis. Between the two absences, in the years 1889-1897, in addition to his service as the head of a department of Greek which had undergone rapid expansion, he had served the University of Michigan also as dean of the literary department.

Besides articles, educational as well as philological, in several journals, Professor D'Ooge edited two volumes for students. "The Oration of Demosthenes on the Crown" appeared in 1875, and "The Antigone of Sophocles" in 1884. His principal work, "The Acropolis of Athens," appeared in 1908.

Since his retirement from active service, Professor D'Ooge has sometimes joined, sometimes alternated, study and travel. He left, practically ready for the printer, a translation of the Greek text of the arithmetic by Nicomachus.

In his long service as a professor of Greek, Mr. D'Ooge witnessed a change of attitude on the part of the public towards his subject, but also gratifying progress, alike in methods of teaching and in the advancement of Greek scholarship in American universities. No one who heard it will soon forget his address, a valedictory, as it were, on "The Study of Greek—Retrospect and Prospect,"* in which he briefly summed up, for the Classical Conference of March, 1912, the results of his reflection and experience of fifty years as a teacher of the humanities. His closing words were:

"To the modern man, Philistine though he be, the priceless inheritance of Greek literature still has, and will continue to have, a message. The masterpieces of Greek must always appeal to the human mind, steeped as they are in the universal experience of humanity and surcharged with a spirit of idealism that lifts men up to mountain-tops of vision and to inspiring intellectual delights. I can never forget a memorable evening spent in the company of the great English Hellenist, Sir Richard Jebb, and that wide-visioned historian, Lord Acton. The conversation turned upon the future of Greek. Lord Acton was a trifle pessimistic. Finally, Sir Richard said, as nearly as I can remember, the following words: 'If we believe in the progress of humanity, then those studies and pursuits that belong and minister to the highest and best part of man must not only survive, but in time must become more and more dominant. I believe in the future of Greek because I cannot disbelieve in the intellectual and spiritual progress of the race.'

"If we share in this belief, we can bide our time, and we can patiently endure the trials of the sway of commercialism and Philistinism. Meanwhile, let us keep burning the sacred fire upon Athena's shrine, until it shall flame up anew more pure and bright in the better future!"

Recognition came to Professor D'Ooge through the presidency of the American Philological Association, in 1884, through membership in other learned societies, and through the usual academic distinctions. But no formal statement can convey an expression of the appreciation of his work and influence by those who knew him best. Fitting are the words of President-Emeritus James B. Angell, who lately wrote:

"His grateful pupils are scattered over the whole country, remembering thankfully his beautiful character as well as his delightful teaching. His frank and winsome temperament linked him closely to all his associates and friends by the strongest ties."

FRANCIS W. KELSEY.

Notes from the Capital

CHARLES E. HUGHES.

With chest well out, head held erect, full beard breasting the wind, arms loosely swinging, the face of one who is at peace with the world, and the gait of a happy marcher, here comes Charles Evans Hughes, walking down Capitol Hill at the close of a day's work. Had you looked in upon the Supreme Court an hour ago, you would have heard him deliver an opinion on an appealed case of much importance. The attendant who opened the door of the court-room for you could not see the bench from where he stood, but he could have told you without an instant's hesitancy who was speaking, for Mr. Justice Hughes has a flexibility of voice, an ease of address, and a distinctness of utterance unusual in this august tribunal. The rest of the black-robed men seated on the dais against its background of crimson hangings may say as momentous things as he, but, as a rule, only a trained ear can make sure of their words. The room has poor acoustic properties at best; and these exponents of the law, most of them unpracticed in oratory to start with, and some having lungs that are not of the strongest, have fallen into a habit of either rattling through their deliverances in great haste or mumbling in their throats.

His voice and his enunciation are typical of Hughes's personality generally. He is a man of plain thought and manners, cheerful temper, and businesslike ways, with a trait of positiveness which you would scarcely suspect from his urbanity of demeanor in an ordinary discussion. Depend upon it, what he knows he knows, and what he thinks he thinks; and, although I suppose he could be persuaded to change his mind if he encountered an adversary in debate who was a far keener logician than he, it would be only after a determined struggle. Certainly no one could bully or wheedle him into a conclusion towards which he had not been headed by his own mental processes. It is equally safe to say that, although it may be possible to rip one of his judicial decisions to pieces, its weakness will not be found due to his having neglected to take into account any of the arguments presented by counsel. On that score his scrupulousness is perfect. Nor will the shrewdest inquisitor ever draw from him an inkling of his views on any litigated or presently-to-be-litigated question. He is not only always on his guard against approach through the obvious channels, but even a request for his personal opinion on some matter which has not yet given a sign of coming within his province as a judge is liable to be met with a polite and pleasant, but quite unmistakable, rebuff. At first thought, this would seem likely to put an extinguisher upon social conversation; but it does not, and the chances are nine to one that, when you come to look back upon it, you will understand and approve his attitude. He has simply seen further into the future than you.

A cold man, many pronounce Hughes, because he does not carry his sympathies on the surface, where every one can see and read them. That is part of his life-training in self-control. No man who has had to handle the interests which have fallen under his direction during the last ten years could have done his duty by them if he had allowed his feelings to interfere with his judgment, or even to share its operations. That would have meant taking his worries to bed with him, and before now he would have been nervously worn out and fit only for the human scrap-heap. As it is, his burdens of every day are laid aside at its close; and when he composes himself for rest, it is for real rest, which brings refreshment of mind and body for tackling whatever the next day may hold in store for him.

No American who has performed as many and as distinguished public services as Justice Hughes can hope to escape being "mentioned" as a candidate for the Presidency, and the amateur President-makers have been busy with his name from the day that he began to attract notice outside of his own political balliwick. While he was Governor of New York he raised no objection to their activity; indeed, for one period he frankly encouraged it. But since he has been on the bench he has frowned upon everything of the sort. The judiciary must, according to his code, be entirely divorced from the business of giving and receiving public honors of any other kind. As he once cleverly put it, he was unwilling to invite the possibility of any political party's capitalizing his decisions, or to countenance what might drift into a most demoralizing practice, if judges generally were willing to stand as candidates for elective offices, and thus lay their decisions open to the suspicion of having been rendered with a view to future contingencies personal to themselves. And a man who, as Governor, had the courage to refuse to name the delegates-at-large from his State to the convention which held his fate in its hands, on the ground that their choice belonged to the people, is not very likely to be misinterpreted when he says "No."

TATTLER.

Literature

THE DARWINS AND THE WEDGWOODS.

Emma Darwin: A Century of Family Letters. Edited by her daughter, Henrietta Litchfield. 2 vols. Illustrated. New York: D. Appleton & Co. $7.50 net.

The first of these volumes is almost entirely concerned with the Allens and Wedgwoods. Each was a prolific and energetic stock. Perhaps a part of the vivacity of the Allen daughters was due to peculiar home training. Surly old John Allen used to thump the table and bid his girls be amusing. They were so, both in and out of the family. One of them married Josiah Wedgwood. Another became the wife of Sismondi, the historian. Sir James Mackintosh espoused Catherine Allen. All of the sisters kept up an active correspondence with each other and with their wide-branching relatives. The letters were passed around, were usually undated, and their sorting out and identification was the patient work of the late R. B. Litchfield during a long illness. Of the whole mass, the chief notes are marked family affection, open-mindedness, and sturdy moral independence. Gradually the Wedgwood connection comes to predominate. The Wedgwoods, wrote Emma Darwin, when reading Emerson late in life and trying to like him, "have no intuitions." If not, they had almost every other kind of endowment and talent. There was Tom Wedgwood, for example, who died at thirty-four of a baffling disease, yet who impressed all who met him—many of them good judges—as one of the most remarkable men of his time. Darwin's mother was a Wedgwood, and he married Emma Wedgwood, his cousin.

The Allens and Wedgwoods saw a good deal of the notables of their day. To some of these there are glancing allusions in the early letters. Jessie Allen wrote of the disappointments in meeting famous men. "The fact is, I have very little pleasure in their company; after all, they put forth their best in writing. I would much rather read their works; that is surer than their society, which fails in giving one pleasure six times for once that it succeeds." Yet it was at one of their family dinners that Wordsworth and Jeffrey were brought together. At first Wordsworth demurred. "We are fire and water, and if we meet we shall only hiss; besides, he has been doing his best to destroy me." But poet and critic finally met, and "the two enemies liked one another's company so much that when the rest of the party broke up at past eleven, they remained talking together . . . till one o'clock." "Mr. Lockhart said it was the best thing he ever saw done." Great freedom of speech prevailed in the Wedgwood home. A visitor wrote: "I never saw anything pleasanter than the ways of going on of the family. There is no difference in politics or principles of any kind that makes it treason to speak one's mind openly, and they all do it." One of the most strong-minded daughters, Sarah—whom some thought eccentric and almost ill-balanced—wrote in 1817 of "Lord Byron's last volume of poetry": "I suppose one ought to admire that goodness which makes people insensible to beautiful poetry because the writer behaved ill to his wife, but I can't find it in myself." Yet it was one of this vigorous sisterhood—this time, to be sure, an Allen—who, writing to her niece from Paris in 1815 of her visit to the Louvre, said: "I feel still rather uncomfortable staring at naked statues with men all round one."

The Darwins begin to figure in the first volume, but it is only at the end of it that Charles appears as a possible suitor of Emma Wedgwood. She preserved some rough notes of Darwin's, written probably in 1837, which she docketed "C. D. on marriage." They showed how the rising naturalist was weighing for himself the advantages and disadvantages of married life. Thus on one side: "Children (if it please God), constant companion (and friend in old age), charms of music and female chitchat." But, per contra, "*Terrible loss of time*, if many children, forced to gain one's bread; fighting about no society." The conclusion, however, was not far away: "My God, it is intolerable to think of spending one's whole life like a neuter bee, working, working, and nothing, after all. . . . No, no, won't do. . . . Only picture to yourself a nice soft wife on a sofa, with good fire and books and music perhaps. . . . Marry, marry, marry, Q. E. D." Practice did not lag behind theory. Charles Darwin became engaged to Emma Wedgwood in 1838, and married her January 29, 1839. She was thirty years old, he a year younger.

Mrs. Litchfield writes: "No letters from my mother to my father have been preserved, either before or after marriage. Whether she destroyed them on his death, or whether he did not keep them, I do not know, but he had not the habit of keeping letters except those of scientific interest." Several letters of Darwin to Emma Wedgwood were kept, of which a selection is here printed, as are many to her after she became his wife, and to their children. They are all of a piece. The simplicity, the entire sincerity, the deep capacity for affection, the delicacy and scrupulous honor of Charles Darwin, already left far beyond question in the "Life" by his son and in the "More Letters," here shine out again. As Emma Wedgwood writes to her aunt, Madame Sismondi, when announcing her engagement: "He is the most open, transparent man I ever saw, and every word expresses his real thoughts." Yet he was not without a vein of playful humor. Writing to Emma of a visit at the Lyells', he said: "I was quite ashamed of myself to-day, for we talked for half-an-hour unsophisticated Geology, with poor Mrs. Lyell sitting by, a monument of patience. I want *practice* in ill-treating the female sex. I did not observe Lyell had any compunction; I hope to harden my conscience in time: few husbands seem to find it difficult to effect this." Darwin, however, never succeeded in effecting it. His life long he was the most considerate of mortals. His wife was fond of the theatre, he was not. Emma wrote to her aunt: "The real crook in my lot . . . is that he has a great dislike to going to the play, so that I am afraid that we shall have some domestic dissensions on that head." It was a needless fear. Darwin adjusted himself to his wife's desires in every possible way. He even sought to shelter her from the boring winds of science. In his life-work she was a real helpmeet. She read to him when he was too ill to read himself, and was even able to aid him in translating scientific German. But, frankly, she had no taste for his pursuits. His fame she took placidly: "I sometimes feel it very odd that any one belonging to me should be making such a noise in the world." Once at a lecture at the British Association, Darwin said to her: "I am afraid that this is very wearisome to you." Her quiet answer was: "Not more than all the rest." And she was too bravely direct to pretend to care for things, whether in science or literature, simply because it was considered correct to do so. She even withstood the Shakespeare convention, finding parts of him "tiresome." A favorite aunt of hers had declared that Emma would "lark it through life." This might give a wrong impression. She had not high spirits, but she had a high serenity, with a heart equal to any fate. Her married life was not a long day-dream. She had ten children, some very delicate; and three of them died. Her husband was a chronic invalid. The tax upon her strength and patience was severe. Yet she had the secret of happiness and contentment, and her marvellous inherited vitality kept her well and active at the age of eighty-eight.

The family life of the Darwins was exceptionally beautiful. Never can there have been more free-flowing affection between parents and children. Darwin's letters to his sons are as abundant in easy good-fellowship as they are in thoughtful kindness. And he loved to have the children near him. Julia Wedgwood used to say that the only place in the Darwin house where you could be sure of not meeting a child was the nursery. "Many a time," notes Mrs. Litchfield, "even during my father's working hours, was a sick child tucked up on his sofa, to be quiet and safe, soothed by his presence." In the letters which Darwin wrote to his wife, at the time of the illness and death of their daughter Annie—which occurred away from home, where Mrs. Darwin was unable to go—we have a revelation of fatherly love wonderful and almost sacred. Twenty-five years later, in his "Autobiography," he wrote unaffectedly: "Tears still sometimes come into my eyes when I think of **her sweet ways.**"

Perfect as was the sympathy between Darwin and his wife in nearly every respect, there was a lack of complete seeing eye to eye in the matter of religious beliefs. Emma Darwin was no bigot. She was not even an intense evangelical. Indeed, as her daughter remarks, her own theological conceptions changed greatly in the course of her long life. Yet her heart was a fountain of Christian faith, and she did not conceal the fact that she was troubled by some of the tendencies of her husband's scientific teachings. When "The Descent of Man" was coming out, she wrote to her daughter, then abroad: "I think it will be very interesting, but that I shall dislike it very much as again putting God further off." Shortly after her marriage to Darwin she wrote him two letters —she could not bring herself to talk—on the subject of their religious views. They are too long to quote, but they breathe a beautiful spirit—all tolerance, all uttermost love for her husband, with just a faint beseeching that he might not too rigidly apply scientific tests to matters "above our comprehension." No wonder that Darwin called these letters "beautiful." He preserved them carefully, and apparently took them out to read over occasionally, for on one of them is written the line: "God bless you. C. D. June, 1861."

The life at Down was necessarily a good deal self-centred, on account both of Darwin's poor health and the absorbing nature of his studies, yet contact with the outside world was not infrequent. For one thing, visitors were attracted by the naturalist's fame. Not all of these were angels unawares. Thus Emma once wrote to her son Leonard: "We have been rather overdone with Germans this week. Haeckel came on Tuesday. He was very nice and hearty and affectionate, but he bellowed out his bad English in such a voice that he nearly deafened us. However, that was nothing to yesterday, when Professor Cohn (quite deaf) and his wife (very pleasing) and a Professor R. came to lunch—anything like the noise they made I never heard." The Carlyles figure in the letters. Darwin thought Thomas Carlyle "the best worth listening to of any man I know." But "I find I cannot get up the due amount of admiration for Mrs. Carlyle." For one thing, she spoke Scotch hard to understand. Moreover, she had "an hysterical sort of giggle." Then she was "very far from natural." Emma Darwin had an even stronger adverse opinion: "What a coarse woman," she wrote in 1883, apropos of the "Letters and Memorials of Jane Welsh Carlyle." She at once added, however: "But one gets fond of her through everything." Here is a little sketch of Carlyle in an unusual scene: "Hensleigh and Fanny had a pleasant dinner-party yesterday [May 4, 1845] of the two Carlyles, Mr. Wrightson, and Mazzini, who was clever and just in a dispute with 'Thomas' about music. . . . T. C. could see nothing in Beethoven's Sonatas, 'It told nothing.' It was like a great quantity of stones tumbled down for a building, and 'it might have been as well left in the quarry.' He insisted on Mazzini telling him what he gained by hearing music, and when Mazzini said inspiration and elevation, Carlyle said something not respectful of Beethoven, and Mazzini ended with *Dieu vous pardonne.*"

Darwin the scientist is naturally in abeyance in these pages. The most humane of men, notorious for the indignation with which he would witness or hear of cruelty to animals, he yet had scant respect for the movement against animal experimentation. If it were stopped in England, he believed that it would make English physiology fall far to the rear. In a letter to his daughter in 1875 he said that she had led him to "think over vivisection," and added: "I wish some new word like anæsection could be invented." Writing earlier (1871) to his son Horace, he remarked: "I have been speculating last night what makes a man a discoverer of undiscovered things; and a most perplexing problem it is. Many men who are very clever—much cleverer than the discoverers—never originate anything. As far as I can conjecture, the art consists in habitually searching for the causes and meaning of everything which occurs. This implies sharp observation, and requires as much knowledge as possible of the subject investigated." So much for the secret of Darwin!

On his death-bed Charles Darwin said to Emma—she wrote down his words soon afterwards: "I am not the least afraid of death." "Remember what a good wife you have been to me." "Tell all my children to remember how good they have been to me." Mrs. Darwin survived him fourteen years, and her old age was one of serene beauty. Active, reading more than ever in her unwonted leisure—in 1894 she wrote to her daughter: "I am rather ashamed to find I use up rather more than a volume a day of novels"—she was at once the blessing and the pride of all her descendants. She died October 2, 1896, without illness and without warning. We need say only a word of the filial piety and scrupulous taste with which her daughter has edited these letters. They were intended as only a private family publication. But the decision was wise to give them to the world. We cannot have too many such records of human nature at its best.

CURRENT FICTION.

The Money Master. By Gilbert Parker. New York: Harper & Bros.

Sir Gilbert here repeats himself with excellent effect. Indeed, the old story is retold with so much gusto that we incline to doubt whether he himself realizes its elderliness. To a reader unfamiliar with "When Valmond Came to Pontiac," "The Pomp of the Lavillettes," or their companion-pieces, this might seem a creation of singular freshness and charm. Whatever we may think of Sir Gilbert's art, there is no denying his unction.

Nevertheless, whether consciously or not, he works upon a pretty narrow formula. Well he knows, or senses, the limitations of his audience, the many-headed and chuckle-headed populace. Well he understands that nothing is safer than to give it what it is used to, in slightly altered dress. And he finds satisfaction, even exhilaration, in his own easy mastery of the process. For he is essentially an entertainer, not an artist —a performer always conscious of his audience, and determined to keep them "with him." That he thinks himself a serious artist (as we believe he does) goes far towards insuring the continued zest of his performance.

St. Saviour's is a French-Canadian parish, very much in the country, of which a leading member, almost the leading member, is Jean Jacques Barbille, "miller and money-master." He is of decent Norman stock, and has inherited from several generations of *habitant* ancestors a good property and a vast conceit of himself. The little learning snatched from a year at a local university has dangerously increased his pride. He has a quick mind, but little power of co-ordination, fancies himself a philosopher, and is really no more than a self-centred sentimentalist. At thirty, on the voyage home from a "grand tour" through France, he meets and is romantically united to a beautiful Spanish girl. Of more than doubtful extraction, she is capable of good; but Jean Jacques is too much of the romancer and too little of the lover to satisfy her passionate need, and, after a dozen years, she leaves him and their only child, a daughter, upon whom thereafter he centres his affection. She is to leave him in her turn; and presently the fortunes of Jean Jacques begin to crumble. One misfortune follows another, till finally all is lost but a few hundred dollars left him by generous creditors. He sets out upon a vague pilgrimage, in the course of which he miraculously stumbles upon his dying wife, and later upon the grave of his daughter.

The long arm of coincidence is, according to Sir Gilbert's usage, recklessly extended throughout the narrative. Persons are always entering the room at the crucial moment, or chancing to witness the fatal embrace, the chance being a thousand-to-one shot. But this is all in the day's work to an entertainer who has command of his audience. Jean Jacques, the gasconading but not ignoble hero, so familiar in the work of this popular romancer, moves creditably, if not credibly, upon his appointed scene, with fitting entourage of village worthies, chief among them an old Clerk of Court and the inevitable Curé. Most genuine as well as most endearing among them is the simple-hearted, yet not foolish, Virginie Pouchette, who gives the travel-worn Jean Jacques an aftermath of happiness in his declining years.

The American Historical Association

A REPLY TO MR. BANCROFT.

By Edward P. Cheyney,
Chairman of the Board of Editors of the "American Historical Review."

To the Editor of The Nation:

Sir: The letters of Messrs. Phillips, Bancroft, and Latané in the *Nation* of September 16, following upon Mr. Bancroft's pamphlet, issued some weeks before, may seem to call for some reply on the part of the editors of the *American Historical Review*. An adequate and satisfactory reply to any charges of impropriety can, of course, readily be made. It would seem, however, that, as there will be abundant and early opportunity to discuss the whole matter at the general meeting of the American Historical Association in Washington in Christmas week, it were scarcely worth while to attempt to correct misstatements or explain misunderstandings in the columns of a public journal.

Nevertheless, it may be said in a general way, first, that opposition on the part of the editors to having the *Review* brought entirely under the control of the Association is quite mythical. They have made no such opposition. As a matter of fact the Association pays somewhat less than one-half of the expense of the *Review*, the remainder comes from other sources. In 1898 the Historical Association refused to take over the *Review* completely from the board of guarantors by whom it had been supported during the first three years of its existence, and left the responsibility for its financial support in the hands of the board of editors. At no time since, probably, have the successive members of the board been unwilling to relieve themselves of that responsibility, and turn over the financial and other control of the *Review* to the Association. Secondly, the practice of paying the carfares of the members of the board of editors to and from its three meetings a year was established at the foundation of the *Review*, when the members of the board were Professor Hart, of Harvard; Professor Sloane, then of Princeton; Professor McMaster, of Pennsylvania; Professor Stephens, of Cornell; Prof. George B. Adams, of Yale, and Professor Judson, now president of Chicago. Hotel expenses have never been paid. The custom was doubtless borrowed from the very general practice of learned societies and educational institutions, which, when they call upon certain members to perform unpaid duties at a distance from home, usually pay their travelling expenses. This is done, no doubt, partly from a sense of fairness, partly for the practical purpose of obtaining a fuller attendance.

Thirdly, at no meeting of the board of editors since the present writer has been a member has there been any discussion whatever of the general affairs of the Association, nor any mention of the candidacy of any one for any office. On the contrary, the meetings of the board, both that held at the time of the annual meeting of the Association in December and those held in May and November of each year, have proved none too long for the discussion of plans for the *Review* and its contents, and the settlement of questions submitted to the board by the managing editor. But all these and similar questions of fact, policy, practicability, and official duty can be most fully, freely, and satisfactorily discussed and determined upon at the general meeting of the Association. In the meantime as a contribution to clear knowledge of the subject the board of editors has prepared a plain and somewhat full statement of the past and present relations between the *Review* and the Association which will be sent to all members very shortly.

Recurring to the letters in the *Nation* and to the quotations in that of Mr. Bancroft, it would seem that some members of the Historical Association have not submitted recent polemic documents to the processes of verification, examination of probability, analysis, tests for obsession, and the other forms of sober criticism to which they habitually subject other historical documents with which they deal.

A FEW FACTS.

By Albert Bushnell Hart.

To the Editor of The Nation:

Sir: Observers in the trenches report that the thing that most tries men's nerves is the interval between the flash of the shell and the explosion. Such a tension has been the lot of those who have for months been aware that Dr. Bancroft and his friends were preparing a Zeppelin for the benefit of the American Historical Association. The suspense was relieved when a few weeks ago Dr. Bancroft, Professor Latané, and Mr. Rowland launched their craft by a printed circular, and still more relieved when, in the *Nation* of September 16, Dr. Bancroft, Professor Phillips, and Professor Latané printed picric acid letters. For it now appears that all their charges of dread deeds and backstairs influence are reducible to matters widely known by anybody who was interested (although apparently still cryptic to Dr. Bancroft), and to money transactions which are equally a matter of record and which reflect no discredit on any person.

I.

The three matters upon which the various detectives have filed reports are: The organization of the American Historical Association, the organization of the *American Historical Review*, and alleged financial irregularities. On all those questions I have personal knowledge, having been at various times an officer of the Association, one of the editors of the *American Historical Review*, and a participant in the payments which horrify the souls of the "Reformers."

The American Historical Association is a society open to any respectable person on payment of $3 a year. The 2,900 members naturally do not all come to the annual meetings; only from 100 to 400 appear at these conventions. Out of that 100 to 400, a relatively small group in each year carries on the business of the Society. It is so in most learned societies, such as the American Economic and the American Political Science Associations.

To the minds of Dr. Bancroft and his associate detectives, this system sustains "an oligarchy which has distributed offices and honors out of its own self-chosen group." That charge may be quickly checked from the names of some of the officers during the last twenty years. Will any one in his senses assert that the following men were elected presidents or vice-presidents of the Society to serve the purpose of an oligarchy?

George Frisbie Hoar, Richard Salter Storrs, James Schouler, George Park Fisher, James Ford Rhodes, Edward Eggleston, Charles Francis Adams, Alfred Thayer Mahan, Henry Charles Lea, Goldwin Smith, Simeon E. Baldwin, Theodore Roosevelt, Moses Coit Tyler, Herbert Baxter Adams, Edward McCrady, Edward Miner Gallaudet, Melville Weston Fuller, Peter White, A. Lawrence Lowell, George L. Burr, Reuben G. Thwaites, Worthington Chauncey Ford.

In the last ten years, the six elected councillors, and the vice-presidencies and presidencies, have usually gone to professors of history; and that is the only accusation that sticks.

It can hardly seem criminal to the two professors who have signed the charges. Meanwhile, I am free to say that I think the practice has been injudicious, and (since passing through the process myself) I have urged a change. Others have taken up the idea more effectively, and the result was an attempt to get out of the rut by the appointment of Dr. Bancroft to the Council, and that has given him "the time of his life."

The work of the Association, as in every such society, is to a large degree thrown upon the secretaries and the treasurer. The Council can meet only twice a year to discuss the welfare of the Society. The Association has an admirable system of standing committees and commissions, which receive small money aids from the treasury for clerical expenses; or, in some cases, for railway fares to commission meetings. The chairmen of these committees are invited to the regular November Council meeting, where they discuss, but have no votes. This Council is the body which is supposed to be an "oligarchy." In fact, there are few societies in which the discussions and decisions are more open and above board, and more inspired by a desire to advance the cause of learning. This system is as far from being a secret oligarchy as anything can be imagined, for four groups participate: the officers of the Society for the year, the elected councillors, the ex-presidents, and the chairmen of com-hundred.

The Council furthers the principle of the short ballot by appointing the members of the commissions and committees, who have to be selected with a view to their special fitness for the job. This is the chance to bring into service the rising young men who ought to share the honors of the Society. Personally I have for some years felt that the process might go farther; that more pains might be taken to search for talent, both inside and outside the academic ranks; but the actual number of individuals who have been from first to last designated by the Council to serve on such committees runs near two hundred.

The addition of the ex-presidents to the Council dates back to the infancy of the Society, and has been continued until the number of living ex-presidents is fifteen. Surely those who have had the delight of seeing President White and James Schouler and Admiral Mahan at these meetings will not think it a bad system. I have never known a case in which the ex-presidents made or

contributed to making a majority which overrode the elected councillors and officers. The real complaint of the reform syndicate appears to be against the professorial ex-presidents, who value the privilege of meeting their brethren and taking part in discussions, but who would have no objection to the status of invited guests, which is the practice of the Political Science Association.

Professor Phillips is sure that there is "Boss and Ring Rule in the Council." I have at various times tried to boss the Council to the extent of making it take my sagacious advice, with no adequate result. In every such society a few persons must carry on the business and are likely to represent the traditions. It is undesirable that the same persons should occupy the two important functions of editors of the *Review* and voting members of the Council, but that can be easily remedied.

II.

Of the affairs of the *American Historical Review*, I can speak with some confidence, having been one of the founders in 1895, when the American Historical Association would take no action looking towards an historical journal. It is quite true that the first six editors came from six large universities; and likewise true (though not stated in the detectives' notes) that through their efforts they raised a good part of the $10,000 which made the journal possible. At the end of three years, a favorable arrangement was made by which the Association subscribed for the *Review* for each of its members at a price of $2 a year (subsequently reduced to $1.60 a year).

This favorable arrangement was much aided by the courtesy of the Carnegie Institution, which gave office space for the *Review* and permitted the director of their department of historical research to give at least half his time to the editing of the *Review*. That arrangement, known to anybody interested enough to ask, is the agreement about which Dr. Bancroft says he has "in vain sought specific information."

To take advantage of the offer, the board of editors chose a managing editor, the director of the Carnegie Institution, who at that time was Professor McLaughlin. When Professor Jameson took his place, he was elected managing editor and has so continued. It is difficult to see anything underhand or mysterious about this. If any other person except the director of the department of historical research of the Carnegie Institution were chosen managing editor, it would be necessary to make provision out of the funds of the Association for office room, office expenses, and the salary of a competent man, which the Association presumably could bring about at any annual meeting, if it thought wise; but up to this time nobody has protested against a method which has so many obvious advantages.

One of the conditions of this three-cornered arrangement was that the Council of the Association should appoint the editors of the *Review*. The board of editors has usually indicated the man that it would like for a vacancy, partly because of the necessity of keeping the balance between the fields of history. I have thought and said for years that the number of editors ought to be at least seven instead of six and that the managing editor ought not to be one of the elected editors. Eight persons would distribute the responsibilities and honors of the place more than six.

As one of the persons who had a hand in making the three-fold agreement, it has lain in my mind ever since that the ultimate control of the *Review* must necessarily be in the Association, which through the Council chooses the editors. The Association and the *Review* are parts of one effort to bring the historical forces of the country into line for common action. There may be differences of opinion as to the best way to organize the editorial board, and as to ownership of the very small property and abundant good will of the enterprise. There can be none as to the honesty and public spirit of those who are now carrying on the *Review*, in behalf of the Association and of scholars in general.

III.

As for the charges of meanness, concealment, and petty graft which Dr. Bancroft brings against the present and past editors of the *Review*, and which are the main staple of his circular and his letter to the *Nation*, I repudiate and deny them from top to bottom. The honor of being one of the editors, any historical scholar in the country would appreciate. Few of those who have accepted it have shown unwillingness to give the considerable time and attention required; and for all it has been a labor of love. The conduct of such a journal is much aided by personal meetings of the editors. Without them, it would inevitably become a one-man affair.

It is not reasonable to ask the editors to put money of their own into an enterprise carried on for the benefit of the whole Association. Therefore, several meetings of the editors are held every year, as many as the editors think necessary, without asking Dr. Bancroft's previous permission. A December meeting is especially necessary because selection can at once be made out of articles from the papers read at the meeting. The editors have the opportunity to put in accounts for their "railroad fares and necessary Pullmans." This arrangement has made possible the presence of editors from distant parts of the country. The American Historical Association has never paid a dollar of these expenses; they are provided for by the allowance made for that and other editorial purposes by the publishers.

I do not know who is the "recent president who, in the course of his bashful editorial term of fifteen years, drew $1,516.92 for travelling expenses for the *Review* alone," but $100 a year must seem to Dr. Bancroft, or to any other experienced literary man, a very modest proportion of the value of the service rendered. Otherwise the editor is placed in the position of paying $1,516.92 for the privilege of putting in substantial work for fifteen years. This sounds very much like the Tammany practice of roundly assessing a candidate for a judgeship for his nomination. The only chance that Dr. Bancroft seems to have for "downing somebody" is to pick out a bill for expenses of $19.50, which, according to his figuring, ought not to have been more than $18.30. Such small differences of computation are the only bases for the wild talk of "strong-arm work," "financial mismanagement," "meetings secretly called," "false explaining of the facts," and similar sweet epithets.

Who are the men who are thus brought before the bar of the Association and the public at large? Who are those whom Dr. Bancroft and his associates, by a muckraking style, by insinuation, and by direct accusation, are trying to post as common swindlers? He refers to them by innuendo, but we all know their names, for he vilifies every past or present editor of the *American Historical Review*, that is: William M. Sloane, of Columbia; John B. McMaster, of Pennsylvania; H. Morse Stephens, of California; Harry P. Judson, of Chicago; Frederick Jackson Turner, of Harvard; J. Franklin Jameson, of the Carnegie Institution; Andrew C. McLaughlin, of Chicago; George L. Burr, of Cornell; J. H. Robinson, of Columbia; Edward C. Cheyney, of Pennsylvania; Carl Becker, of Kansas.

The list also includes one other person of whom Dr. Bancroft says: "When it dawned on a certain Harvard member of the board that he was outstaying the proprieties, he withdrew and secured the election of a professor in Wisconsin University. This was considered most chivalrous. Only lately has it become known, except to a few, that the new member had already accepted a call to Harvard." I plead guilty with the greatest pleasure to having had a hand in the appointment of Professor Turner; but I absolutely deny the insinuation that it was urged in order to give Harvard a representative on the board. Harvard could exist without a member of the board. Professor Turner's appointment was due to precisely the same influence as that which brought Dr. Bancroft on the Council of the Association; namely, the reputation of being eminent scholars in American history and fair-minded men.

The similar accusations brought against members of the Council and others for receiving travelling expenses on some occasions is made up of the same unwholesome texture. The system is a proper and economical means of obtaining the attendance of councillors living at a distance; the result has been that the Association has had the advantage of the presence of members at Council meetings from Mississippi, Texas, Kansas, Wisconsin, and other Southern and Western points. I assure the American Sherlock Holmes that a chicken coop, a man's track, and an officer of the American Historical Association do not constitute legal evidence of chicken thieving, especially if no chickens have been stolen! Let us be thankful that in the midst of the array of grafters who have received travelling expenses appears not the name of the only one whose knee has never bowed to Baal, the one righteous man in Sodom!

IV.

The American Historical Association is made up of human beings who have human frailties. Dr. Bancroft is not the only one to believe that a few individuals have had large influence over their fellow-members and officers; but two attempts to stampede the annual business meeting on that issue have been failures. Part of the things demanded by the "Reformers" has long been urged by some whom they include in their rosy "Ring." Perhaps a little shaking up will be a good thing. Whatever needs to be done will doubtless be done by the Association at the next annual meeting, after the report of the Committee of Nine appointed for that purpose. The efforts to undermine the work of that committee beforehand in the minds of the members of the Association are somewhat whimsical, in view of the fact that one of the leading "insurgents" was on the committee which nominated the Committee of Nine, and made

no public objection to any name on the list.

Those who are interested in the "movement" seem to be of three types: (1) Those who think that some changes in the organization of the American Historical Association are desirable and can be accomplished without breaking the ties of ancient friendships and coöperation: in that number I wish to be recorded. (2) Those who want a personal overturning so as to get rid of particular individuals: for my part, I am entirely willing to be reformed out of office. (3) Those (let us hope, a very small number) who have adopted the manners and vocabulary of the chairman of the late Commission on Industrial Relations, and are filling the air with vague, unsubstantial, and absolutely ungrounded charges of trickery and petty thieving. I, for one, protest with all my might against this senseless mud throwing. Every man chooses his own associates; having been for thirty years intimate with many of the men so airily charged with defalcation, I stand with them.

Notes

G. P. Putnam's Sons announce the forthcoming publication of "The Bowmen and Other Legends of the War," by Arthur Machen, and "The Ballet of the Nations," by Vernon Lee.

"A Maid of '76," by Alden A. Knipe; "The Faithful," by John Masefield; "Commentary on Mark," by M. W. Jacobus; "Voting Trusts," by Harry A. Cushing, and the first volumes of Macmillan Modern Poets are published this week by the Macmillan Co.

October 9 is announced by George H. Doran Co. as the date of publication for the following volumes: "National Floodmarks" (editorials from *Collier's*); "Spragge's Canyon," by Horace Annesley Vachell; "Nobody," by Louis Joseph Vance; "Lot & Company," by Will Levington Comfort; "Buck Parvin and the Movies," by Charles E. Van Loan.

The following volumes will be published on October 9 by Houghton Mifflin Co.: "Dr. Holmes' Boston," edited by Caroline Ticknor (in a limited edition); "Aristocracy and Justice" (the ninth series of the Shelburne Essays), by Paul Elmer More; "What Shall We Read to the Children?" by Clara W. Hunt; "Two American Boys in the War Zone," by L. Worthington Green, and a new edition of "Water Babies," with illustrations by Heath Robinson. On the same date, twelve volumes of the historical works of John Fiske will be published as an addition to the Riverside Pocket Edition, and four volumes of the Vassar College Semi-Centennial series: "Brissot de Warville," by Eloise Ellery; "Elizabethan Translations from the Italian," by Mary Augusta Scott; "Social Studies in English Literature," by Laura J. Wylie, and "An Introduction to the Study of Variable Stars," by Caroline E. Furness.

"The Crown Collection of Photographs of American Maps, Series III," selected and edited by Archer Butler Hulbert, consisting of 250 photographs of American maps in the Colonial Office, London, after a long delay caused by conditions in England and the difficulty of securing materials, will be ready for delivery during the coming month. This brings the "Crown Collection" up to 750 photographs of American maps, 500 being from the British Museum.

To the number of Balkan "Princes" in this country who write and lecture on the war must now be added the noble author of "The Life of King John Sobieski" (Boston: Badger; $1.50). He is described on the title page as "Count John Sobieski," and in the publisher's press notice as "Col. John Sobieski, the dean of American lecturers." On the whole, his book is the queerest of the varied literary by-products of the war that this country has so far furnished. One or two sentences must suffice as a measure of the Colonel's military grasp and of the Dean's English: "His [the elder Sobieski's] ability certainly exceeded Marlborough of England, Frederick of Prussia, and was only equalled by Napoleon, never excelled, for he never was defeated in any great battle. . . . His country always admired, and would perhaps have loved him, if a free people were not always jealous of their liberty; perhaps, too, if he had been less fond of the Queen."

The English of "Bohemia under Hapsburg Misrule," edited by Thomas Capek (New York: F. H. Revell; $1 net), is likewise not impeccable, most of the chapters being contributed by foreign-born writers. The book is dedicated "to the cause of Bohemian-Slovak freedom" and is therefore fiercely anti-Austrian. It is, on the whole, wrong in its perspective and inaccurate in minor details, and the editor and his contributors sometimes verbosely go over the same ground. The most valuable chapter is Prof. Leo Wiener's interesting summary of Czech achievement in literature, entitled "The Bohemians and the Slavic Regeneration." It contains, however, a curious literary faux pas. Professor Wiener speaks of the famous forgery known as the "Königinhofer Handschrift" as the "Queen's Court Manuscript." This is as if a German writer were to translate "Fairfax Court House" into "Schönfax Hofhaus." Worse blemishes, elsewhere in the book, are the statements that "in Carinthia [for Carniola] there are 30,000 Germans and 500,000 Slovenes," and the puerile affectations of "Radecky" for "Radetzky" and "Rokytansky" for "Rokitansky." The German furor for Teutonizing foreign words has its analogue in the modern craze of Slavic or pro-Slavic writers for Slavicizing proper names that have, in their German spelling, become the common property of all civilized nations. The keynote of Mr. Capek's volume is perhaps to be found in the statement that "Russia, whose name is a synonym of despotism, is already in reality the most democratic country in the world." The remark is, at all events, a sample of a pro-Slavic propaganda carried on with too little discretion to be really effective.

The purpose of Henry S. Curtis's new book, "The Practical Conduct of Play" (Macmillan; $2 net), is somewhat narrower than that of his former ones upon the same general theme. The present volume is intended as a textbook for persons preparing themselves for the position of playground director, and also as a manual for any one having to do with the organization of play in less formal fashion, as a parent or a teacher. Consequently, there is a minimum of theory and a maximum of detailed information and suggestion. Theory is not excluded, however, and the result is a readable treatise—if so formidable a term may be applied to a book dealing with play—in which the detail does not appear as lifeless technique, but rather has the effect of giving great concreteness to the discussion. The author knows whereof he writes, having held, among other responsible positions, that of Secretary of the Playground Association of America. Like most of the playground enthusiasts, he is inclined to attribute overmuch to play and not enough to work, but in this volume, with its limited scope, he naturally offends less on this score than usual. Photographs add to the interest and the usefulness of the text; there is a good bibliography, and appendices offer practical directions for organizing and financing playground work.

When Dr. Felix Oswald made his journey through British East Africa in search of certain miocene deposits, he did much more than collect geological evidence. The account of his experiences, "Alone in the Sleeping-Sickness Country" (Dutton; $3 net), is chiefly distinguished by the character of the information it contains. Dr. Oswald has omitted no detail which would contribute to an authentic picture of conditions in British East Africa. He has covered a wide field without prejudice. A due amount of space is given to the economic situation, to the native negroes, their characteristics, their dances, as well as to the peculiar geological structure of their country. This generous amount of information Dr. Oswald has found sufficient in itself. He has not tried to give any literary merit to his book, and his writing is without color and without inspiration. He has presented his facts, however, in a simple, straightforward manner which is a fair substitute for style. The sleeping-sickness country is new territory for a writer, nor has literature exploited the Kavirondo negroes, a tribe which constitutes the chief interest of Dr. Oswald's book. Although they are a people in a very low stage of development, they were both courteous and hospitable to a white man who was journeying into their country on a mysterious errand. They were unable to understand the scientific purposes of his expedition, but they proved fair guides and trustworthy servants. Also, they were grateful to him for his services as a doctor. A small medicine kit was not only an introduction, but sufficient evidence in itself of good-will. An introduction to the Kavirondos was little more than a formality, for they are no longer a hostile and warlike tribe. Under British protection they have become herdsmen and primitive agriculturists. The women share the labor equally with the men, and in addition take over all responsibility for more menial services. It is their duty to grind millet, make millet-beer, and attend to all household obligations. Also, they carry water from the river. This in itself is a serious problem, since crocodiles are an important item in East African waterways. They are, in part, responsible for certain prevalent diseases among the natives, for the Kavirondo women fill their jars in shallow, stagnant streams rather than brave the dangers of the open river. This does not contribute to the general good health of the community and may account in some measure for the fact that the natives appear to be constitutionally unable to

resist disease. Entire villages have been destroyed by the sleeping-sickness. This fatal disease is the plague of the country. Not more than twelve years ago it reached East Africa through the trade-routes from West Africa, but even in so short a time the destruction that has followed in its wake is not to be estimated. As yet, no certain cure has been discovered. But it has been established that two species of tsetse fly are responsible for the plague, and a reasonable degree of precaution will secure a reasonable degree of immunity.

Dr. Oswald's descriptions of the deserted villages and ruined huts in the tsetse-stricken districts form his best chapters. They show both emotion and insight. It was close by one of these villages that he found a Kavirondo homestead, and saw for the first time evidence of affection on the part of a Kavirondo father. The owner of the homestead held his youngest son in his arms while talking with the guides of the expedition. Dr. Oswald observed this with some amazement, for kindness and tenderness have no legitimate place in a native household. Even the village dogs fall heir only to abuse. They are at best no more than tolerated, and are allowed to shift for themselves as best they may. Dr. Oswald contends that this has robbed them of all estimable canine qualities; that they have even lost the faculty of barking like respectable dogs. They howl dismally both day and night, and have bitter prejudices against strangers. Such details serve to create a vivid picture of the native character. And when Dr. Oswald journeyed further inland he collected equally valuable information on the natives of the Kisii Highlands, a people not so friendly as the Kavirondos, although more cleanly and better farmers. Their agricultural customs, however, interfered seriously with the scientific work of the expedition, for it is their habit to build great fires on the slopes of the hills, and thus clear the ground for their crops. The smoke which filled the narrow valleys did not further geological investigation. Dr. Oswald's book is a small but very valuable encyclopædia, giving a true picture of an isolated civilization which, when freed from the sleeping-sickness plague, will come to take a larger place in the affairs of the outside world.

With the publication of another volume of the "Journals of the House of Burgesses of Virginia," embracing the period 1659-60 to 1693 (edited by H. R. McIlwaine, Richmond, Virginia), the task of the State Librarian of Virginia is brought within measurable distance of completion. One more volume will conclude the series, which, with the sixteen volumes of Hening's "Statutes at Large" and the contemplated publication of the Journals of the Council, will give us a complete record of the colonial legislation of Virginia. The editor states that it was his intention to print in the present volume all the remaining Journals of the House from 1619, the date of the first General Assembly in Virginia, to the Assembly of 1695-96, with which the preceding volume begins. (We have noted in previous reviews that the publication progresses backward.) The mass of material, however, was too great, and in the present volume the work has, therefore, been carried back only to the Assembly of 1659-60, with which begins Sir William Berkeley's second term as Governor of Virginia. The same reason, pressure on space, is assigned by the editor for the omission, which we consider regrettable, of the usual section of the preface giving the "general historical setting." An appendix of five papers has been added. Four of these had been overlooked, and the fifth is printed because no Journal of the House for that session has been found. The final volume will contain the remainder of the material and, let us hope, a general index which will be indispensable to the usefulness of the series. Some of the most interesting pages in the volume before us are those relating to the troubles of Lord Culpeper, who arrived in Virginia in 1680 to take up the Governorship which had been conferred on him five years previously, over the imposition of a tobacco tax. For some years this question remained a fruitful source of contention between the House of Burgesses, on the one hand, and the Governor and the Council, on the other. Good reading is also found in the document which, in the absence of any Journal for that session, gives us all the information we have concerning the session of November-December, 1682. In this session apparently a considerable proportion of the time of the worthy burgesses was taken up with disputes between themselves and the Council as to the titles to be assumed by the clerks of the respective chambers. As his laborious task approaches an end, we must again congratulate Mr. McIlwaine on the faithfulness and care with which he has accomplished it.

The possibility of writing upon a great subject simply and yet not superficially is abundantly demonstrated by Clement C. J. Webb, in "A History of Philosophy," which is one of the most recent additions to the Home University Library (Holt; 50 cents net). Under his hand, the attempts, from Plato to William James, to explain in some measure the universe, become parts of a fascinating tale, not only intelligible, but even more or less rational, in contrast with the effect—upon the general reader, at least—of the philosophy handbook of commerce. The author knows how to make distinctions without distorting, either by exaggerating differences or by minimizing similarities. The flattering reception that the little volume has had in the country of its origin specially commends it to newer English-speaking communities. Another addition to the Library, of a related character, is Ernest Barker's "Political Thought in England, from Herbert Spencer to the Present Day." The phrase "in England" does not exclude mention of Henry George and Professor Giddings. An equal freedom is observed in the allotment of space, Graham Wallis receiving more than Bagehot. But these irregularities are merely indications of the author's unmechanical treatment of his theme. He is concerned to make his readers understand rather than to be exact in pigeon-holing; there is a glow in his discussion that not only imparts interest to it, but has decided pedagogical value. At the same time, it does not heat his criticism into passion. He is especially good in putting his finger upon inconsistencies, apparent or implicit, in political preachments, and is aided by a somewhat epigrammatic style, as when he remarks: "Carlyle is determined to go straight. In his haste to go straight, he only contrives to fall into the ditch." John Bailey's "Milton," a third addition to the Library, combines exposition with appreciation that now and then rises into vigorous defence. He is no blind partisan of his hero, whose marital and forensic extravagances he faithfully sets down, along with the literary and theological limitations, but he is occupied in the main, and, of course, rightly, with Milton's claims to immortality, rather than with his mortal weaknesses. He does not shrink from detailed analysis of the poet's similes, or even from reviewing the plot of "Paradise Regained" and "Samson Agonistes," yet this care for concrete detail and for making himself plain is not incompatible with keen discrimination between what is excellent and what is poor and what is only half-successful in the conception and the execution of the great epic. Not every one will agree with his views of the sonnet as it has been handled by various English poets—Shakespeare always and Wordsworth often "sinned as Milton did not against the true genius of the sonnet"—but his discussion of the topic is illuminating for its breadth and not injured by its independence.

In 1894, Professor Gudeman, then at the University of Pennsylvania, published an important edition of Tacitus's "Dialogus de Oratoribus." This work now appears in German from the press of Teubner (14 marks). Though the foundations are the same, the structure is greatly enlarged and improved. Professor Gudeman has built him an enduring monument, in what at once becomes a standard edition of a great work. The text is conservatively and sensibly treated on the basis of a full and accurate collation of the manuscripts and a careful and convincing study of their genealogical relations. The commentary shows a deep reading not only of Tacitus, but of the ancient authorities on rhetoric, especially Cicero, Quintilian, Seneca, and Pliny. It treats in an exhaustive way the important problems in rhetoric, philosophy, education, and history raised by the text, and includes a no less exhaustive study of Tacitus's syntax and style. In this particular, Professor Gudeman's present position with the staff of the Thesaurus Linguæ Latinæ in Munich has enabled him to use, to great advantage, material still inaccessible to the scholarly world outside. The various matters dealt with in the notes are discussed comprehensively in the introduction, which also treats of the larger literary considerations and lays once and for all the ancient doubt as to the authorship of Tacitus's treatise. The book concludes with an exhaustive bibliography and an index more concise than so important a work would deserve, were it not for the highly systematic arrangement of the introduction.

The volume entitled "University of Chicago Sermons" (The University of Chicago Press; $1.50) is noteworthy in several particulars. These sermons, eighteen in number, with an introductory essay by the editor, are all by members of the University Faculties, and may therefore be taken to represent fairly widespread opinions in the University. They are all characterized by frankness, clearness, and vigor. While distinctly religious and Christian, they attach themselves to no one of the denominational creeds. The emphasis is laid on spiritual views of life and moral character. Religion is not set over against science and art as an opposing element of life, but is regarded as a purifying and elevating influence which may belong to

all directions of human thought. The scheme of the sermons is theistic, but it is recognized that the moral power of theism may be found in systems that do not take account of a divine government of the world. Life is taken to mean the development of the total nature of man—the business of the Christian life is to fill the world with men and women fitter physically, mentally, morally, spiritually. Jesus is the most potent manifestation of this life which is lived in communion with God. Prayer is not a means of procuring from without blessings of any sort; it is primarily subjective, but may rouse the man to effort which may produce objective results. These sermons appeal to the highest human aspirations, and if they should seem to some to sin by omission, there need be no difficulty in fitting their principles into more elaborate theological systems.

Science

SUPERSTITIONS OF SCIENCE.

Kulturhistoriske Studier over Ædelstene, med særligt Henblik paa det 17 Aarhundrede. Af Axel Garboe. Kobenhavn og Kristiania: Gyldendalske Boghandel, Nordisk Forlag.

The many curious superstitions that have been current about precious stones, as well as about stones of strange form, fossils, or concretions, have been more intelligently studied of late years than ever before. For a time the apparent absurdity of these ideas deterred serious writers from taking much notice of them, and what little was written on the subject was mostly in the way of short paragraphs in ephemeral publications destined to catch the popular fancy. But with the realization of the relative importance of such singular ideas in the history of civilization, some really thorough work has recently been done. Dr. Garboe's book is one of the best special studies of its kind; indeed, within the somewhat narrow chronological limits the author has seen fit to impose upon himself, nothing approaching it in completeness and thoroughness has so far been issued. He has chosen as the subject of his work the therapeutic use of stones, their employment as remedial agents, and in order, as he says, to avoid repetition, he draws his information almost exclusively from seventeenth-century writers, whose works he has faithfully examined and from whom he gives a very large number of well-selected extracts in the original, placing them partly in the text of his book and more copiously in the footnotes.

This strict limitation as to time, while it possesses undoubted advantages and makes possible a more homogeneous exposition, has also certain disadvantages, since it necessarily leaves out of consideration, to a great extent at least, the origin of these beliefs; for the views of the seventeenth-century authors possess only a psychological interest as illustrating the thought of people who were much too uncritical to undertake any real elucidation. In a number of cases the belief that a certain particular stone would cure a certain class of ailments had been handed down through many centuries; indeed, we can safely say through thousands of years, having originated long before the philosophical theories supposed to explain it were in existence. The essential exclusion in this really valuable study of the talismanic side of the superstitions of precious stones, as well as of the specifically religious side, as in the case of the breastplate stones and the stones of the New Jerusalem, leading up to our birth-stones of to-day, is, of course, necessary to preserve the unity of the author's plan, and yet many important sidelights are cast upon the question of the remedial use of gems by their religious use, or by their dedication to saints and angels.

An instance showing the value of going back to the very earliest records is afforded by the sapphire. This stone was generally believed in the seventeenth and earlier centuries to give help in all diseases and troubles of the eye. Now, this idea was directly derived from Greek and Latin tradition as to the *sapphirus*, a name referring not to our sapphire but to lapis-lazuli, to the powder of which a certain remedial effect might perhaps be conceded. As far back as the Ebers Papyrus, or about 1600 B. C., lapis-lazuli is noted as an ingredient in eye-washes, and yet we have reason to believe that here also the real virtues of another blue mineral had been transferred to lapis-lazuli, namely, those of the oxide of copper, which was known to the ancients as *lapis Armenus*, and possessed marked astringent powers.

Dr. Garboe first deals with the views held by seventeenth-century writers touching precious stones in general, noting the fact that this term was very loosely used to designate both precious and semi-precious stones, and concretions, fossils, etc. He then proceeds to determine the ideas that induced the belief in their healing powers, touching also here and there in this connection upon their supposed talismanic qualities. Finally, he treats at length of the actual use of these bodies in medicine.

The composition of several of the more popular tinctures, quintessences, magisteria, etc., are given in the original Latin formulas, one of the most complex, comparable in this quality to the famous Electuary of Hyacinth, being that for the composition of the *pulvis rubeus Pannononicus*, concerning which we may quote from Dr. Garboe (p. 112):

Take three ounces of *bolus Armenus* mixed with rose-water and olive oil, two ounces of Lemnian earth, a half-ounce of the preparation of red coral, six drachms of prepared white coral, four drachms of each of the precious stones, emerald, ruby, sapphire, and jacinth, five drachms of prepared pearls, two drachms of choice cinnamon, one drachm of cloves, two drachms of sorrel seed, one and a half drachms of lemon peel and of white sandalwood, two drachms of red sandalwood, five drachms of prepared bone-charcoal, three drachms of ivory shavings, one drachm of Oriental crocus, four drachms of unicorn's horn, or lacking this of the *hard part* of a stag's heart, and as many as fifty leaves of the finest gold.

Naturally, the gold and gems were totally worthless, but by the clever admixture of some vegetable substances possessing a certain, if slight, medicinal virtue, the concocters of the red Pannonian powder were able to impress the credulous with the costliness of some useless ingredients, trusting that the less valuable elements in the mixture might do the work.

A rare instance of a belief that a change in the color of a pearl was a presage of death, is given on page 37, where we read that in the Danish family, Danneskjold-Samsœ, there was a tradition that when one of the pearls in a valuable family heirloom lost its beauty (or "died"), a near-approaching death in the family was portended. This is only one example among many of the interesting and new, or little known, Danish material on the subject of his book that Dr. Garboe has collected, and, as we have already stated, he has very thoroughly presented the often divergent views and observations of the seventeenth-century writers of all countries.

The much shorter work of Dr. Fühner, "Lithiotherapie," issued in 1902, to which Dr. Garboe refers in terms of measured praise, undoubtedly contains much less material than does the book under review, but attempts to give, and in many cases really does give, a somewhat wider view of the subject, in that more attention is paid to the Greek, Latin, and Oriental writers; so that, in some respects, brief as the treatise is, it can hardly be said to be superseded as yet. Still, the solid merits and great value of this new Danish contribution to the literature of this difficult and interesting subject can fairly be said to make it the best work on the supposed remedial virtues of gems and stones that has been published so far.

"The Nature and Origin of Fiords," by Prof. J. W. Gregory, of the University of Glasgow (London: Murray), is an interesting and well-illustrated volume, which has for its conclusion: "All the fiord-systems of the world owe their characteristic features to earth movements, and not to glacial action." To the present reviewer, the arguments presented to this end seem inadequate. They are too often based on erroneous interpretation of observations, as when the spurs on the west side of the Gulf of Cattaro, on the Adriatic, are described as due to faulting. They are too often supported by favorable conclusions quoted from various writers, instead of by an analysis of the reasons that led to such conclusions. The book furthermore appears to be tainted with special pleading, inasmuch as it gives greater emphasis and acceptance to arguments and opinions against than for glacial erosion. In view of these defects, it is to be feared that the book will, from its apparent frankness and from its evident erudition, mislead readers who accept its guidance.

Drama and Music

"HUSBAND AND WIFE."

Audiences will have happy endings and the playwrights have yielded. Since the first performance of "The Big Drum" Sir A. W. Pinero has been forced to bring the lovers together before the final curtain, but it has remained for the author of "Husband and Wife" (Forty-eighth Street Theatre) to devise an ending which is both happy and piquant. It is, in fact, a double ending, the first or legitimate ending being to satisfy his artistic conscience, and the second serving to give happiness to the audience. After we have been told that there is hope, although faint hope, that the defaulting hero will not be prosecuted, a Japanese butler suddenly appears, while the protagonists are in each others' arms, to report as follows: "Mr. Knight [the bank examiner] says that everything is O. K." The announcement was met by titters on the part of the audience, which were not unmixed with the satisfaction of knowing definitely that husband and wife were not to be separated.

Apart from this novel feature, the play is not noteworthy. It treats the theme, signalized by Ibsen's "Doll's House," of misunderstandings arising between a husband and wife who have no intellectual companionship, since the man prefers that she remain a pretty doll. She, from pique and rebelliousness, gives herself up to frivolity, and by her extravagance involves her husband in debt which he vainly tries to meet by speculation with money not belonging to him. The play has not Ibsen's skilful construction, and appears, indeed, to be machine-made. But the performance of the principal actors was not unworthy of the serious subject. Mr. Robert Edeson, though not entirely free from the theatrical, gave a competent representation of the defaulting cashier, and Miss Olive Tell by her prettiness and charm helped to dignify a part which might easily have become melodramatic. F.

"MOLOCH."

The European conflict has furnished a new setting for those old combatants of the stage, Virtue and Vice, and has endowed them with the new names Peace and War. Miss Beulah M. Dix, the author of "Moloch," has indeed gone so far as to reinvest them with their original abstract quality. For her evident intention to be neutral has resulted in a clash of right and wrong, not in individuals, nor even in nations, but in the scheme of the universe. The play merely pictures two nations in arms against another, all three being unnamed; no motives are assigned, and that the victory of the allies is not meant to be righteous is indicated by the fact that, as soon as they get the common foe off their hands, they begin to fight each other. We have no quarrel with any one who attempts to make war a series of unmitigated horrors, but are bound to admit that this procedure destroys dramatic interest and turns a play into a spectacle. Even in the old morality plays vice took on human form, and there was a chance to hiss in the only way in which hissing is satisfactory; namely, at one's fellow-man.

Now, war as villain does not meet dramatic requirements. It is so huge that it inspires merely the dread which is felt for a gigantic convulsion of nature, or for so degenerate a natural tendency as is embedded in the preachment of Brieux's "Damaged Goods." The dramatic interest of "Moloch" scarcely exceeds that of the motion-picture play "The Battle Cry of Peace," which latter is a tract in behalf of preparedness.

Having said so much, it is only fair for us to add that the representation given by Holbrook Blinn and his company at the New Amsterdam is in most respects admirable. The main defect is an inarticulateness on the part of certain actors. The fault is one to which audiences should strongly object, as it seems to be growing, in English as well as in American actors. To realize how far stage speech has in recent years deteriorated, one has only to notice by contrast the resonant, distinct voice of that well-trained actress of an earlier school, Mrs. Thomas Whiffen, who gives an excellent performance as the mother. Mr. Blinn, by the fire of his acting as colonel, does much to counterbalance the impersonal element of the play to which we have referred. The scene on the firing line was almost too vivid for some members of the audience, whose ears and nostrils rebelled at the terrific booming and the resultant smoke. F.

A MELODRAMA FROM DRURY LANE.

"Stolen Orders," the "thriller" which seems likely to keep the large Manhattan Opera House reasonably full for a considerable time to come, belongs to the ante-bellum days of Drury Lane, to be precise, to the year 1913, which means that some of its incidents seem as of a period incalculably distant. It is, for instance, with a distinct sense of shock that one sees a German admiral welcomed, at all events with the appearance of perfect courtesy, aboard a British battleship, while the ship's band breaks into the strains of "Die Wacht am Rhein." Inevitably one almost waits for the discharge of a torpedo from the coat-tail pockets of this bearded, von Tirpitz-appearing officer. This particular thrill is denied us, since, incredible as it now seems, in the year 1913 relations of amity existed among the great Powers of Europe. Nevertheless, as the authors would have us believe —and we may accept their word—in the land of England harbingers of the strife to come were abroad in the persons of secret agents of "a certain great Power," and one of the two threads of plot that hold together this melodrama concerns the theft of an envelope containing sealed orders from the cabin of a British admiral. The other thread, which is brought into rather forcible connection with the former, relates to a burglary (staged in the first act) which took place twenty years before the main action of the piece begins. For the rest the plot progresses in orderly fashion through the tried and accepted stages of Drury Lane melodrama to its appointed conclusion when innocence is vindicated, virtue rewarded, and vice punished, quite as things should be in self-respecting melodrama.

To recount all of the various thrills by means of which the action advances would be both tedious and superfluous. It is sufficient to note that they include a dive from the main topgallant, or some equally inaccessible spot, of a battleship, and the shooting of a Zeppelin in mid-air. The large cast (nearly fifty names figure on the programme) is, on the whole, well selected, and the piece is played with spirit. It is pleasant to greet again Miss Connie Ediss, who is always amusing, in the rôle of a beauty specialist, and that capable actor of the old tradition, W. L. Abingdon, who, as Baron Kurdmann, well sustains the enviably villanous reputation that he won in similar parts at Drury Lane a quarter of a century ago. The production of the piece is acceptable, if not so impressive as it might have been, and the stage management is excellent. Altogether, "Stolen Orders" is worthy of the reputation of the famous house from which it comes. S. W.

"TWO IS COMPANY."

This "Parisian musical novelty" at the Lyric Theatre is an American version of "Mon Ami Emile," by Paul Hervé. The music is by Paul Briquet and Adolf Philipp. The plot is quite visible. It is set in motion by the vanity of a mother-in-law (invisible), who presents her daughter, Heloise, Baroness d'Heurville, with an oil painting of herself of twenty years ago. At that remote period she bore a remarkable resemblance to the Heloise of to-day. In a conversation, which caused us much anxiety lest a slip clear up the misunderstanding, the Baron freely gives the very gentlemanly Emile permission to make love to the original of the portrait. Emile hastens to tell Heloise, who does not return his deep affection, the news that her husband welcomes his attention to her. She is enraged and engages a detective to secure evidence for divorce. The Baron does likewise, and the two detectives, Dubois and Dupré, specialists in the breaking up of homes, partners but enemies, are opposed to each other in the d'Heurville case. These two supply the humor of the piece, and their professional labors move the characters about. By the end of the third act the d'Heurville family is reunited and Emile is rewarded with an attractive partner in Lu Lu, the actress, whose packet of old letters from the Baron we see many times during the evening. This tale is most discreetly told in a series of pretty scenes. There are good singing by both chorus and principals, pleasing but not ravishing music, which lacks variety and in which the waltz is over-prominent, and a scattering of harmless jokes. The leading actors, who proved that two is company, were equal to the problem. Georgia Caine was a real Baroness, and one with an excellent taste in dress. May de Sousa made entirely credible her statement that both bachelors and married men pursued her. D. B.

THE CENTURY AS A MUSIC HALL.

Only time can decide whether the present experiment of Mr. Fred Wayburn shall represent the final destiny of the unwieldy building that a few years ago started life with high hopes as a Palace of Art. Art, at least the art of the modern drama, does not thrive in a palace of these dimensions, and the house is certainly better adapted to its present use as a music hall than it ever was to the well-intentioned enterprise of Mr. Winthrop Ames. There will be few tears for the things of the past. Whether, on the other hand, there will be laughter enough or originality enough to insure the success of the house in its new adventure is open to question. The management boldly challenges comparison by advertising the re-made Century as "the only Continental music hall in America," and offers as the first attraction a review of much variety and considerable length with the appropriately all-embracing

title of "Town Topics," the title serving as the only link between successive scenes. Unreserved praise must be given to the staging, dressing, and management of the production. The costumes are elaborate and the color-schemes well conceived; the frequent changes of scenes are made with speed and precision; Mr. Wayburn utilizes the revolving stage of the Century as it has never been utilized before, and the beautiful spectacles of the four seasons are alone well worth seeing. Mention must also be made of the excellent dancing of Adelaide and Hughes, which is in the legitimate manner of the ballet. None of the externals which should go to the making of a successful review of the Continental type are lacking. These things, however, contribute to but do not make a review. The humor of Bert Leslie and of Miss Trixie Friganza is bludgeon-like in its incidence; the most genuinely humorous thing in the production is the patter of Will Rogers. "Town Topics" may be, and very likely is, exactly the sort of thing that New York wants, but it is not even a good imitation of the typical entertainment of the best Continental music halls. S. W.

In "The Sorrows of Belgium," a play in six scenes (Macmillan; $1.25), the Russian writer, Leonid Andreyev, professes to delineate the tragedy of Belgium as reflected in the home of a famous Belgian poet and thinker, Emile Grelieu, standing as the representative of the national conscience. There is nothing dramatic about the piece. Virtually nothing is done upon the stage, but the confusion, horror, despair, and desolation consequent upon the influx of the barbaric German host are described in conversation by members of the Grelieu family and others. It is possible that these descriptions are more vivid and impressive in the original than they are in this "authorized translation" by Herman Bernstein, which has no distinction. They show imagination, but not of any uncommon order. Had they been written originally in English, it is extremely doubtful whether they would have been deemed worthy of reproduction in a foreign tongue. Certainly they reveal no especial power of insight or invention, although they represent, with considerable fidelity, the bewilderment arising from the shock of an unforeseen calamity. Pathetic and patriotic passages abound, but they are of ordinary quality. The conversational narrative relates how the peace-loving sage, Grelieu, accompanied his sons to the war, how he was wounded, how he was visited privately by the King, and how he advised the latter to break the dikes and loose the raging waters upon the ruthless invaders. There is a scene at German Headquarters, when the advancing floods are reported, but that is utterly ineffectual. Finally the curtain falls upon the poet-patriot as he prophesies the restoration of free Belgium to more than her former beauty and prosperity—a prophecy for whose fulfilment every one will hope. The play conveys the impression of having been written in a great hurry, under the impulse of strong and righteous indignation, but it is not illumined by dramatic or poetic fire.

Three volumes in Richard G. Badger's Contemporary Dramatists' series are at hand (75 cents net, each). These are José Echegaray's "The Great Galeoto," translated from the Spanish by Jacob S. Fassett, jr.; "Advent," by August Strindberg, translated from the German by Claude Field, and Maxim Gorki's "Nachtasyl." This last is a new version under the title "Submerged," translated from the Russian by Edwin Hopkins.

Apart from Stephen Foster, whose simple yet inspired melodies have become American folksongs, the most American of all composers is Edward MacDowell. He is as American as Mark Twain or Bret Harte, and that is why Europeans like his music, as something "different." Massenet was the first to commend this music to the French. In Germany it is printed by the leading publishers, and has a large sale. But it is in Great Britain that it has most particularly come into vogue, partly, no doubt, because with all its American coloring, it is tinged here and there with Scotch and Celtic elements.

Not only are articles on MacDowell's music appearing in English periodicals with increasing frequency, but two new books on him are in course of preparation. One of them is by Ashton Jonson. It will be a handbook, like his invaluable volume on Chopin, containing not only his own comments on all the important MacDowell compositions, but those of others who have written on them. This will be an invaluable book to amateurs as well as to the large number of professionals who now regularly include MacDowell's songs or piano pieces in their programmes.

The other new book on MacDowell is being written by Templeton Strong, who was for years his most intimate friend. It is appearing in instalments in that excellent English magazine, the *Music Student*. There is a special summer issue of this magazine devoted almost entirely to MacDowell and his works. Apart from Templeton Strong's "Reminiscences," there are articles on the MacDowell songs written by E. S. Mitchell; the choral works, by R. Runciman Terry; the orchestral works, and "MacDowell as a Poet," by Ashton Jonson; "MacDowell as a Teacher," by Mrs. MacDowell, an interesting interview with whom is also included. The editor of the *Music Student*, Percy H. Scholes, contributes a valuable article on the piano works, with frank yet highly appreciative notes on the sonatas and groups of short pieces. The editor confesses that in going through these works again he has been more and more impressed by the fact that he had "previously rated MacDowell too low." There are also pages on his part-songs, his orchestral works, the Peterborough colony, his tragic last days, together with some pages of anecdotes illustrating his character. Organists will be interested in the article by Dr. Bairstow on transcriptions for their instrument of MacDowell pieces. Violinists will be interested in the information regarding Arthur Hartmann's translations for the violin of five of the MacDowell gems. One of these, "To a Wild Rose," promptly had such a large sale that the composer's royalties alone amounted to five thousand dollars.

Josef Stransky has obtained the right to the American première of Richard Strauss's new tone-poem, the Alpine Symphony, and it will probably be one of the novelties of the New York Philharmonic's coming season. The publishers of this important novelty have already issued a miniature score, a version for piano, and an explanatory pamphlet. The work lasts about forty minutes and, according to Lenckhart, its publisher, "the whole structure is, for Strauss, unusually clear, so that the hearer can easily follow the twenty-two divisions of the work."

Art

CHURCH ART IN ENGLAND.

Pulpits, Lecterns, and Organs in English Churches. By J. Charles Cox. New York: Oxford University Press.

This latest volume in the notable series of books upon Church Art in England, under the distinguished editorship of Mr. Francis Bond, will appeal to those who are concerned with the "Church" rather than with the "Art" mentioned in the title. The attempt at a complete registration and dating of English pulpits, lecterns, organ cases, and ecclesiastical hour-glasses, during the mediæval and "Post-Reformation" periods, will, of course, prove valuable to the student of art. The author's long and diligent travel and research have resulted in important additions to the enumerations of such earlier works as Dollman's "Examples of Ancient Pulpits," published in 1849. The wealth of superb illustrations, often of remote and undeservedly obscure monuments, are an asset that the reader has been taught to expect in this series. Attracted by such virtues as these, the critic is disappointed at finding no adequate classifications within the different periods, no account of the general evolution, and no analysis of the several styles. The major part of the volume is occupied by the treatment of true pulpits, *i. e.*, pulpits for preaching in distinction from ambos for Epistle and Gospel, which received no large, monumental expression in the English church, but took the modest form of small reading-desks, often in the shape of the later lectern, an eagle with outspread wings. For these pulpits, it surely is not enough to distinguish two great mediæval groups according to the materials of stone or wood, to bring together all the Elizabethan, Jacobean, and Carolean examples, and to base the arrangement upon counties. Dr. Cox might have made his book more final if he had sought to discern stylistic subdivisions within these groups or indulged himself in less vague, casual, and meagre discussions of technique and design. One would have appreciated, for instance, a comparison of the few figured pulpits with contemporary sculpture, an effort to discover the reason for their obvious inferiority, or a comparison of the ornamental details with contemporary screens and architectural decoration. The author also fails to utilize the light that might have been thrown upon the English development by more frequent reference to Continental specimens.

The ecclesiologist, however, will find much to interest him, though it is scattered rather loosely through the pages and sometimes appears in the form of digressions, not indispensable to the reader whose purpose is purely artistic. Characteristic instances are the long rehearsal of the diverse uses of the pulpit at the end of the first chapter and the passage about clerical education in the sixteenth century in the chapter upon Post-

Reformation Preaching. The author has sought to enliven the many sections that tend to the dryness of a mere catalogue by interspersing them with anecdotes about particular monuments, occasionally drawn from his own experience as a sermonizer. The most significant point made in the book is the convincing demonstration of the fact that, contrary to the usual opinion, preaching in the vernacular was common in the Middle Ages and decreased rather than increased at the beginning of the Reformation. In the fourteenth, and especially the fifteenth, centuries the imposing pulpit was therefore a conspicuous article of ecclesiastical furniture; examples from the earlier Middle Ages are not extant, because hitherto light, portable structures of wood had been employed.

Dr. Cox writes with an Anglican priest's pleasant enthusiasm and affection for the objects that he describes. He sounds the note of a much-needed warning when he denounces English neglect of existing monuments and such religious and artistic desecration as the transmutation of the pulpit at Marholm into a sideboard for the dining-room of the rectory!

Finance

AN INTERESTING ANNIVERSARY.

One year ago this week, officers of the banks in all quarters of the United States were in conference, precisely as they are to-day. The conference of last September, like that which is now in progress, had to do with the raising of a great credit fund—the amount named a year ago was $100,000,000. This fund, like the pending Anglo-French credit, was to be utilized for the purpose of correcting an abnormally violent derangement in exchange between New York and London. It was to be administered, as the proceeds of the European loan will doubtless be, by a committee of bankers whose function it was to release the credits established, in proportion as they were needed, to regulate exchange rates.

But with these parallel conditions, the resemblance between the operation of last September and the pending operation ceases, and is replaced by contrasts. The American bank syndicate of a year ago was called upon to deal with a state of things in which the New York market's position was exactly what the London market's position is to-day. Sterling exchange stood at $4.97¾, whereas the normal maximum rate in London's favor would be $4.89½. The rate had been $6.50. At the rate ruling a year ago this week, it was possible to say that the American dollar was theoretically depreciated 2⅜ per cent. on the English market. New York was in fact exporting gold at the rate of $5,000,000 weekly, sending it to Ottawa for the account of the Bank of England. This gold was going out in spite of a deficit of $31,000,000 in New York bank reserves, and an 8 per cent. rate for both short and long term loans; yet it had not restored foreign exchange to anything approaching a normal level.

It is scarcely necessary to indicate the points of dramatic contrast in the existing situation. The single point of resemblance left is the reappearance of the American banks, engaged in making arrangements for a syndicate to relieve the situation. But the question, over which future financial history is likely to be somewhat puzzled, is the reason why the two periods—last autumn and this—should have presented such diametrically opposite fundamental conditions. If our market's position is now so supremely strong, especially in relation to London, why did it show such weakness a year ago? The fact that the huge contracts for war munitions had not then been thought of, answers the conundrum partly, but not wholly; because the existing conditions in the market for exchange arose before exports of war munitions had begun in quantity. Our enormous exports of grain, for example, were as much of a certainty, last September and October, as they were six months later.

The real answer probably is that twelve months ago the whole financial world was mistaken about the economic situation. Both Lombard Street and Wall Street then imagined that London would continuously call in all of Great Britain's outstanding foreign credits, and, in particular, would realize at the first opportunity on the whole mass of England's holdings of American securities. Each market thought that, even if New York were to gain the place of financial centre of the world (which was then not considered probable), the event would relieve, not aggravate, London's burden of payments on the international markets. What both financial communities overlooked was the enormous influence of the unseen movement of the world's free capital to the market which had shown its qualities as a safe depository.

This is a situation big with sensational economic possibilities if the war is long continued; and it is so, irrespective of the question, whether or not the Anglo-French loan negotiations result in the partial readjustment of the market for international exchange. While setting forth last week the reasons for such a loan to England and France, to readjust the greatly disturbed balance of international exchange, Mr. James J. Hill stated as a "reasonable prediction" that the country's excess of exports over imports for the calendar year 1915 would be $2,500,000,000. What this would mean may be judged from the fact that the largest export surplus for any previous calendar year was the $692,000,000 of 1913, and that the average for the ten past calendar years was only $478,000,000. This being so, Mr. Hill's supposition seemed inconceivable.

Last week's Government statement of our foreign trade in August, and for the year to date, showed that during the first eight months of 1915, excess of exports had crossed the billion-dollar mark. The exact figure of the surplus, $1,081,000,000, not only ran more than a thousand million dollars beyond the same months in 1914, and $689,000,000 beyond the highest previous record for the period, but actually surpassed by $885,000,000 the average eight months' export excess in the ten preceding years. The results for August alone — usually the slackest export month in any years—were that the largest previous export surplus, that of 1913, was overtopped by nearly $70,000,000. And the "munitions shipments" were only beginning to move in quantity.

Does the year 1915 as a whole, then, bid fair to show any such amazing results as Mr. Hill suggests? That depends on two uncertain questions—how great the monthly outgo of war material will be, and to what extent our shipment of agricultural and miscellaneous products will maintain the volume of the previous months of war-time. For the four months still remaining to be reported on, the largest total export excess in the past was the $351,000,000 of 1912. Supposing a monthly increase of $100,000,000 this year—which is not unreasonable, unless our general exports decrease abnormally—the export surplus for the present calendar year would be something like $1,800,000,000, or nearly a billion and a quarter above the best previous record.

This is still well below the estimate of Mr. Hill. Yet nobody knows to what figures the "munitions exports" may not go, if there are ships enough to carry them.

LARSON'S HISTORY OF ENGLAND

By LAURENCE M. LARSON, University of Illinois. (*American Historical Series.*) xviii+661 pp. 12mo. $1.40.

This textbook provides about the right amount of material for a high school or short college course. The author has attempted especially to do two things: to make clear the connection of English history with related events and movements on the Continent and to give an adequate account of those developments in the history of Britain that have a peculiar significance for the history of our own country. Several pages are given to the events leading up to the Great War of 1914 and to its development in its early stages.

Henry Holt and Co. 34 W. 33d St., NEW YORK

Germany's Violations of the Laws of War

12°. $1.25.

A report prepared under the direction of the Ministry for Foreign Affairs, and based chiefly upon the original German documents. It contains nothing that is irrelevant or of doubtful authenticity. It presents irrefutable documentary evidence that exposes in all its ruthless inhumanity the system of calculated terrorism by which Germany hopes to hack its way through to the domination of Europe.

LEWIS'S ELEMENTARY LATIN DICTIONARY

With Appendix. $2.00

By **CHARLTON T. LEWIS**, Ph.D., author of "A Latin Dictionary for Schools," and editor of "Harper's Latin Dictionary." With an Appendix of Names of Persons and Places compiled by **Hugh Macmaster Kingery**, Ph.D., Professor of the Latin Language and Literature, Wabash College.

In the new edition the usefulness of this popular small dictionary has been considerably increased by the addition of an Appendix of seventy-seven pages containing the names of persons and places met in the Latin authors commonly studied in the first two years of the college course. While there is some diversity of usage among the colleges in regard to the Latin authors read during the freshman and sophomore years, the range covered by the Appendix is believed to be sufficiently wide for all needs.

EXERCISES IN FRENCH COMPOSITION

By MARY STONE BRUCE
Formerly Head of the French Department in the Newton High School, Newtonville, Mass.

12mo, cloth, 91 pp., illustrated, 35 cts.

This book provides, for second-year work, exercises based on Alphonse Daudet's "La Dernière Classe" and "La Siège de Berlin." The text of the two stories is given complete, a historical sketch in French setting forth the important details of the Franco-Prussian War, and a map.

The stories are full of interest and an abundance of material for composition drill has been included to give the student a thorough grounding in the technique of composition.

NEW YORK, THURSDAY, OCTOBER 7, 1915.

Summary of the News

Negotiations between Secretary Lansing and Count Bernstorff have resulted in what appears to be a complete and satisfactory settlement of the controversy regarding the sinking of the Arabic and probably of the entire question of the German submarine warfare. At a meeting in New York on Saturday, the Ambassador handed to Mr. Lansing a note setting forth the changed attitude of the German Government. This, it is understood, was not completely satisfactory in certain particulars, and the terms were subsequently modified, with the result that late on Tuesday, following another conference in Washington, Secretary Lansing gave out for publication the text of a letter received from Count Bernstorff. On behalf of his Government, the Ambassador accepts the affidavits of British officers that the Arabic had no intention of ramming the submarine, tenders the regrets of the Imperial Government, and expressly disavows the act. He also states the willingness of his Government to pay an indemnity for the lives of American citizens who were lost.

Interest in the Balkans during the past week has eclipsed even that in the results of the offensive of the Allies in the west. That Bulgaria has definitely determined to enter the conflict on the side of the Central Powers is now universally admitted, except by M. Radoslavoff, who continues to insist on the transparent fiction of "armed neutrality." An ultimatum was presented by Russia on Monday, which expired at 4 P. M. (Sofia time) on Tuesday, demanding the instant dismissal from Sofia of German and Austrian officers—who, as Sir Edward Grey announced in the House of Commons on October 1, have been arriving to take charge of the military preparations of Bulgaria—and a definite break with the enemies of the Allied Powers. At the time of writing no reply to the ultimatum has been sent.

Meanwhile Greek mobilization was ratified and a war loan of $30,000,000 authorized by the Greek Chamber of Deputies on September 30, M. Venizelos being on that occasion unreservedly supported by former Premier Gounaris. A French force, numbering, according to some correspondents, 70,000 men, has been landed at Salonica for the support of Servia and Greece. A protest, which was purely formal, was made by Greece against the landing, but all facilities for it were given by the Greek Government. Premier Venizelos explained the circumstances in the Chamber of Deputies on Monday. The session, which lasted till 4:30 o'clock on Tuesday morning, was a stormy one. The Premier urged the fulfilment of the treaty with Servia in "letter and spirit" and the Chamber finally passed a vote of confidence in the Government by 142 to 102, thirteen members not voting. In spite of the attitude of the Chamber, however, according to a dispatch from Athens to the Havas agency yesterday, the Germanophile King Constantine has refused to support the policy of his Ministry and Premier Venizelos, perhaps following the example of Signor Salandra when Italy was on the eve of war, has resigned.

The joint proposals recently submitted to Bulgaria for the cession of Servian territory in Macedonia have been withdrawn, and dispatches in Tuesday's papers recorded the evacuation by Turkish troops of fortresses along the Bulgarian border. The Rumanian Premier, M. Bratiano, according to dispatches from Bucharest on Tuesday, has reiterated his determination to maintain the neutrality of his country. In Bulgaria itself it is considered probable that the prospect of war on the side of Austria and against Russia will be viewed with considerable dissatisfaction by a large section of the population.

The State Department made public on October 1 a long note from Sir Edward Grey replying to charges that the British blockade was operated to prevent American exports to neutral countries while British exports to the same countries had greatly increased in volume. The note freely quotes figures in disproof of the charge and takes especial exception to certain statements in this connection published by Robert P. Skinner, American Consul-General in London. Dispatches from Washington of Monday's date announced that Mr. Skinner had been summoned to Washington for consultation with the State Department in regard to the trade situation existing between the United States and Great Britain.

Subscriptions to the underwriting of the $500,000,000 Anglo-French loan were closed on Tuesday morning. According to reports available as we write the loan has been a complete success and has been considerably over-subscribed, despite the opposition of economists of the type of Mr. Bryan, Mr. Ford, and Mr. Bernard H. Ridder, of "The American Truth Society." The precise terms of the loan were published in the papers of September 29.

Elsewhere we speak of the Armenian atrocities. Count Bernstorff, following his blanket denial, which we recorded last week, sent a communication to the State Department saying that the reports of atrocities were "much exaggerated." If so, the exaggeration is acquiesced in by the American Committee on Armenian Atrocities, a detailed report of whose investigations was published on Monday. On September 30 it was announced that the State Department had placed an informal request before Count Bernstorff asking that he use his influence with the German Government to intervene on behalf of the Armenians in Turkey.

Evidence multiplies of the utter breakdown of the German submarine campaign. Mr. Balfour, First Lord of the Admiralty, in the House of Commons on September 30 declined to make public any statistics showing the number of German submarines that had been captured or destroyed on the ground that no figures could be given with sufficient certainty to warrant their official publication. It becomes increasingly evident, however, that the measures developed by the British Admiralty for defence against submarines have proved successful. This view was confirmed by dispatches from Washington published in the morning papers of last Saturday as well as by an article by Capt. Persius in the *Berliner Tageblatt* of September 9, evidently preparing the German public for an admission of the failure of the submarine campaign. Since we wrote last week only three vessels, two Norwegian steamers and one British sailing-ship, have been reported destroyed by submarines.

The State Department on October 1 gave out a descriptive list of the sixteen documents forwarded by Ambassador Page from London, which had been taken by the British authorities from James F. J. Archibald, the unofficial messenger of Dr. Dumba. The latter received orders for his recall and a safe conduct through the British zone last week and sailed from New York on Tuesday.

Another diplomatic officer to be disciplined is T. St. John Gaffney, American Consul at Munich, who has achieved notoriety on account of his ventilation of anti-British views. Mr. Gaffney's resignation was requested by the State Department last week. In Sunday's papers was published the recalled Consul's own explanation of his activities.

Not unconnected, one may assume, with the disastrous result of Dr. Dumba's activities on behalf of his down-trodden countrymen was the letter, published in Sunday's papers, addressed by Sir Cecil Spring Rice, the British Ambassador, to British Consuls throughout the United States, warning them as to the limitations of their privileges as diplomatic representatives in a neutral country.

The Belgian Minister last week presented a memorandum to the State Department dealing with allegations that the Germans have violated the Hague conventions in forcing Belgians to perform work for the German army.

A severe hurricane swept over New Orleans and the Mississippi Gulf coast on September 29. According to recent reports the loss of life was approximately 300 and of property $12,000,000.

The reopening of the Panama Canal, which it had been expected would take place on Tuesday, has been postponed on account of further slides. Lieut.-Col. Harding, it was announced on Monday, has recommended to the Secretary of War the closing of the Canal until November 1.

We have to record two remarkable achievements in experimentation with the wireless telephone which occurred last week. On September 29 Secretary Daniels announced the successful transmission of wireless telephone messages from the United States Naval Radio station at Arlington to the Naval Radio station at Mare Island, Cal., a distance of some 2,500 miles. On the following day the American Telephone & Telegraph Company announced that a telephone message had been transmitted from Washington to Pearl Harbor, Hawaii, a distance of 4,600 miles.

The Week

The comments of leading German newspapers on the Allied offensive make curious reading. Their favorite theme is the contrast between what the French and British are achieving on the western front and what was accomplished by the Germans and Austrians in their tremendous sweep through Galicia and Poland. That the contrast exists, there is, of course, no question; but that it is an occasion for the particular kind of vainglorious boasting in which these German journalists indulge is something which the non-Teutonic mind must find it hard to grasp. Everybody gave Hindenburg and Mackensen and the Germans generally credit for a magnificent military achievement in their eastern campaign, in spite of the obvious and enormous disadvantages under which their enemy labored; but when they profess to believe that Gen. Joffre and Gen. French had looked forward to making as clean and swift a job of driving the Germans out of their intrenchments in France, they are talking what in the homely speech of the blödsinnige Yankees is denominated as buncombe. These writers make much of the fact that the attack had been many months preparing, but they apparently regard the circumstance that the defence had been a whole year preparing, with munitions, defensive apparatus, equipment, and organization on a scale unapproached in the world's history, as a point of too trivial importance to take into account. What the German people themselves think of the situation it is of course impossible to tell; but it is quite certain that the terrible toll of lives, piled on what has gone before, will, if unaccompanied by anything more satisfactory to reflect upon than these hollow comparisons, set multitudes of Germans to thinking harder than ever of the wisdom of "fighting to the last man."

The Kaiser shedding tears over France, decadent and doomed because guilty of atrocities in war, ought to be commemorated in art. A German sculptor could make a touching statue of him in that attitude, the Imperial tears being rendered as realistic as Bismarck's spurs. The affecting monument should be set up in Liège, or before the portals—if they could be found—of the University of Louvain. Or the successor of Wildenbruch might write an historical drama bringing in the Emperor mourning over the decay of chivalry in France. Burke's famous lament could be worked in, and extracts piously made from the "pure French" in which Wilhelm told the correspondent of his sadness because the France of which he had cherished hopes so high had fallen like Lucifer. And then either drama or statue would be to posterity a standing refutation of the charge that the Hohenzollerns were destitute of humor.

The rise and fall of the submarine is the history of almost precisely a twelvemonth. On September 22, 1914, a German U boat sank the British cruisers Aboukir, Cressy, and Hogue in the North Sea, and the British Empire was tottering. On October 2, 1915, a dispatch from Washington, which found its way to the front page of a great many papers, announced that the British Empire was saved because the submarine peril was "ended." We shall not be far out of the way if we detect in this widely circulated dispatch from Washington the inspiration of the big-ship people as against the mosquito-fleet people, now that discussion of naval defence is drawing to a head in Administration circles. A year ago the undersea boat had scrapped the Dreadnought. To-day the big ship and the destroyer have scrapped the submarine. Such dramatic fluctuations impress the public mind. From the unseen terror of the seas, the U boat is by way of becoming the joke of the seas, a frail cockleshell that may be caught in nets, that may be "bombed" from aeroplanes, that may be put out of business by a couple of men in a swift motor-boat with a gun. But when you have read the whole story, the first impression that a sovereign remedy against the submarine had been discovered rather thins out. You read that the British fleet has tamed the submarine by means of submarine telephones which herald its approach, by establishing destroyer patrols, by spreading nets along the most frequented channels of traffic, by planting special mines, by using fleets of swift motor-boats, by spying from aeroplanes, by keeping thousands of trawlers on perpetual guard. In other words, if the submarine peril has been ended, it is apparently through the most strenuous efforts of every conceivable kind.

The truth is, of course, that amateur discussion on the subject has overlooked the vastly different conditions which obtain in the war in the North Sea, and those that would be met if we were at war. In the first place, the submarine has been tied up with the question of national defence, whereas Europe's experience has shown that the submarine is primarily a weapon of offence. Germany has not been saved from invasion by her submarines, but by her coast defences. Great Britain's submarines are the only weapon precisely which has not been employed to end the submarine peril of the enemy. As a weapon of offence, the submarine must mean one thing against England, with her narrow waters marking out the routes along which the food supply vital to her national life must come in, and another thing to the United States, with our immense coast line and our virtual independence of foreign sources of supppiy. England's solution of the submarine peril, therefore, means very little to us, since the submarine could hardly be used against us. But if it is the weapon that we are to use against the foreign invader, it is evident that its limitations must be carefully studied. Against a fleet blockading our coasts the submarine would be useful.

Military events in the west and the crisis in the Balkans have diverted attention from the Russian battlefields, so that an event upon which observers have been speculating for months has come to pass with little notice. We refer, of course, to the end of the Russian retreat, the end of the greatest sustained operation of the war. The Teutonic drive which began in Galicia on May first has run nearly as long as the entire course of the Franco-German War of 1870-71, if we count from the first German victories near the Rhine to the capitulation of Paris. For months, as one Russian line of defence after another gave way, the world was asking where the Czar's armies would make their stand. The expectation was of a sudden turning by the pursued armies and a great battle in which the Germans, if not defeated, would yet be brought to a halt. But the end has come in less abrupt and dramatic fashion. Gradually the onset of the Germans has been spending itself. Gradually the Russian armies gathered breath and strength, until to-day a balance of forces has been struck, and we seem on the eve of the long-awaited development, German intrenchment and deadlock. At only one point in the line is there a possibility of a further movement. Von Hindenburg may yet take Dvinsk, possibly Riga. But even such a development would not mean the continuance of the great pursuit. The other sections of the front are too far removed to be directly affected by the outcome in the north. The battle line to-day is where it was two weeks ago, according to the semi-official description of September 23 from Petrograd.

From the Gulf of Riga it runs parallel to the Dvina, crosses the Vilna-Petrograd railway to the south of Dvinsk, stretches along the chain of lakes and streams south of that city, passes west of the Baranovitch railway junction, east of Novogrudok, just east of Pinsk, and then along the Styr River to Tarnopol in Galicia. This is the probable line along which the winter campaign will settle down.

For the $500,000,000 loan to the French and English Governments — running five years, bearing 5 per cent. interest, sold to the underwriters at 96 and to the investing public at 98, payable in American gold values, and offered in denominations as low as $100—the American bankers have closed an underwriting contract. The loan now faces the secondary stage of distribution to American investors. From every point of view, it is a remarkable undertaking. Until this year, no loan of any European Government was ever offered for popular subscription in this country. Our banks bought $208,000,000 of the British Government's 2¾ per cent. Boer War loans of 1900 and 1901, but sold them back to London later, without offering them to the American public. In 1904 and 1905 $130,000,000 Japanese war loans were taken by our investing public, and many of those bonds are still owned here. But that was not a European loan; not until this present year were even short-term bonds of such states as France and Switzerland bought by our investors. Nor are these the only unusual facts about the pending loan. Its total amount is larger than any loan ever offered by the United States Government, since the Civil War; and even with the $515,000,000 6 per cents which our Government authorized in 1862, the sale was spread out over a long series of months. Our Spanish War loan of 1898 was only for $200,000,000, though it elicited offers to subscribe which aggregated $1,500,000,000. No railway or corporation loan for more than $100,000,000 has ever been placed by public subscription in this country.

The circumstances under which the pending European loan was offered are even more exceptional. No two European governments have ever before combined in a joint loan. No government of the highest class has ever before placed a loan in a foreign country, contracting to pay interest and principal in the money of that country, and engaging that all the proceeds shall be spent in that country's commercial markets. The reasons for this stipulation are of a quite exceptional character; they do not indicate, as has usually been the case with Chinese, Argentine, and Turkish loans floated in Europe, that the lending bankers made such an arrangement their ultimatum. The well-recognized problem presented by the negotiations of the Anglo-French loan was to establish a credit fund in America, on which those Governments might draw to pay for American purchases, instead of drawing exchange on London against all of them. No way of checking the consequent demoralizing fall in sterling exchange seemed to exist except the establishment of this American credit. It was to the interest of London and Paris that expenditure of the proceeds in America should be stipulated. The fixing of "dollar values" for the bonds was equally natural, under the circumstances.

The report of the American Committee on Armenian Atrocities not only confirms previous accounts, but throws the responsibility for repeated persecutions squarely upon Constantinople. The first statements concerned murder and torture chiefly in Van, Trebizond, and the Caucasus region, where they might have been traceable to irresponsible Governors. It is now clear that by general orders the Turkish Government has tried to strip all the provinces of Armenia of their population, and that nearly 1,500,000 people have been set marching towards the Mesopotamian wilderness to live among Arab and Kurdish savage tribes. The consequent suffering is vividly set forth in the 20,000 words of original narratives sent to the Committee from all parts of Armenia. There is already in this country an American Armenian Relief Fund Committee, which has issued repeated appeals for assistance. The most effective action that can be taken by the neutral nations of the world is in exerting moral, if not diplomatic, pressure upon the German Government to check its ally. German representatives in this country should already be able to let Berlin understand how severely it will suffer in public sentiment if it does not attempt to call a halt upon Turkey's ruthless official orders and her deliberate inflaming of ruthless tribes. When the Kaiser first extended a friendly hand to Turkey in 1898, following the atrocities denounced by Gladstone, it is melancholy to remember that the hope was expressed that he might exercise the restraining influence now so much needed.

We are glad to call the attention of our readers to the fact that the offer of one of the "moderately rich" to give $2,000 to a war-relief fund, provided nine other readers of the *Nation* agreed to do likewise, has elicited generous replies not only from members of his designated class, but also from a representative of the "moderately poor." In our issue of last week we published a letter from a resident of Chicago who threatened to contribute $2,000 for the benefit of sufferers from the European war whether or not ten readers of the *Nation* could be found of like mind. And in the issue of to-day there is a communication from a third person willing to donate $2,000 and one from a man blessed with fewer worldly possessions who nevertheless has come forward with a check for $100. It is a source of great satisfaction to the *Nation* that through its columns the work of ameliorating the conditions of those who are experiencing the most extreme privations is in some measure advanced. We trust that other readers may be found who will feel impelled to give of their means, and thus to help on a service well worth their devotion. For convenience we append a list of four agencies in New York city to which contributions may be made: Belgian Relief Commission, 281 Fifth Avenue; Polish Victims' Relief Fund, 33 West 42d Street; German Red Cross, 1123 Broadway, Serbian Agricultural Relief Committee, 70 Fifth Avenue, and the American Committee on Armenian Atrocities, care of Charles R. Crane, 70 Fifth Avenue.

In the delicate task of preparing a platform on which the Progressives can unite with them, the Massachusetts Republicans have done well. Charles Sumner Bird's letter to Candidate McCall showed that there is no insuperable obstacle in the way of a reunion. The Progressive leader emphasized the necessity of including "the social welfare planks that have been a part of the Progressive platform," and of castigating a national Democratic Administration that "endangers the domestic well-being, as well as the national safety, of the country." Mr. Bird admitted that McCall had won his nomination upon his advocacy of progressive social measures; and certainly the recent record of Bay State legislation, Democratic and Republican, shows no indifference to advanced lawmaking. The platform which the Republicans adopted on Saturday of last week advocates a Constitutional Convention, biennial elections, a short ballot, an executive revision of the tariff by an independent commission,

and national legislation upon hours of labor and the employment of women and children. As for castigating Democracy, it denounces the Mexican policy, the tariff, and the failure to effect military and naval preparedness. Could Mr. Bird ask any more? After his letter, the great number of voters who look to him and to Joseph Walker—also ready to return—will find it hard to agree to the statement of the irreconcilable Progressive candidate, Nelson B. Clark, that reunion is unthinkable.

The decision of the United States District Court at Philadelphia against the so-called Moving-Picture Trust reaffirms the principle laid down in previous cases, that the right of a patentee cannot override the barrier against illegal restraint of trade. Monopoly in a sense and to a certain degree is conferred by the granting of a patent, but not monopoly in every sense and to any degree. The other argument put forward by the defendants may strike laymen as a bit odd for serious presentation in a court. The judges found it possible, however, to treat it seriously while denying its validity. "Very laudable" it terms the motives advanced, although these were admittedly mixed, being compounded of a "desire to allay bickering and recriminations" among the defendants, "to advance and improve the art, to protect the morals of the public," and, incidentally, "to make money." The court sees these motives, but it sees also the illegal restraint of trade that their carrying out in the way attempted by the Trust would involve, and so finds its course clear. To the ingenuity of the defendants it leaves the devising of a method for dissolving the combination with a minimum loss of its ethical and pecuniary advantages.

Less than six months ago the wires carried the first uninterrupted telephone conversation between New York and San Francisco; on Wednesday of last week wireless speech was transmitted between the Naval Station at Arlington, Va., and Mare Island, Cal., a distance of 2,500 miles, and then, to make the wonder even greater, between Washington and Pearl Harbor, Hawaii, a distance of 4,600 miles. Since communication was established by wireless telegraphy between Europe and America in 1907, it has been a foregone conclusion that wireless telephony would soon cover equal distances. The achievement which Secretary Daniels has announced, however, comes with startling suddenness, for we have heard little of the experiments on a smaller scale which would supposedly precede it. What the development of wireless telephony will be, only the future can show, and it will undoubtedly be great. But there can be no tendency to repeat the mistake of a decade ago, when men talked of wireless telegraphy as bound to send all our network of copper wires to the scrap heap. Like Marconi's invention, wireless telephony will be a supplement to, not a substitute for, the vast machinery of wire telephony and telegraphy which the world has built up, and an extension of the range and usefulness of the wire systems. Over the oceans, lakes, and deserts, and other regions where it is impossible to string wires, it should have an immense value. It is predicted that apparatus will at once be devised to enable motor-boats, yachts, and coastwise steamships to communicate with the shore, and that new efforts will be put forth to conquer the atmospheric disturbances which have interfered so much with all wireless communication. Its rivalry with wireless telegraphy will probably be much the same as the rivalry between the old telephone and telegraph.

For the years of the war, Columbia will have been the largest university in the world. If she achieves the expected registration of 18,000 by next spring, she will beyond much doubt have reached a lasting primacy. Only by going back over the record of the last decade can the amazing growth of the Morningside institution be appreciated. It was not until 1907 that the total of students passed six thousand. In 1909 it was 8,400; in 1911, 10,350; in 1913, 13,600. Already, with many late registrations for this semester and all those of next February to be added, the registration has reached 14,575. The largest single factor in this growth has been the extension courses. It is to be hoped that they may be expanded and made the means of reaching a greater and greater mass of the public; and that it will not be thought necessary to push further the action just taken in increasing tuition. For this year the second largest factor is apparently the election of graduate courses by many students who would normally have gone to Europe. Universities without large summer or extension schools will call in question the justice of using Columbia's figures in comparison with their own, which represent only full-time students. But even in resident students Columbia's total is first in America, and it is quite proper to use her larger figures parallel with those, for example, of the loosely organized student body of the University of Paris.

A literary restoration of some note is that of Bronson Alcott's "Fruitlands," for which our own and later generations may thank Miss Clara E. Sears, the author of the latest book on the "Consociate Family" of the eccentric lecturer. When Miss Sears bought the place two years ago, the *Dial* records, it was dilapidated, weather-beaten, and empty. Zeal and a generous expenditure of money have now put it back into its condition of sixty-two years ago, when Alcott and his visionary reformers took up their residence there. So far as possible, the original furniture is restored, and Miss Sears writes that "the house is now exactly as it was in 1843. The foundations of the chimneys were intact, so that I was able to rebuild them as they were. The paint had entirely disappeared with time, but under the eaves remained patches of red, and I was able to give it again the old ochre-red color." The old granary has been turned into a home for the caretaker, and during the summer the house is open three days in the week. Visitors may see the community bean-pot, Joseph Palmer's ox-skin money-bag, Charles Lane's cowhide trunk, Mrs. Alcott's Paisley shawl, letters of Louisa Alcott, and Mr. Alcott's spectacles.

The world will prefer to remember Rémy de Gourmont as critic and journalist rather than as satirist and romancer. His most familiar book in English translation, the "Nuit au Luxembourg," is a compound of pseudo-mysticism and worse elements of French decadence; but he was capable of a far more healthy and vigorous note. His activities as editor of the *Mercure de France* continued up to his death, and to him is largely traceable the piquant radicalism of the little blue magazine. The last issues contained some characteristically witty and mordant "Epilogues; M. Croquant et la Guerre." His more earnest side is shown by another recent journalistic contribution to the literature of the conflict, a book upon "Literary Belgium," enthusiastic in its estimate of Verhaeren, Rodenbach, and Maeterlinck. But the solid basis for his reputation as an accomplished writer and an acute if erratic thinker rests upon his three series of "Réflexions sur la Vie," his five series of "Promenades Littéraires," and his books upon style—"Esthétique de la Langue Française" and "Le Problème du Style." If he had too little of serious philosophy, he had a vein from which many curious bits of imagination and speculation could be brought up—and he was never dull.

BULGARIA'S TACTICS.

For an explanation of Bulgaria's tortuous policy of "armed neutrality," we must look to the same law of necessity which was quoted to justify the invasion of Belgium. That Bulgaria is planning to enter the war on the side of Germany there can now be very little doubt. Sofia denies that Teuton officers have come to her assistance, or that German money has been used for expenses of mobilization. But the charge made by Sir Edward Grey the other day, and formally repeated in the Russian ultimatum, is pretty conclusive evidence as to that. Governments do not usually accuse other Governments in this way unless the facts are clear, nor, what is more important, until the other Government is so committed that there can be no harm in ruffling its feelings. Yet Sofia denies, and she will go on denying until she is ready to strike, at which moment the law of necessity will enter to justify the diplomatic denial. Bulgaria's national existence being at stake, who shall blame her for resorting to a pious subterfuge while arming herself against a possible ring of enemies? In addition, of course, there will be the hostile attitude of Servia, the Greek mobilization, the movement of Allied troops towards the Bulgarian front, to supplement the law of necessity, as justification for Bulgaria's lack of "frankness."

The example of the law of necessity and Belgium might not be altogether encouraging to a nation anxious to make out a moral case, but Bulgaria is not interested in ethics. For the world's opinion she cares little, and for immediate military gain she cares a great deal. On that point Belgium is still there to show that a sudden and ruthless stroke pays. In the present warfare by trenches and siege, that which you grab is fairly easy to hold. A sudden declaration of war, a swift dash into the enemy's territory, and then settle down for the winter and let the enemy go at the business of dislodging you. Seize, intrench, hold on. The Bulgarian army is surely equal in efficiency to the Turkish army, which only three years ago it drove before it almost to the gates of Constantinople. Yet see what the Turks, under German instruction, have been doing for the last six months in Gallipoli. Under present conditions, the first blow counts more than ever, and Bulgaria's "armed neutrality" is plainly directed towards a sudden offensive followed by a long defence. This policy of not hitting out till the very last moment has the added advantage of putting formal responsibility for hostilities on the other side. The Allies, it is reported, in order to guard against a sudden blow at Servia, have landed troops on Greek soil. Bulgaria, then, may profess to have been forced from her policy of "armed neutrality" into war, greatly to her regret.

We take it, therefore, that the course of the Bulgarian Government is determined, and that the Russian ultimatum was not presented with any hope of producing an eleventh-hour change at Sofia, but as a formal step towards a severance of relations. If any appeal is embodied in the note, it is directed not to the Government, but to the people of Bulgaria. To them Russia speaks as the great Slav Power who even to-day is clad with a halo of might and glory for the small and scattered Slav peoples of Europe. She speaks more specifically as the virtual creator of Bulgaria, since it was Russia's armies in 1877-78 that brought into being the nation of to-day. It was the Congress of Berlin that denied to the Bulgarian people the boundaries which Russia won for them at San Stefano, and which they have waged two wars and are preparing to wage a third in order to regain. If one believes too closely in the logic of history, the present is an impossible situation. It is hard to imagine Bulgaria joining hands with Turkey against Russia and Servia, with the Government of the Bashi-Bazouks against the brother-people who first gave the signal for insurrection in the Balkans forty years ago, and against the Power which stepped in and turned that desperate revolt of a handful of people into a successful war of emancipation.

But the Bulgarian Government can point to august examples of flaws in the logic of history, and so far as the Bulgarian people are concerned, the sense of racial affiliation, though present, no doubt, has been overlaid with recent hatreds and—as the Bulgarians regard it—betrayals. "Armed neutrality" as a preparation for a sudden onset against Servia or Greece is a venial fault indeed to a nation that regards itself as the victim of an outrageous spoliation, carried through by treacherous allies. As between Sofia on the one side and Servia and Greece on the other, there can be no question of honor or punctilio. So Bulgaria's hatred for her former allies supplements the argument from military expediency—strike hard and suddenly. Two years ago, to be sure, in that very war against her allies which resulted so disastrously for her, Bulgaria found that the policy of ruthlessness does not always work. Her sudden attack on the Serbo-Greek forces failed, and when the Bulgarian army fell back on the capital it was only to find that her allies had foreseen a break and had taken precautions, in the form of an agreement with Rumania, which left Bulgaria isolated and encircled.

The question is whether Bulgarian diplomacy has been more circumspect to-day than it was two years ago. In case Bulgaria attacks Servia, she has Greece to reckon with on the west, an Allied army on the south, and possibly Rumania on the north. Among the startling changes in the Balkans, of which the entrance of Bulgaria on Germany's side is one instance, another is that of Greece forced to the side of the Allies after definitely showing her divided sympathies. Has King Constantine been carried off his feet by the force of events? Or has the astute Venizelos, the creator of the first Balkan League, the creator of the Rumanian agreement that preceded the second Balkan war, had his way with the King and reëstablished the arrangement of that year? That may yet turn out to be among the "adequate preparations" which, according to Paris, the Allies have made for all eventualities.

THE EUROPEAN LOAN.

We have received, in regard to the $500,000,000 5 per cent. loan—now placed by the English and French Governments with the American bankers—a number of letters of inquiry or comment. Most of them reached us before the financial public had this week given rather unmistakable evidence of a wish to participate in the loan. Some of them approved the operation unreservedly, and on purely financial grounds. Others argued that, from the financial point of view alone, the transaction would be unwise for the American banks and people. It is to the inquiries or arguments last mentioned that the discussion ought rightly to address itself. The political contention—the argument that to grant the loan would be "unneutral"—has no longer any standing since the facts became known, not only that a $10,000,000 German Government loan was placed in the United States last spring, but that the new war bonds which the German Government is now issuing at Berlin have this month been offered in New York, by public advertisement, to American investors. But the question whether the Anglo-French loan would be a safe investment, or whether our people ought or ought not to lend so great a sum, would still remain open for discussion.

One of these letters of inquiry bluntly

asks: "Will you tell your readers whether you consider the loan a good investment from a business standpoint, leaving all other reasons out of consideration?" To this question, we reply with equal frankness that we do so consider it. For believing the loan to be a good investment, purely from a business standpoint, there are, in our opinion, three reasons: First, the loan is absolutely sound; of the ability of the two Governments to pay interest and principal at the stipulated time, and in American money as contracted, there appears to us to be not the slightest doubt.

Secondly, the ability of the American investing community to take care of a $500,000,000 loan, if it sees fit to do so, has been proved by many of the familiar tests. These are the almost unexampled magnitude of the idle deposit fund in American banks, the great ease in our money markets, the unusually small aggregate of new home securities which have this year been offered to investors, and the fact that idle funds available for investment have been pressing on the speculative stock market, with such intensity as to create in that quarter a highly undesirable situation. And in the third place, we consider the loan to be a good investment from the purely commercial standpoint, because its purpose is, through use of the proceeds in payment for purchases of American goods, to restore some sort of equilibrium in the foreign exchange market. The abnormal depreciation in that market, and the violent fluctuation of rates, had already begun to reduce many of our largest exporting and importing trades to a footing of precarious speculation.

These, as we see it, are the broader underlying principles. There remain some specific objections raised by our correspondents. One of them argues that the prospect of a victory for the Allies is not over-bright, and that their defeat might subordinate the loan, as a lien on English and French resources, to a huge war indemnity. This is a perfectly proper consideration; it will be judged, however, both by the intrinsic probabilities of precisely that outcome to the war, and by the economic power of the two Governments. Such an indemnity would be provided for, as in France after 1871, by another public loan; therefore the question does not differ in kind from the question whether the two nations are financially able to continue the present war.

Another correspondent lays stress on the fact that fiscal necessities are driving the European belligerents to a basis of irredeemable paper currency. The depreciation of the foreign exchanges, he argues, is either a consequence or a foreshadowing of such conditions; which would gravely impair the soundness of the loan. To this there is one obvious answer—namely, that a Government's inability to redeem its currency in gold has nothing whatever to do with that Government's ability or inability to pay its debts.

On that question, a great deal of mental confusion seems to exist. An inflated and depreciated currency is a grave economic evil; but the financial and economic resources of the country afflicted with it continue to exist. Our own Civil War loans were floated in a period when our currency, irredeemable in gold, sold at as great a discount in our own markets as 60 per cent. Yet even the European markets subscribed to the new United States war loans. They relied on the wealth and economic power of the country. The bonds were paid, interest and principal, in gold, and the stipulation to that effect will be far more binding, in the case of the pending loan, than it was in our own war issues.

One further criticism raised is that to grant the proposed European loan would be "to advance money to a customer who cannot pay for the goods he wants to buy, in order to induce and enable him to buy more." If this were actually the situation, it would provide ground for approaching the operation at least with great caution. But the assertion is based on complete misapprehension. There has at no time been a question of the ability of England and France to pay for their purchases in this country. The loan is offered here, simply in order that, through drafts on a credit fund in America, the Governments concerned may make a part of their American payments without further disturbing the market for international exchange.

Nothing is more familiar, in the history of international finance, than precisely such an operation, arranged for precisely such a purpose. Our own markets have repeatedly sold to England large blocks of new or old American securities, with the same economic end in view. To equalize, through just that process of making loans to a foreign community, the inequalities of an international balance of liabilities, has for decades been the particular office of London as the financial centre of the world. If circumstances have brought it about that the American market occupies, for the time of war, that position of distinction, it cannot reasonably refuse to consider the responsibilities which come with it.

FOR ARMENIA.

Our action in behalf of the unhappy Armenians has so far been confined to an "informal" request addressed to Count von Bernstorff suggesting the exercise of German influence in Turkey. There is no question that the atrocities visited upon the Armenians are inspired from Constantinople as part of a regular policy which continues the worst traditions of the Hamidian tactics. Apparently, the only reply to our plea has been a statement from von Bernstorff quoting the authority of a German Consul to the effect that the reports from Asia Minor have been greatly exaggerated. It is an echo of Germany's curt finality regarding the "armed Lusitania," regarding the "hostile Arabic," regarding ever so many questions upon which a mere assertion from Berlin has been held to establish that a thing is so, in the face of overwhelming evidence to the contrary. But the evidence piling in from Armenia, through missionary, commercial, and private sources, refuses to be so dismissed. The intimation that these charges have been inspired from Petrograd for obvious reasons, is an insult to the disinterested men and women who for years have labored in Turkey and who are in the best position to know. Their evidence is not prejudiced. American missionaries have no dislike for the Turkish people. It is quite the other way. The good qualities of the Mohammedan population, when freed from evil suggestion from Constantinople, have always been emphasized by our missionaries. If they now speak out against what bears many signs of a deliberate attempt to extirpate a race, something more than an "unanswerable" official communication from German sources is called for.

The exigencies of war will not explain the deportations in mass of the Armenian population, not to speak of massacres, enforced conversions, and wholesale imprisonments. When the press of this country protested against the hardships visited upon the people of Poland, and notably the Jews, Petrograd was at pains to emphasize the inevitable conditions arising in an area of war. The answer was insufficient, but it contained a *prima facie* justification. It is different with the Armenians. The fighting in the Caucasus has touched only the frontiers of Turkey. The operations in the Caucasus have from the first assumed the character of deadlock, and are bound so to continue, with no sweeping back and forth of armies such

as has brought woe upon Poland. It is not in the area of war alone that the Armenians are suffering, but hundreds of miles behind the Turkish front, in Harput, in Sivas, in Marash, in Haidjin. In these remote places there cannot be the slightest question of Armenians lending aid and comfort to the enemy. Thither have flocked the refugees from the frontier of war and the population forcibly deported. The Government's hatred has followed them into their places of refuge. We are evidently dealing, not with the passions and lusts of a war-maddened soldiery, but with a deliberate policy of persecution.

On the grounds of humanity, on the grounds of our special interest in the Armenian people, who, as the *Outlook* states, have come forth as a race largely through the efforts of American missionaries, we are entitled to address our protests in the only quarter where they have a chance of being listened to. If Berlin intimates that the Armenian question has been brought forward as part of a pro-Ally campaign, it will only be assuming that blindly partisan attitude which Berlin is so fond of ascribing to the American press. Our newspapers did not allow their sympathies to stand in the way of sharp protest against Russia's treatment of the Jews. To the extent that there have been Russian atrocities they have been described with great detail in most of the metropolitan newspapers; and between conditions in Poland and in Armenia, so far as the responsibility of the respective Governments and the magnitude of the evil are concerned, there can be no comparison. Nor has our public protest been without avail. The Polish population, expelled by the exigencies of war, have had refuge in the interior of Russia. Measures for their relief, carried on under the limitations of Russian efficiency, are being worked on a large scale. The Jews of the Pale have been permitted to settle everywhere in Russia outside of the two capitals. This may not be evidence of a change of heart on the part of the Russian Government. But if it has been forced by public opinion in neutral countries, there is all the more reason for bringing pressure to bear in behalf of Armenia.

The great difference is that Constantinople is impervious to the opinion of the outside world. The men in control are fighting a desperate battle, and may feel at liberty to disregard neutral susceptibilities. But Berlin has shown recently that it does not hold American opinion so lightly. Were we to exercise pressure directly upon Turkey, the German Government would have much more ground to suspect our motives than if we protest to Berlin. We are thereby recognizing German paramountcy in Turkish affairs, even if we couple German responsibility with German ascendency. We need not emphasize too far the anomalies of the Teuton-Turkish alliance, but a German alliance with a Government that is systematically engaged in destroying a Christian folk must fall sharply even on a world's conscience hardened by many disillusions. So far as sentiment in this country is concerned, Germany's moral battle-front has been irreparably damaged on its northern flank in Belgium. It cannot be that Berlin is content to allow another Belgium to develop on its southern flank in Armenia.

THE ETHICS OF REPUDIATION.

It is a matter of extremely little moment whether Mr. Henry Ford did or did not make the following statement, which has been credited to him in the newspapers:

> If I were to live with the future generations of Europe, I would urge the people to repudiate the debts that are being piled up by their Governments in this war. I believe it is the duty of the people to repudiate them.

Mr. Ford's title to be regarded as an authority upon the fundamental principles of ethics is of the slightest; and as for the question whether the opinion above expressed needs to be taken seriously as a practical matter, the way in which the successive loans of the various warring countries have been taken up sufficiently disposes of that. The thought of infidelity to national obligations is practically non-existent.

Nevertheless, it may be by no means unprofitable to give some thought to this utterance of Mr. Ford's. We have little doubt that he said what has been ascribed to him; and we have no doubt whatever that he is an honest man. And the question is, How can an honest man persuade himself that it is the duty of the people to repudiate a debt contracted for them by their Government? It will be noticed that he does not predicate his view upon any peculiarity in the structure of the Government; he means it to apply as much to France and England as to Germany. The question in his mind is not at all as to the rightfulness of the authority of any of the Governments that control the affairs of the nations to-day; future generations will have the right to repudiate—nay, the duty to repudiate—the obligations incurred for the prosecution of the war, not because the Governments were not legitimately clothed with their powers by the people of to-day, but because the people of to-morrow will know that the use that was made of the power was a bad one. And while the fact that Mr. Ford has expressed this view is in itself unimportant, we have little doubt that there are a number of good persons who feel somewhat the same way, and that the time will come when the people who feel that way will make a good deal of noise in the world.

And yet the notion is in the highest degree vicious, and ought to excite the instinctive abhorrence of every right-thinking man. Let it be granted that the time will come when war will be universally regarded as wrong under all circumstances; that men will not only have found means to prevent all war in the future, but will have come to the conclusion that no nation was ever justified in taking up arms in the past, whatever situation may have confronted it. Let us imagine that men will come to believe that it would have been better for mankind if Greece, instead of fighting at Thermopylæ and Marathon and Salamis, had meekly submitted to the Persian yoke; if Christian Europe had allowed herself to be overrun by the Moslem hordes; if, to come nearer home, the American Union had been dissolved, instead of having been preserved by the devotion of the armies whose last worn remnants passed in pathetic review before the President the other day. Even so, nobody would have either the audacity or the fatuity to say that the soldiers who fought for the right "as God gave them to see the right" were engaged in a criminal enterprise, that the statesmen who directed the country's policy were no better than usurpers, and that consequently any obligations incurred by them on behalf of the nation should be regarded as null and void. And yet, short of this, what possible warrant can there be for repudiating the war debt? Surely, the Englishman, or the Frenchman, or the German who lends his money to the Government in the time of his country's need is not on a lower moral plane than the man who invests his money in other ways; and to repudiate the debt means to rob those who did what was regarded by their countrymen as not only an innocent but a meritorious act, for the benefit of those who chose to make a different use of their possessions.

When we say that we think it not unlikely that this doctrine of the repudiation of war debts will some day make a good deal of noise in the world—which is a very dif-

ferent thing from saying that it will prevail, or come anywhere near prevailing—we have a very specific reason for expressing that opinion. A precisely analogous doctrine, concerning another great vested interest, was propounded by a writer of rare eloquence and persuasiveness a few decades ago, attracted a great deal of attention, and resulted in the building up of a considerable following, which persists, and even to a considerable extent flourishes, at the present time.

The fundamental teaching of Henry George's "Progress and Poverty" was that property in land is robbery; and, however much this fundamental teaching is overlaid with other matter—some of it distinctly meritorious—the conviction that the ownership of land is robbery, and that its confiscation by the people is a right or a duty, is the rock upon which the faith of Henry George is really built. Our forefathers may have acted right according to their lights; they may have thought—and it may even have been true—that to give individuals the right of permanent ownership of land was the best way to promote agriculture, to encourage thrift, to secure order, to stimulate enterprise, to develop some of the most fundamental of human virtues. It may have been perfectly natural that for these reasons, and for others by no means so good, the institution of private property in land became, ages ago, a basic part of the social and civic organization of all the countries of the world with which we are historically connected, and continued unchallenged to our time.

All this is of not the least consequence to the true Georgeite; once you discover, by a process of reasoning satisfactory to yourself, that land-ownership is criminal, and the man that is landowner ceases to have any rights that you are bound to respect. You don't have to buy him out, and correct the mistake for the future; you simply confiscate, or, if you don't baldly confiscate, you adopt some other course from motives of policy. The question of fair dealing between man and man has nothing to do with the case; in the fierce light of your sudden illumination all such homely considerations fade into nothingness. The cases are as like as two peas; the only question is whether those who have found the doctrine of land-confiscation to their moral taste will be strengthened or weakened in their belief by seeing how easily the same scrap-of-paper view of plain human obligations can be applied in other directions.

A "SCIENTIFIC" PROPHECY.

If Admiral Fiske had written an article to tell us that he was firmly convinced in his own mind that war will forever continue to play as great a part, and the same kind of part, in the future as in the past; that in fact it will in all probability absorb a far greater share of the intellect and energy of mankind than it has yet done; that any expectation of a change in the disposition of nations towards one another is illusory and doomed to sure disappointment—if the gallant Rear-Admiral had set forth these things, in an article in the *North American Review* or elsewhere, everybody would have attached to it just such importance or interest as may naturally be supposed to belong to a personal confession of faith. But almost in the first sentence of his article on "The Mastery of the World," a claim to much more serious consideration is set up: the author says that in his discussion of the subject he proposes to "follow the inductive method of modern science."

The Admiral's idea of "the inductive method of modern science" appears to be so rudimentary that it would be a compliment to call it archaic. We should have to go very far back indeed into the dim beginnings of scientific thought to reach a time when from data so meagre, so undigested, and so vague, conclusions of sweeping import were supposed to be capable of being inferred. Persons of the class that Prof. William James designated as "tough-minded" point out the inadequacy of one of the arguments upon which pacifists base their expectation of a federation of the world which shall insure universal peace. This argument turns on the gradual expulsion of physical force as the agency for settling controversies in one department after another of human life. Broadly speaking, they find that the world has managed to abolish that crude recourse in everything except the relations of nations to one another; and they insist that it will take far less of a change in the instincts and habits of human beings to achieve this last advance than it has taken to accomplish the extinction of internal violence, clan warfare, the vendetta, and the duello. Whether conclusive or not, this reasoning at least makes no pretension to scientific accuracy. Admiral Fiske's argument, on the other hand, seeks to deduce the future of mankind from a crude diagram of its past history; a diagram which, to have any value, would require to be founded upon a great array of carefully ascertained and measured facts, and not upon those vague impressions of the course of history which alone furnish the material for Admiral Fiske's vaticination. And even were the diagram authentic and exact, the next step—that of continuing the curve indefinitely along the line that seemed to be indicated—would be a proceeding so rash that "modern science" is the last quarter to be appealed to for its justification.

"These considerations," says the Admiral, when he is getting on towards the conclusion of his article, "seem to indicate that nations regarded in their relation towards each other will go on in the direction in which they have been going, unless acted upon by some external force. Will civilization, commerce, or Christianity impart that force?" His answer, it is hardly necessary to say, is No. But there is no method known to science by which we can judge of the effects that are even now being produced in the minds of men by the agency of either external or internal forces. Admiral Fiske is peculiarly certain, for example, that commercial factors will in the future be even more potent than in the past in arraying nations against one another in bloody wars. What possible warrant can he have for assuming that a more enlightened view of the real interests of nations, even as measured by dollars and cents, will not bring about a wholly different attitude? How can he know that even at the end of this terrible war the clear demonstration which it shall have furnished of the utter insignificance of the commercial elements at stake, in comparison with the stupendous sacrifices of the conflict, will not make a profound and permanent impression on the minds of men the world over? As for judging the future by the past, how long has there existed any great body of men who avow the community of interests of all nations, and are in principle opposed to all wars except those strictly required for self-defence? To ignore elements like these and rely on the apparent indications of a rudimentary diagram is to be not scientific, but childish.

It is somewhat amusing to place in juxtaposition with this manifestation of simple faith in "science" an utterance equally naïve that comes from a very different quarter. Mr. H. G. Wells is a gifted writer; but his gifts are those of a youthful prodigy unable to take on quite fully the responsibilities of mature age. Let us see what *he* thinks, in the person of his latest hero, on the subject of science and the future of mankind:

It is only now, after some years of study and living, that I begin to realize what this tremendous beginning we call Science means to mankind. Every condition that once jus-

tified the rules and imperatives, the manners and customs, the sentiments, the morality, the laws and limitations which make up the common life, has been or is being destroyed. . . . Two or three hundred years more and all that life will be as much a thing past and done with as the life that was lived in the age of unpolished stone.

And the future of nations is no less distinctly set forth by the hero's friend and comrade:

The world has to be a united world, Beuham, as a matter of course. That was settled when the railways and the telegraph came. Telephones, wireless telegraphy, aeroplanes insist on it. We've got to mediatize all this stuff, all these little crowns and boundaries and creeds and so on, that stand in the way. Just as Italy had to be united in spite of all the rotten little dukes and princes and republics, just as Germany had to be united in spite of its scores of kingdoms and duchies and liberties, so now the world.

Prophecy for prophecy, the vision of a united world is the more pleasing to contemplate; and it has quite as much scientific warrant. As for the other notion, that radium and ions and non-Euclidian geometry are going to make a clean sweep of foolish old inheritances like love, and filial attachment, and jealousy, and the rest of the things that have hitherto filled the lives of "the kindly race of men," we have just put that in for good measure, to show what the pseudo-scientist on a rampage can do if he likes.

Foreign Correspondence

THE SITUATION OF ALSACE-LORRAINE —THE COMPLETE FAILURE OF PRUSSIANISM.

By STODDARD DEWEY.

PARIS, September 18.

Every official declaration of France—of the President of the Republic, of the Prime Minister, of the General commanding in chief—ever since this war began has given as one of the necessary conditions of peace the return of Alsace-Lorraine to France. Virtually, all the Allies—England, Russia, Italy—are engaged to it. Like the restoration of Belgium and Luxemburg and Poland, it has to be fought for until it is won. There is and can be no question of autonomy in a renewed German Confederation, nor of the creation of a buffer state equally independent of Germany and France. It is not to be conquest and not annexation or re-annexation on the part of France. Even French Socialists and workmen's associations have said all this in their turn.

To use the Labor phrase of France, this war must end by consecrating "the right of a people to dispose of itself." Now the conquest of Alsace-Lorraine by Germany in 1871 —an annexation of territory which pretended to no other right than that of conquest—was the negation of this right. The Treaty of Frankfort ratifying the annexation was forced on France by Germany, and itself stated explicitly that treaties are "annulled by war" (article 11). Well, Germany has made war, the Treaty of Frankfort has been annulled by herself—and, legally, Alsace-Lorraine is *in statu quo ante bellum*, that is, what she was before 1870.

In practice, this means that the war, among other things, disputes whether Alsace-Lorraine shall return to France, from which she was forcibly detached forty-four years ago. And France and the Allies have bound themselves to fight until Alsace-Lorraine does so return.

Francis Joseph, when the conquest of Alsace-Lorraine by armed force against the expressed wish of its people was finally announced to him, is said to have presented ironic compliments to the old Kaiser "on his annexation of an open sore to his new Empire." It is one of the heart-breaks of history that countries like England and the United States, supposedly won to the cause of the Liberty of Peoples, should have allowed this violent transference of 2,000,000 highly civilized and prosperous human beings from one government, to which they were used, to another, to which forty-four years of rule has not accustomed them. Counting those who were honorably placed in France, 2,000,000 is a moderate figure for the population at that time. They were quite comparable with Americans at the time when our Revolution established the consent of the governed as indispensable to legitimate government.

It is a mistake of blindness to imagine Frenchmen's desire of *la revanche* in Alsace-Lorraine as a principal cause of this war. Rather, it was the encouragement given by free countries like ourselves to new Germany which has led on to this latest working out of her fundamental principle that Might makes Right.

There is a disposition on the part of wavering neutrals to claim a sort of prescription—vested rights—for the German immigrants into Alsace-Lorraine during these forty-four years that it has been an "Empire-land." Their number is estimated liberally at 350,000 —fewer than the native Alsatians and Lorraine-men who have voluntarily chosen to live in France and remain shut out from their native country. And this does not include the Alsatian thousands who have emigrated further, often after trying for some years to live under German rule, to America and South Africa, or to Switzerland, near to home.

There has been, too, a vital difference between these immigrants and emigrants. The incoming Germans, for by far the most part, have formed an Imperial service plastered on the country, crowding out the natives from posts of confidence which rightfully belonged to them. An Alsatian could not be a school-teacher—he could not be trusted to Germanize the children's brains. He could not hope to enter the university corps—Prussians despised his German and thoroughly distrusted his willingness to accept their discipline. He had to serve in the German army, but never in garrisons of his own country—it was necessary he should be broken in elsewhere. He could not expect to become an officer. He could not occupy any judicial post of honor and, still less, any responsible post in the administration of his own country. Even his business activities and industrial enterprise were hampered by discriminating regulations and political preferences.

For two generations Imperial Germany has had a free hand with the populations of Alsace and Lorraine, and, by her own confession, she has won neither affection nor respect, and dares not to repose her trust in them. Surely, by all the principles of our American Independence, the return of their country to France should be a matter of common right.

Perhaps Americans are not alive to the part always taken in French public life by citizens from Alsace and Lorraine. Those of French language were, of course, quite indistinguishable. Even now, there are generals and there have been Ministers of War, there are university professors at the Sorbonne and the Collège de France, there are judges and presidents of chambers of commerce, who speak to their brother Frenchmen with authority in their own comfortable accent. It might even be said that, from the Revolution to our own day, Alsatians have had more than their share in French public life. The two languages of most of them gave them an initial advantage, which the canny, easily-mixing ways of their race heightened. Under Germany, the natives of Alsace and Lorraine have been made to descend towards a condition of inferiors—diminished subjects of an Empire which they were made to feel was not their own. In France, not by any deep design, but quite naturally as water flows, they have been exalted citizens.

It must not be thought that this is merely the impression of an outsider or the idea of a partisan native who has burst the bonds of the conqueror. I was first a child with Alsatians who had but lately founded a colony in America. Later I made acquaintance with their people before their country had been broken off from France. At the time when they had to choose between exile for their young men or Prussian militarization, I followed their lives at home. There is the pathetic comedy of children exaggerating the goose-step to which their alien schoolmasters condemn them—and the moan of native songs sung for a last time at home by those who are fleeing away. In among the mountain villages, where the emerald pines lead up to the country's thousand-year-old pilgrimage of St. Odile, in the manufacturing towns of the plain, in peasant farms, I have found—after two generations—nothing but impatience and dislike of German rule. Those who had never known French rule—which, under all régimes, is at least democratic—had always France in their minds as the country of ease and grace and liberty.

More than this, one of the "immigrants" who had had the weakness to marry a woman of the country and tried to identify himself with its interests, ventured half a dozen years ago to give me his own views in his newly acquired French. For him, German born and bred as he was, everything was going wrong. The most that Germany could hope for was the final constitution of Alsace and Lorraine into virtually independent states, whose interest it would be to act as a buffer impartially between Germany and France. He had no sympathy and no belief in the possibility of ever Germanizing Alsace and Lorraine.

It is difficult to say what might have been. Gen. Joffre, in the second entrance into Alsace of the armies of France during this war, took it on himself to reassure the population. "You are French once more—nothing shall be able to take you from us again!" Without prophecy, it is more than likely

that—after the war—men of Alsace and Lorraine will again take their part in all the public life of the French Republic. Perhaps it is for that the German army destroyed the family tomb of President Poincaré in Lorraine.

SWISS NOTES—ESPIONAGE AND NEUTRALITY.

By ARCHIBALD ALEXANDER.

GENEVA, September 9.

Owing to the increase of espionage in Switzerland, the political police are showing renewed activity. Within a week, sixty persons suspected of being spies or known to be such have been arrested and sent to Berne for trial. Among them was a French woman, twenty-two years of age, who was apprehended at Geneva. Ever since the probability of Switzerland going to war became remote, the attention of spies in that country has been diverted from the organization, efficiency, and distribution of the Swiss troops. In this respect, Swiss military preparations are an open book. A year ago, however, when the neutrality of the Federation seemed to be in peril, a great deal of curiosity was manifested by apparently harmless visitors from across the Rhine. While crowds left the big hotels, there lingered in certain Alpine resorts strangers who spoke French with a German accent, and whose German was not that of the Swiss cantons. Some of these visitors remained on the plain along the frontier near Schaffhausen and Bâle; some betook themselves to the Jura near the fortified region of Le Trou de Bourgogne; but there were others who seemed to prefer the bold scenery not far from St. Maurice and its fortifications, as well as the quiet villages where there were cantonments of troops. The questions of these strangers were often indiscreet. In one village within easy walking distance from the great fortress of Dailly, into which no profane may enter, a quiet, melancholy-looking German was arrested four times in one month by the officer commanding a battalion in the village, although there was no direct evidence of his being a spy. He made a practice, however, of getting as near the forts as possible, and of asking many questions of the officers and men in the neighboring cantonments. He was up at daybreak to listen to the *Diane* and to watch the men depart for their daily exercises. He was on hand to witness their return, retired when the *Retraite* was sounded, and left his bed, even on a stormy night, when the "general" alarm was heard. The Swiss commanding officer cooled his zeal by telling him that if he did not restrain his curiosity, he might be obliged to spend the winter in the high Alps.

At present, there may seem little to attract spies to Switzerland, especially to Geneva, where they are very numerous. The Swiss frontier from Verrières to Schaffhausen is not altogether inaccessible to civilians. Many of the military preparations there are perfectly well known. Bâle, for example, is so near the border that people in the town often hear the sound of the French and German artillery; they can watch the manœuvres of aeroplanes, and they can get reports from the front almost at first hand. In towns like Zürich and Geneva, the case is different. At Geneva it is altogether different. Except on Sundays, when furlough is granted to some of the troops, there are as few soldiers to be seen on the Rue de Rhône as on Broadway. But the Swiss army is no longer the object of espionage. It is at Geneva that news from the belligerents can be most easily obtained and distributed. Apart from the large French population, which has increased since the war began, people from all European countries still throng the streets, and are to be found in public resorts, particularly in the cafés. At the principal café in Geneva, one may hear any afternoon more than a dozen different languages. There is, of course, much gossip; acquaintances are easily made, and the chief topic of conversation is the war. It is easy to understand how much information more or less important and accurate can be picked up in such intercourse. It is also easy to understand that, without very great difficulty, news can be conveyed across the frontier. There is no Swiss censorship of letters sent to foreign countries, and any foreigner here, writing home, may write freely.

The people of Geneva are quite aware that many of these foreign residents have *aures arrectæ*. Just before the war a German established an immense café and restaurant in the busiest street, with places for a thousand persons, and with an excellent orchestra. The place is literally empty by day, and there is only a handful of customers in the evening. Other proprietors with German names often print in their advertisements: "établissement suisse," or "maison suisse." This partial boycotting is caused partly by anti-German sentiment, but partly is attributable to a suspicion that the German spy system is far-reaching and well organized. In one of the new quarters of the town there is a considerable German population, including a number of men of military age. They make no secret of their nationality; they are on friendly terms with the native population. They may be seen in the street or on the verandas of their apartments discussing the war as everybody does, with maps in their hands and German newspapers before them, and writing long documents which they bear to the post office. At first the gendarmes went to the concierges for information about the customs and habits of these aliens. But of late the political police has taken a hand in the game, and some of the more conspicuous members of the group have disappeared. Perquisitions have been made, in some cases, by the police, and certain suspected persons have been called on to give an account of their present occupation, and even the sources of their income. An American resident of the quarter received the visit of a man bearing a German name—"a neighborly visit"—who said that he was a Russian. He afterwards continued these visits without receiving any encouragement. In the autumn he affirmed that the Cossacks would be in Berlin on Christmas Day, 1914. It transpired that he was intimately associated with the band of German suspects. He was greatly interested in America, in its military and naval efficiency, and was anxious to know whether there would be civil war in case the United States took the part of the Allies. The American, with engaging candor, described the transatlantic police force as a machine almost as formidable as the German army.

The spies, or those who appear to be spies, now find it difficult to get their reports across the frontier; so their method has reached a second phase. While the first messengers who carried reports not committed to the post were foreigners, attention is now directed to certain Swiss citizens who have been led into devious paths by informers from abroad, and who, by reason of Swiss neutrality, have less difficulty in crossing and recrossing the border. The Swiss police has discovered organizations whose object is to recruit accomplices among subjects of the Federation. The recruiting agent discovers a promising Swiss, and at first asks him or her to get news for the papers, and commercial information of various kinds. Recruits have been found among Swiss maidservants who are invited to "keep their eyes open." Being well paid in advance for this opening of the eyes, they are caught in the meshes of the organization, and at length may be sent abroad, not only to carry documents, but to collect news, especially as to the situation and transportation of troops. Several Swiss, attracted by this well-paid but dangerous employment, have been arrested abroad, and lately one of them was put to death. It may be added that the political police of Switzerland usually acts with efficiency and prudence: with efficiency in preventing conspiracies against foreign governments being hatched in Swiss territory; with prudence, so that the Federation may not be subjected to foreign dictation. Since the time when Numa Droz wrote to Bismarck with what the Germans regarded as *Schroffheit*, the independence of the Swiss Government has been carefully conserved, except in the matter of the Gothard convention.

The Swiss Government has been much embarrassed in its efforts to censure non-neutral utterances within the country, in speeches, books, and newspapers. Some of the difficulties encountered are already matters of history. The censorship of such publications was committed to the military authorities, and complaints arose from many quarters that the censors were arbitrary or unjust.

The Swiss censorship, however, is not wholly under military control. The Federal Council has lately declared anathema the importation, exposition, and diffusion of all prints (writings or pictures) designed for publicity, including reproductions of publications, which may disturb the good relations of Switzerland with other states, or which cannot be reconciled with its situation as a neutral state. Particular exception is taken to derisive caricatures of foreign rulers and statesmen. The decree of the Council is obscurely expressed. Among the prohibited articles are (1) unsealed writings and pictures—evidently a blow at postcards; (2) reproduction of such writings and pictures by the Swiss press. The decree loses most of its meaning by the recognition on the part of the Council that its powers in this respect are limited; accordingly the decree is not directed against "organes nationaux," newspapers, weeklies, and reviews. In these cases only very grave infractions of neutrality will be punished. No mercy, however, is to be shown to cinematographs.

It cannot be said that the rule concerning postcards has been observed, the illustrations on which are often the reverse of neutral. As for ridicule of foreign magnates, it is enough to say that the Paris comic weeklies are for sale at every news-stand, and they do not spare the feelings even of neutral peoples. Any American would be moved to see in one of them a large portrait of Mr. Bryan clad in a German uniform, and wearing a *casque à pointe;* and no German will be pleased at the latest portrait of the Kronprinz in the Parisian weeklies.

The Constitutional Convention

ESSENTIALS OF THE NEW INSTRUMENT FRAMED AT ALBANY—SHORT BALLOT AND RESPONSIBLE GOVERNMENT.

By SETH LOW.

The New York Constitutional Convention was called upon to deal with a number of problems of vital interest to the people of the State. In the last twenty years governments of every kind all over the world have been taking upon themselves new duties. The State of New York offers no exception to this general procedure. The result is seen in the very large increase of annual expenditure on the part of the State, and in the corresponding increase of the agencies which have been created to attend to the business of the State. The Convention found that there were over one hundred and fifty boards, commissions, and departments engaged in carrying on the business of the State. For the most part, these governmental agencies are independent one of another and of any adequate supervision from any source. In other words, the administrative system of the State, if that can be called a system which has never been systematized, like Topsy has "just growed." As a result there is little teamwork among departments, and no sense of responsibility to any common authority. The situation is made still worse by the habit of "ripper" legislation which each party in turn, when in the majority, has indulged in freely during the last twenty years. This has made any permanent policy impossible in the departments so affected, with the result that many of the most important interests of the State have been made the plaything of politics.

The proposed new Constitution deals with this problem radically. It provides for seventeen permanent departments, to one or the other of which all existing governmental agencies of the State must be assigned, as well as every new bureau that may hereafter be created. Of these departments, two are filled by election; the Controller being elected to be the head of the Department of Finance, and the Attorney-General to be the head of the Department of Law. The other fifteen departments, being partly or wholly executive in character, are under the charge of officials appointed by the Governor and responsible to him, except the Department of Education, which remains under the charge of the Board of Regents, who are elected by the Legislature. As to this department, no change whatever is proposed. Besides the Department of Education there are four others whose duties are partly executive, but quite as largely discretionary. These are the Department of Labor and Industry, the Department of Public Utilities, the Department of Conservation, and the Department of Civil Service. Each of these departments is headed by a board appointed by the Governor, by and with the advice and consent of the Senate. The terms of the commissioners in every case expire serially, and every commissioner is appointed by the Governor for a term longer than his own. It is hoped in this way to obtain continuity of policy in the management of these great public interests, together with a certain responsibility to the Chief Executive of the State. The other ten departments are administered by officials appointed by the Governor, without confirmation by the Senate, for terms coterminous with his own. These officials the Governor is at liberty also to remove at his discretion.

The proposed Constitution thus removes the danger of "ripper" legislation, partly by depriving the Legislature of the opportunity to indulge in it, and partly by removing the motive for it. No doubt, one principal motive for "ripper" legislation has been the partisan desire for patronage; but behind this bad motive there has been a good one, namely, the feeling on the part of each party to whom the electorate have given their confidence that with confidence should go the opportunity to control. Under the proposed Constitution the Governor of the State will have the same relation to the administrative departments of the State as the Mayor of the city of New York now holds towards the administrative departments of the city. The control of the Governor over the executive business of the State is no doubt greatly increased by these proposals, but the power is not increased more than the responsibility. Both the Governor himself and the party which is responsible for him must stand or fall upon his record. No excuse for failure can be found; for the power is equal to the opportunity, and, when this is so, responsibility cannot be evaded.

With the increase of the business of the State the financial methods of the State have become as inadequate as its administrative methods. With the growth of the State's business it has become increasingly difficult during the stress of a legislative session for the Legislature to make appropriations that really fit the need. There is not the time or facilities or opportunity for each new Legislature to acquaint itself with the business of the State in such a way as to enable it to meet the absolute needs of the State or to control discretionary expenditures with good judgment. As a result, the proper relations between the Executive and the Legislature as to appropriations have become oddly reversed. The natural course evidently is for the Executive to say what money is necessary for the conduct of the State's business, and for the Legislature to say how much the Executive may have. As our Constitution stands at present, the Legislature makes its appropriations, and the Governor receives the authority to veto any item he pleases. Thus the Legislature has the first word and the Governor the last. By the proposed Constitution the situation is reversed. The Governor is called upon to submit a budget showing how much money is necessary and how it may be provided, leaving with the Legislature the right to say how much money may be spent and how it shall be provided.

The sinking funds of the State have been so carelessly administered as to provide an excess of $29,000,000 beyond what is needed at the present time for the redemption of the bonds of the State as they fall due. The proposed Constitution provides against any further excessive taxation in connection with existing sinking funds, and it also provides for the issuing hereafter of serial bonds only, running for not more than fifty years.

The counties of the State from the beginning have been integral parts of the governmental machinery of the State. At the present time the various counties differ from one another essentially in population and in other conditions; but all are compelled to have substantially the same crude form of government. This form of government answers reasonably well still for counties that are entirely rural; but it does not answer at all for a county like Westchester, which contains within its borders four cities and which has a population of over three hundred thousand. Other counties having similar problems are Albany, Nassau, Schenectady, Onondaga, Monroe, and Erie. The proposed Constitution authorizes the Legislature to establish different forms of goverr ment which may be adopted at their pleasure by the voters of the different counties. This plan avoids hurtful uniformity on the one hand; and, on the other, it protects every county from having to form a government of which the electorate does not approve. The Legislature retains authority to pass general laws affecting counties; but it is made impossible for it hereafter to pass laws affecting one county only, except upon the request of the governing body of the county. In other words, provision is made in the pending Constitution for home rule for counties.

The question of home rule for cities was quite as pressing as that of home rule for counties, but the problem involved was very much more difficult of solution. The Greater New York Charter is the growth of 250 years, and it is roughly estimated that the body of statute law under which the business of New York city is carried on embraces ten thousand statutes. The city contains half of the population of the State, and approximately 70 per cent. of the wealth and resources of the State, and its activities and needs affect the entire commonwealth. But New York city is only one of fifty-six cities within the borders of the State, of which forty-six have less than 50,000 inhabitants. In one aspect this variety of condition constitutes a very strong argument in favor of home rule; but in view of the whole trend of American law, the difficulty of dealing with the problem is enormous. The average man thinks that he has solved the problem when he says,

"Give to the cities the control of their local affairs, and to the State the control of its affairs"; but such a man does not realize that there is almost nothing which a city does in its governmental capacity which it does not do as the agent of the State. Besides this, the Charter of the city of New York, especially, and other city charters only less, embody so many details that hardly any new step can be taken or any new governmental agency created which does not involve an amendment of the charter. This means that home rule for cities practically necessitates the power of continuous charter amendment at home.

Charter revision in its large aspect is necessary only occasionally; but the power of charter amendment is a continuing necessity both before and after charter revision if a city is really to be able to manage its own affairs. If cities were little States they could amend their charters as a State amends its Constitution; but they are not, either in this country or in any country. They are local communities which have received such powers as they enjoy from the sovereign State. In this country the courts have held that a municipal corporation is a corporation like any other, whose rights and powers are to be interpreted very narrowly. Any provision of home rule for cities, therefore, must first of all preserve beyond all question the sovereign power of the State; and it must, nevertheless, give so large a grant of power to the cities that a city can control its own affairs and adapt its governmental machinery, from time to time, so as to meet new needs. The proposed home rule amendment endeavors to meet this difficult problem adequately. It gives to the cities exclusive control of their own property, affairs, and municipal government; and within this field it forbids the Legislature to enact any law which applies to less than all the cities of the State, without classification or distinction. It permits the cities, by the action of the government of the day, to amend their charters after due notice and public hearing; but it provides that when such amendments change the framework of the city government or modify restrictions as to issuing bonds or contracting debts, such amendments must be submitted to the Legislature before becoming effective. The Legislature receives the right, for a limited period, to annul any such amendment; but unless the Legislature does actually disapprove the amendment, it takes effect as law when the time limit has expired. Every city receives the authority to elect from time to time a commission to revise its charter, and such revision is to be submitted to the people for approval. When approved by the people, it is submitted to the Legislature, which has for a limited period the same right of disapproval which is given to it with reference to charter amendments such as affect the framework of the city government.

The proposed home rule amendment has one feature which is new. It has been found in other States that, no matter what language is used to describe the grant of power made to cities under the Constitution, the courts are called upon to determine the meaning of this grant whenever it relates to matters as to which the city acts as the agent of the State. The pending home rule amendment recognizes this difficulty, and endeavors to meet it by making the action of the city valid, even when it amends its charter or some local law that relates to a question of State concern, until and unless the State takes action that is inconsistent with the city's action. In that event, if the courts hold the matter to be of State concern, the action of the State will override the action of the city; but until the city's action is thus overridden by the State the city's action will be valid. The analogy for this provision is found in the Interstate Commerce clause of the United States Constitution as interpreted by the Federal courts. The action of Congress within this field is paramount; but, until Congress does act, there is a very broad field affecting interstate commerce within which the action of the States will stand.

All of the things of which I have heretofore spoken affect the people of the State as citizens of the commonwealth; but the action of the Convention with reference to judicial procedure may affect each one of us as an individual. While the form of the Convention's action affecting the courts is technical, the substance of it is easily made clear to a layman. First of all, provision is made for clearing the clogged calendar of the Court of Appeals, and for keeping it clear. Then, within the city of New York, the jurisdiction of courts which has been local has been extended over the whole city, so that a shortage of judges in one neighborhood may be made good from another neighborhood. Thus the efficiency of these courts will be greatly increased, with very little addition to the expense. The higher courts of the State receive more control over the Civil Practice Rules. The Legislature is not deprived of its authority to enact a Civil Practice act and to adopt a separate body of Civil Practice Rules for the regulation of procedure in the Court of Appeals, the Supreme Court, and County Courts; but the Legislature is called upon to do this work at intervals only, and then by enacting a single bill to be based upon the report of a commission. In the intervals of legislative action the courts may modify or amend these rules in the light of experience. It is believed that these proposals, if adopted, will facilitate the administration of justice by making it both more prompt and less costly.

The Convention took other action which is important, but these appear to me to be the main subjects with which it was called upon to deal. That it could handle questions of this kind so radically without a division on partisan lines seems to justify the belief that its proposals are conceived in the interest of the commonwealth, and that they ought to be approved by the people of the State.

Book Notes and Byways

THE GROWTH OF "THANATOPSIS."

The centenary of the *North American Review* calls to mind a paradox which is too cutting not to have been made by the neat hand of time. It is, that an age which fondly names itself pagan should have grown cool towards a poem, as pagan as Lucretius, which had its great prosperity in days when it was half an act of worship to learn "Thanatopsis" by heart. There have been critics to point out that the poem, although born of a mood to which Bryant had been stirred by writers as orthodox as any in the language, has not a word of sin, or God, or immortality. But no one, it seems, has shown by what steps the young poet moved from his first callow gloom, when Kirke White was congenial, to the broad and noble consolation for death which a hundred years have hardly surpassed.

During the autumn of 1811, not long after he had learned that his father could not send him to Yale, Bryant, then deep in youth's own melancholy, read Kirke White's "Remains." It is not strange that he was powerfully moved. White, too, had been a poet, young, unfortunate, doomed to a quick death and a short fame. There was real pathos in his story, and Bryant, one may guess, saw the pathos more clearly than the morbid color of death which tinged every line. What in White was disease, haunting his sick senses with worms and graves, with the "melody of death," with death's "sweet decaying smell," and breaking his heart with the thought that he must soon be cut down and forgotten like a tree, to Bryant was only a mood and an idea. He was a young poet filled with compassion for his fellow in art. And more, he was a young mortal, for whom the name and image of death, though not new, for he was also a Puritan, had suddenly changed from a vague dream to a sickening menace. Mortality, that is to say, thrust itself upon a mind which had concerned itself only with the immortalities of youth and poetry.

Brooding upon these threats of fortune, he turned to other poets who had touched the theme. He read Blair's "Grave" and Beilby Porteus's "Death: A Poetical Essay,"* "observing how much the verse of the obscure Scottish minister excelled in originality of thought and vigor of expression that of the English prelate." They were kindred spirits to whom death was a folk-lore demon lurking in the dark and preying upon mankind with horrible malice. But Blair and Porteus, unlike White, did not themselves cower before death; they had set out, in Blair's words,

> To paint the gloomy horrors of the *tomb*,

partly that men might not forget to be holy in this life. Death was a tool to their piety. A little more aloof from death than White, they were thus more general in their view of it, and Bryant, through them, saw death as the common fate of men, and not as the ugly blighting of one man's hopes. Moreover, of the two, Porteus was the less concerned with those facts of death which weigh upon the senses; Bryant's preference for his work seems to point forward to the calm of "Thanatopsis."

*Seaton prize poem at Cambridge in 1759.

Such calm, however, is not very close to the anxious mood in which Bryant had begun to think of death. Somewhere between that and the firm ground on which he finally stood are the lines which, by an error, were printed at the head of "Thanatopsis" on its first appearance.

Not that from life, and all its woes
The hand of death shall set me free;
Not that this head, shall then repose
In the low vale most peacefully.

Ah, when I touch time's farthest brink,
A kinder solace must attend;
It chills my very soul, to think
On that dread hour when life must end.

In vain the flatt'ring verse may breathe,
Of ease from pain, and rest from strife,
There is a sacred dread of death
Inwoven with the strings of life.

This bitter cup at first was given
When angry *justice* frown'd severe,
And 'tis th' eternal doom of heaven
That man must view the grave with fear.

In these lines Bryant seems to say, if one may take them as his own opinion, that he can find no escape from the dread of death in such comforts as the chance of a future life or of future quiet or of future fame. There was still the question how to face death, and a hint at his answer was in Blair:

What is this world?
What but a spacious burial-field unwall'd,
Strew'd with Death's spoils, the spoils of animals
Savage and tame, and full of dead men's bones!
The very turf on which we tread once liv'd;
And we that live must lend our carcases
To cover our own offspring: In their turns
They too must cover theirs.

But Bryant took from this more than was intended. Blair had meant scorn and pity for mankind when he said that flesh comes from grass and will be grass again. Bryant, reverent towards nature from childhood, saw no loss of dignity in this transition to other elements. One would go back to be a part of beauty and grandeur; one would have the world for a monument. If death was dreadful, it was also a proud and splendid portal through which men might pass from their narrow province to a universal state.

Bryant had now gone so far from his starting-point that his present thought was really an answer to the bitter questions of Kirke White. This has been overlooked, but it is one of the central facts of "Thanatopsis." White, in his lines, "Written in the Prospect of Death," had said, with painful bathos:

Fifty years hence, and who will hear of Henry?
Oh! none—another busy brood of beings
Will shoot up in the interim, and none
Will hold him in remembrance.

To this Bryant, freed by his thought from such shrinking at oblivion, made the austere reply:

—and what if thou shalt fall
Unnoticed by the living—and no friend
Take note of thy departure? Thousands more
Will share thy destiny.—The tittering world
Dance to the grave. The busy brood of care
Plod on, and each one chases as before
His favorite phantom.—Yet all these shall leave
Their mirth and their employments, and shall come
And make their bed with thee!

Thus the first version of the poem closed abruptly with a reproof to morbid terror. It had begun abruptly with the seventeenth line, as the poem now stands;

—Yet a few days, and thee,
The all-beholding sun, shall see no more,
In all his course.

It becomes clear at once that Bryant, when he wrote the poem, meant it as a challenge either to Kirke White or else to the mood which White had engendered in Bryant's own mind. He mused over the certainty that he, or White, must lose "each human trace" and "mix forever with the elements." But he remembered the splendor "of the great tomb of man" and the infinite tribes that "slumber in its bosom." Then follow the question and answer by which he closed the argument.

Whether Bryant revised his poem between October-November, 1811, and September, 1817, when it was printed, does not appear; probably he did not, since Dr. Bryant sent it to the *North American* without his son's knowledge. But before it appeared in the 1821 "Poems," it had undergone certain changes of which the full import has not been pointed out. In part, they were merely verbal and always in the interest of greater felicity and eloquence. The "busy brood," White's own words, became a "solemn brood." A glance at the opening, however, will show that the most notable change had been to put the whole substance of the piece into the mouth of nature, which thus became responsible for its wisdom. At first, the poet had spoken in his own person. Death was remote and his terrors moved only the imagination. It was easy, then, for Bryant, who saw that dread had loosened the sinews of Kirke White, to offer his stern remedy. But now he was unwilling to leave in the poem so personal an air. Only the year before, he had begun a "Hymn of Death" to sing death's praises, chiefly for the noble justice with which death levels all men and avenges the good against the wicked. In the midst of such swelling rhetoric, he had broken sharply off, for his father had died, and he had seen how idle was his attempt to make death the servant of his scheme of moral justice. When he came, therefore, to his revision of "Thanatopsis," he had less reason than ever to accept the smug doctrines which he had so scrupulously kept out of his first version. He could not even speak his own answer to the question with his old assurance. Nature had consoled him before when he had feared death; now nature, the agent of death, must offer consolation. She has, he said, a language which suits all moods, even the darkest.

When thoughts
Of the last bitter hour come like a blight
Over thy spirit, and sad images
Of the stern agony, and shroud, and pall,
And breathless darkness, and the narrow house,
Make thee to shudder, and grow sick at heart;—

(here he summed up the fears and speculations to which he had made his earlier answer, setting the stage, so to speak, to reproduce the atmosphere of the original scene)

Go forth, under the open sky, and list
To Nature's teachings, while from all around—
Earth and her waters, and the depths of air—
Comes a still voice—

And then nature, with her great authority, was made to utter the response by which the courage of Bryant had answered his gloom ten years before. It will be noted that nature's words do not seem wholly in keeping. When she tells man that he will return to earth, she does not seem to be speaking of herself, but of a separate state:

surrendering up
Thine individual being, shalt thou go [not come]
To mix forever with the elements.

And her promise that he will sleep among men in death is perhaps rather a human consolation than one that might be expected to come from the contained and gradual spirit which for Bryant was nature. Of this the poet seems not to have been conscious; at least, he cared more to hide himself than to give full consistency to his speaker. At the end he added a few lines upon the ages of death which remain and then rounded out the whole with the famous counsel to a life of virtue which can make fortitude instinctive at the final summons. By this didactic close he does, indeed, partially falsify nature; he avoids the falser note of any promise of a future life. Nature, he knew, makes no such promises. This reserve is Bryant's peculiar triumph. He had moved from that first stage of personal dread, with steadily widening thought, to a view of death which was no longer obscured by the desires and prejudices of fearful mortality, but which, in its calm acquiescence in inviolable law, was worthy to be ascribed to nature.

Poetry

SAINTE JEANNE OF FRANCE.
1915.

By Marion Couthouy Smith.

Sainte Jeanne went harvesting in France,
But ah! what found she there?
The little streams were running red,
And the torn fields were bare;
And all about the ruined towers
Where once her king was crowned,
The hurtling ploughs of war and death
Had scored the desolate ground.

Sainte Jeanne turned to the hearts of men,
That harvest might not fail;
Her sword was girt upon her thigh,
Her dress was silvern mail;
And all the war-worn ranks were glad
To feel her presence shine;
Her smile was like the mellow sun
Along that weary line.

She gave her silence to their lips,
Her visions to their eyes,
And the quick glory of her sword
She lent to their emprise;
The shadow of her gentle hand
Touched Belgium's burning cross,
And set the seal of power and praise
On agony and loss.

Sainte Jeanne went harvesting in France,
And oh! what found she there?
The brave seed of her scattering
In fruitage everywhere;
And where her strong and tender heart
Was broken in the flame,
She found the very heart of France
Had flowered to her name.

Correspondence.

THE WAR FUND OF THE MODERATES.

To the Editor of The Nation:

Sir: After reading O.'s letter in your issue of September 16 and your editorial thereon, I hasten to agree to be one of nine to send $2,000 to war relief funds, the condition of "O.'s" offer, and will send the same whenever you say the agreement is binding. Please suggest to me the four *biggest* and *most deserving* funds. I prefer to split my contribution of $2,000 into four, of $500 each.

W. R. F.

Boston, Mass., September 29.

A WORD TO THE MODERATELY POOR.

To the Editor of The Nation:

Sir: The pulpit of Plymouth Church, Brooklyn, is one of the most conspicuous in America. No American Protestant clergyman, perhaps, is more widely known than its present occupant. When we consider the splendid opportunity he has had for a career no less distinguished than useful, bringing rewards altogether incommensurable with things so commonplace as wealth and power, his recent public confession, though it justify the sternest indignation, brings to mind first of all the childishness of the whole business. But let not the world's people exult if a minister of the church has been brought low. His obligation to disinterested benevolence was no greater than theirs. It is one of their number, I suppose, who at about the same time writes to the *Nation* in words of quite unconventional plain truth: "As one of the moderately rich . . . I want to express my conviction that the great majority of us, including myself, are acting like hogs."

The apathy of the American people in these times is not surprising. The disregard of Germany for law, justice, and common humanity, however foolishly short-sighted it may be, is morally the logical outcome of a state of things in which, throughout the civilized world, in the church and out of it, a minority whose struggle for means to live is not too strenuous to admit of thoughtfully facing the facts has tacitly elected to be selfish and let remediable distresses of man and beast go unremedied. The writer of these lines is not rich, "moderately" or otherwise. He has not withheld his hand so much, all things considered, as "one of the moderately rich" confesses that he has done; but in view of the needs that confront him he has in these days been doubting the wisdom of his own prudence. Is not this the time for a somewhat reckless regard for the obligation to give? What matters it if we who are "moderately" poor take some risk of dying in a hospital ward, as soldiers die, rather than in one of the comfortable private rooms? I should like to hear through your columns from persons whose total wealth is less than our friend's minimum income of $10,000. I enclose my check for $100, and ask you to apply it for war relief wherever you think it is most needed.

K.

COLE'S NIAGARA FALLS.

To the Editor of The Nation:

Sir: I should like to inquire through you if any of your readers are aware of the present whereabouts of the picture of Niagara Falls by Thomas Cole, of which there is an engraving in Hinton's "History of the United States," second edition, 1843, and also I believe in the first edition of 1834. I should be glad to know when it was painted and what has become of it, and would welcome any information which would point in those directions.

Edward E. Hale.

Union College, Schenectady, N. Y., September 13.

THE FRENCH UNIVERSITIES.

To the Editor of The Nation:

Sir: So many Americans are looking to France for their education nowadays that the following extract from letters received from Professor Hauvette, of the University of Paris, will be of general interest:

"Nothing is changed in our courses, in spite of the prolongation of the war; as the professors of the Sorbonne are not generally young people, very few have been mobilized, and our courses are nearly complete. The only courses suppressed are the *concours* (agrégations, certificats d'aptitude pour les langues vivantes), but the *examens* (licences, diplôme supérieur, doctorat, etc.) have not stopped a single day, and our old students will find here courses and libraries open as usual. There are only fewer students!

"We have not budged from Paris for a single day (except for vacation). The theatres are open; some of the museums are closed, having been dismantled earlier."

Programmes for the winter session of the Paris schools may be had on application, Professor Hauvette states. There is no reason why Americans who have planned to spend this year in study in Paris should not do so. Rather, is not this a good time to show their loyalty and affection in increased measure by supporting French educational enterprise?

"CONTINUOUS MEDIATION WITHOUT ARMISTICE."

To the Editor of The Nation:

Sir: May I be permitted to offer a reply to a criticism of my pamphlet, "Continuous Mediation without Armistice," from a London correspondent of the *Nation*, in your issue for August 12?

"We are hardly willing to accept the theoretic assumption," writes your correspondent, "that, because all the belligerents claim to have right on their side, they are likely to be equally wrong."

First, may I state that no assumption was intended in my pamphlet that the belligerents are all equally wrong? The reference to the difficulty of making a final moral judgment had to do—or was intended to have to do (the wording is not so clear as it might be)—not with the concrete justice of the case looked at from the international standpoint, but with the sincerity of various national points of view. The writer regrets that the sentence "There is a sense in which all are to blame" was not written "There is a sense in which we are all to blame," for in her thought the word "all" included the neutral peoples as well as the belligerents. To this, the next sentence of the pamphlet is witness. "We are all human together, stumbling out of darkness into a twilight of imperfect knowledge."

It is quite true, however, that the writer deliberately avoided discussing moral issues in national terms. That she did so was not because of any wish to minimize the moral issues involved, but for a reason which we believe your correspondent would be among the first to appreciate. There are times and places in which it is right and necessary to call things by national names; there are times and places in which it is justifiable to avoid doing so. "We cherish no bitterness against the German people as such," writes your correspondent, "but we have an undying hatred for the principles for which Germany stands. Our dearest hope is for a revolution in German thought, or (as I should prefer to put it) for a domestic triumph of the best elements of the German people. We would much rather see the patient restored to sanity than confined in a strait waistcoat." This being his sentiment, does he not understand that it would be a justifiable human relief under some circumstances to discuss the whole matter *in terms of principles instead of in terms of peoples?* It was the earnest desire of the writer of the pamphlet to find some common ground, however slight, on which estranged friends could meet, which could serve as a basis for propaganda in all countries—a propaganda in which even one who dissented from the action of his Government might work for the international cause without feeling that he was a traitor either to his nation or to his convictions—a propaganda in which people who, because of various biassing influences, are divided in opinion as to the sincerity of the Governments, the responsibility for the war, the attitude which the nations will take in the settlement, can work together, provided only they are agreed in desiring a permanent peace based on principles of international righteousness.

"There is no place now," writes your correspondent, "for those who wish to ride off on a general condemnation of war; some decision must be made, on the merits of the case. . . . We shall hold out, not for any vainglorious triumph or material advantage, but until (if human strength avail) the priceless principles at stake are vindicated and accepted by our enemies as well as by our friends." I wish to point out that my pamphlet, far from assuming that no decision is to be made on the merits of the case, endeavors to suggest a method by which such a decision might perhaps be arrived at with the greatest economy of life and treasure. I quote phrases from Miss Addams's definition of the plan—clearer and more specific than that in the pamphlet: "It is suggested that an International Commission of experts be formed without delay on neutral initiative. The Commission should sit as long as the war continues. The members should have a scientific but not a diplomatic function; they should have no power to commit their Governments. The Commission should explore the issues involved in the present struggle and in the light of this study begin making propositions to the belligerents in the spirit of constructive internationalism. If the first effort fail, they should consult and deliberate, revise their original propositions or offer new ones, coming back again and again, if necessary, in the unalterable conviction that some proposal will ultimately be found that will afford a practical basis for actual peace negotiation."

Now this continuous process of semi-official mediation may, if necessary, be indefinitely lengthy, the war, of course, being in progress in the meantime. Since all decisions rest with the belligerent Governments, nations feeling

that they are fighting for international righteousness are as free as ever to insist that their principles be accepted by their opponents and to exact guarantees of good faith. The advantage of the plan seems to us to be that a recalcitrant Government has perpetual opportunity to signify acceptance of "the priceless principles at stake," and that the various elements of its people, both individuals and groups, have definite occasion to bring pressure to bear on their Government in favor of such acceptance. It is our earnest hope that some such plan, if carried out, would tend to give speedy victory to the right—would tend to thwart wrong motives and to assist and reward right motives in every country. JULIA GRACE WALES.

Madison, Wis., September 20.

MISQUOTATIONS.

TO THE EDITOR OF THE NATION:

SIR: May I venture to add to Mr. R. W. Shannon's dictionary of misquotations a single example from Max Eastman's "Enjoyment of Poetry"? It is a trifling error, yet, as a literary phenomenon, not wholly lacking in significance. Mr. Eastman is discussing the popular ballad; by way of illustration, he quotes the whole of "Bonnie George Campbell," the second stanza in the following form:

Down ran his auld mither,
Greetin' fu sair,
Out ran his bonny bride
Reaving her hair;
"My meadow lies green,
And my corn is unshorn,
My barn is too bigg,
And my babe is unborn."

And Mr. Eastman adds this comment: "These ballads of the people, though they derive from the fingers of time a touch of perfection not their own, were none the less surely the work of poets. They have a discrimination of emotional atmosphere, an occasional poetic word used with exquisite regard to that, which proves the receiving mind.

My barn is too bigg

was the choice of a genius."

It would be interesting to know who that genius was. He was not one of the composers or transmitters of the four popular versions or fragments printed by Child, for these, where they have the phrase at all, have "My house is unbigged" (A) or "My barn is to build" (D—which is, of course, the meaning). He was not the editor of any one of the collections accessible to me, he was not Cunningham, who quotes Child's D; he was neither Allingham nor Motherwell, who read respectively "to bigg" and "to big." Who was he? Is it possible that he was Mr. Eastman himself?

Whoever he was, he seems to have quoted from memory; in neither phrasing nor arrangement is his version of the ballad precisely like any that I know. He repeats Allingham's mistake of "Reaving [robbing] her hair" for "Riving [tearing] her hair"; but otherwise his version is no more like Allingham's than it is like Motherwell's. Apparently, then, we have an illustration of corruption in transmission no less interesting than the distorted version of Henley's "Invictus" quoted by Professor Gummere in his "Popular Ballad" from the question-column of a newspaper. "The inquirer," says Dr. Gummere, "is an educated person." Mr. Eastman's genius, however, has fallen into an error typical of the uneducated and characteristic of the oral transmission of poetry. He has failed to understand, and for an unfamiliar word he has substituted a familiar one, as when, in the instance cited by Professor Child from the ballad of "The Gypsy Laddie," "they cast their glamourie owre her" is turned into "they called their grandmother over."

Is "too bigg," after all, the "choice of a genius"? It is a matter of taste, and in a matter of taste Mr. Eastman is likely to be right. Yet I must confess that I prefer "to bigg" as more poetic, more consistent with the context and with the emotional atmosphere. Again, if one writes about these ballads of the people, should not one write about the popular or traditional versions? But that, of course, Mr. Eastman may have done. It would be interesting to know.

WALTER MORRIS HART.

Berkeley, Cal., September 3.

Notes from the Capital

ALEXANDER GRAHAM BELL.

While battle-lines in the European war are doing their fighting on orders communicated by telephone from airships, it is natural that the name of Alexander Graham Bell should be on the lips of every well-read visitor to Washington, his career having been so largely associated with the transmission of the human voice by wire and with aerial navigation.
